MATHEWS ORCHARD DISC PLOWS

THIS is a simple and compact plow of few parts. Can be had either with one or two discs. Works close up to trees. Will penetrate the hardest soils and the heaviest cover crops without any tendency to get out of the furrow. The front furrow wheel is easily pivoted for turning to or from trees.

The strong simple construction of this plow embodies many attractive features which add to ease of operation.

OLIVE TREES

OLIVES WORKED ON PICHOLINE ROOT have a stronger growing and deeper feeding root system than those grown from cuttings. Mission Olives worked on Picholine Root are more thrifty, grow larger, and are more heavily productive—that means more profit.

The foundation of your trees is THE important feature. In addition to working our Olives on Picholine seedling, we cut our wood from a fine strain of trees having a good record for productiveness and size of fruit.

In buying trees, you want the best—the first cost is no consideration. We have a limited number of Olives on Picholine. Write us now and reserve the trees you want.

JUDGMENT based on EXPERIENCE is a sure GUIDE to success.

READ AND PROFIT BY THE FOLLOWING:

Poppy Ridge Ranch, Elk Grove, Cal., Sept. 26, 1914.

De Laval Dairy Supply Co.:

Are we pleased with our silo? We certainly are, and here are some of the reasons why.

It is made out of the right stuff, and in the right way for this climate. As you know, ours is the one you had at the State Fair in '13. It was moved down to the ranch and put up about October 1st. Stood empty all winter, was filled in April with alfalfa, empty by July, and filled again in September with corn. The hoops have never been touched. There isn't a check in it, nor has a single seam started.

We fed alfalfa silage three months in place of cutting and feeding green alfalfa every day. The cows milked just as well, we saved on labor, and the silo enabled us to turn into the best of feed a first cutting that, as hay would not have been worth handling.

We figure that the silo, by enabling us to preserve corn in a succulent condition for winter feeding, will so balance our ration that it will not be necessary to buy any concentrates to keep our herd up to their best. Even if it cuts our bill for concentrates 50 per cent. the silo will pay for itself this year.

It preserves the feed perfectly. We did not lose a particle of silage from mould even next to the doors.

We expect to fill it next spring with barley and vetch and again in the fall with corn, thus getting two crops in one season from the same land. We have not been able to do this before to advantage except with alfalfa. If this plan is carried out we shall need another silo for first crop alfalfa, and we serve notice now that the Ideal Green Feed Silo will be it.

Very truly yours,

NEWMAN BROS.

COW TESTING AGAIN

Written for the California Cultivator
By F. E. Kaufman.

MUCH has been written the last few years relative to testing the dairy herd, but it would seem to the writer that no better time has appeared than the present for discussing this most important subject.

True, the price of alfalfa is so very low that many will say, "What is the use of going to all the trouble of weighing and testing the milk when the best cow feed that grows can be purchased for a song?" It will have to be a very poor cow indeed that will not pay her board with four and five dollar alfalfa, but the dairyman must keep in mind that it takes as much time to feed, milk and care for the cow as though he was paying 12 or 15 dollars a ton for hay. Then there is the value of the cow herself that must, or should at least, be taken into consideration.

Milk cows have practically doubled in value in the last three years and the outlook is for still higher prices. It has been a mighty poor cow that would not sell for $100 and from that to $160, while the writer has seen 18 months old heifers that would not freshen for six or eight months sold for $70. This statement has reference only to grades, for pure breeds have sold for two and three times that much money and have been worth every cent of it too for the reason that they have been tested and their dams before them have been tested, and further, they have been bred to sires whose dams have been tested, and there is no possible way for them to escape giving a good account of themselves if properly fed and handled.

In viewing a pure bred herd the prospective buyer first inquires as to the record of each individual, and then his curiosity—no, horse sense, is a better term—leads him to inquire into the records of the dam and granddam. Also he wants to know weight of milk and fat test of the sire's dam and granddam, and after he has made a careful study of all the records available he will be in a position to make his selections in a most intelligent manner.

If the keeping of such records is profitable, and it is, else they would not be kept, to the breeder of pure breds, why is it not profitable to the average dairyman who generally has an eye out for the improvement of his herd by selecting the best milkers and selling the others to his neighbors or the regular cattle buyer?

This alone should be sufficient to cause every dairyman to try and determine what his cows are doing, to say nothing of the advantages to be gained by knowing just which cows are making him money and how much.

A board with a sheet of paper tacked to it and properly ruled, hung up beside a spring balance at the milking place, and then a few minutes time to record the weights, and add them up at the end of the month, will do the business of keeping a milk record. Weighing the milk is the only true way to keep a record. How many times do you hear that "Old Brindle" gave a 14-quart pail heaping full last night when the real facts are that the pail would run over with 12 quarts in it and last night it was a full half-inch from being full, to say nothing of an inch or so of froth before you came to real milk? A 25 cent spring balance will do very nicely, although the regular milk scale, costing two to three dollars is better. Learn to think milk in pounds, but if you must know the result in gallons divide the number of pounds by 8.6 and your result will be gallons, which multiplied by four will give the number of quarts.

Ordinarily the creamery buying your cream will be glad to test samples of milk for you, and if you will take a composite sample of six to eight milkings about seven weeks after calving you will get an approximate test for your cow for that milking period. Then with your monthly milk record in pounds you can determine approximately the butter fat yield for the period of lactation and know to a certain extent if you are milking for the fun of the thing or for real dollars and cents. The better way would be to provide a Babcock tester and test once a month.

A composite sample of six milkings the last three days of each month gives good results and you will be better satisfied with the record at the end of the year.

A still better way would be to organize a cow testing association in your community and employ some one experienced in testing milk to superintend the weighing and testing one day out of each month at the farms of the different members.

Even though hay is cheap and the price of butter fat is low, do something and determine whether or not you were justified in paying $150 for that last cow purchased. You can at least find out if it will pay to keep the heifer calf dropped in much less time than it will take to have her become a cow and be fed and milked through two or three milking periods.

GOOD RESULTS FROM ANTI-HOG-CHOLERA SERUM

The treatment of hogs exposed to the risk of contagion from hog cholera with anti-hog-cholera serum has saved all but 2.27 per cent in the southern states, according to reports received by the United States department of agriculture from local agents engaged in demonstration work in this section.

These reports show that the county agents inoculated, in the year ending June 30, 1914, a total of 34,636 hogs that were in good health at the time but were exposed to the disease. Of this number only 787 died. This loss of 2.27 per cent is regarded as highly gratifying evidence of the value of the preventive treatment with anti-hog-cholera serum.

Although many authorities do not recommend this treatment after the hog is so sick that signs of the disease are plainly visible, the agents in many cases took a "fighting chance." The results would seem on the whole to have been very satisfactory. Including sick and well animals, a grand total of 41,974 hogs exposed to the disease received the serum. Of these 3,004 died, a percentage of loss of 7.15.

In considering these figures, scientists point out that the work was done under ordinary farm conditions and not by trained experts in laboratories. In addition a very large number of hogs were inoculated by veterinarians or by farmers themselves. In these cases no figures are available to show the exact results of the treatment.

Department experts also point out that inoculation alone is not sufficient and does not remove the necessity for sanitary and other precautions; for example, hogs should be fed for a few days after the treatment on cooling laxative foods. They should be removed to uninfected and clean pens where there is plenty of shade, and care should be taken to free them from lice and worms. Since many hogs are worm infested, the following formula, which has been used by local agents throughout the south with considerable success, is suggested by the Kentucky experiment station: Santonin, two and one-half grains; areca nut, one dram; calomel, one grain; sodium carbonate, one dram. This is a sufficient quantity for each 100 pounds of live weight. The dose should be given in slop in the evening after the hogs have been without food for from 12 to 24 hours. The following morning each hog should receive a tablespoon of epsom salts.

AMERICAN CHEESE SHOULD BE MADE POPULAR

American cheese makers are being urged by the United States department of agriculture to take advantage of the present excellent opportunity to establish a reputation for their product that will outlive the present disturbance in international commerce. European cheeses have long been popular in this country, and it is a popular belief that they cannot be equaled by the domestic product. For example, in the fiscal year, ending June 30, a total of 63,784,313 pounds of cheese were imported into this country. It is not yet possible to say to what extent this trade will be interfered with by the war, but it is certain that the imports for the current year will be much less than they have been in the past.

There is no reason why some of this deficiency cannot be made good at home if the farmers will furnish the milk. Already American cheeses have been made which rank in the opinion of experts fully as high as foreign cheeses of the same class. The popular preference for the imported product, however, has hitherto prevented these cheeses from selling on their own merits in competition with European products.

One of the most striking instances of this is Limburger cheese. In quality and price American cheese of the Limburger type long ago drove its foreign rival out of the market. Practically no foreign Limburger has been imported into this country for many years. Many consumers, however, have clung to the belief that they were eating a foreign cheese. There is no reason at all why they should not know that the American product is exactly as good as the foreign. Moreover now, that some of the more expensive types of highly flavored foreign cheeses are not likely to reach us for a long time, the demand for domestic Limburger should be greatly increased. The market thus created should remain a good one long after the present conditions have been remedied; for once the consumer becomes accustomed to the American product he is not likely to abandon it for a more expensive foreign one which is no more satisfactory.

Much the same is true of cheeses of the kind popularly described as Swiss. Cheese of this variety is made exactly as well at home as abroad. In the past, it is true, American makers have been confronted by several difficulties, but government investigations have solved many of these problems, and it is now possible for expert cheese makers to turn out Swiss cheese of uniformly high quality.

Camembert has been made in America with some success already. This variety has suffered more, however, from actual opposition by the promoter of the imported article than other kinds. Camembert is ripened quickly and reaches the consumer within a month of manufacture. This is, therefore, an opportunity for the American maker, freed from competition, to sell his article and by the fuller opportunity to work his factory, to perfect his method to such a degree as to hold that market when competition returns. Though more perishable than Cheddar, Swiss and some other varieties, this should not prove to be a serious obstacle to increasing the output, for Camembert of the best quality always commands a good price.

In addition to Camembert there are a number of other fancy foreign cheeses which are popular here and which could doubtless be imitated successfully by American cheese makers after a little experimental work. Among these varieties are Edam, Gouda, Parmesan, Roquefort, Stilton and Gorgonzola. Although there seems to be no reason why such cheeses should not be made in the United States, they do not in the opinion of experts offer at the present time the most promising field for American cheese makers. For the present at least it would probably be better for them to encourage the demand for standard types, such as Cheddar, Swiss, Limburger, pineapple, etc. The field for Cheddar is particularly promising because of the fact that the flavor of this cheese, while always distinctive, can be made to vary widely. This variation enables it to act as a substitute for a number of other varieties. In short the experts in the department of agriculture are confident that with care and foresight at the present time the American producers will do much to place American cheeses on a permanent equality with the European varieties and sweep away prejudice that has held back the industry in the past.

So long as the general public believes that the imported product is necessarily the best, the tendency on the part of the American manufacturer is inevitably to turn out goods that will sell because of their low price, not because of their high quality.

The best way to remedy this condition of affairs and to make friends for domestic cheeses of foreign type is for American makers to label their products frankly as American goods. This will give the consumers an opportunity to compare our best homemade products with the imported article. The result will be the removal of a long standing prejudice and an added incentive for manufacturers to improve the quality of their products. It is thought that this can be done and the price still kept below that necessarily demanded for imported cheese. But any temporary advantage gained by the present situation cannot be maintained unless American cheese makers work for quality of their products. Eventually, they will again be obliged to compete with Europeans who for generations have looked upon cheese making as a fine art.

THE WAR AND GUERNSEY CATTLE

The following clipping from the Guernsey Advertiser, published on the island of Guernsey, is sent us by Mr. Roberts, a Guernsey admirer at Oleander:

"The outbreak of war and the issuing of the royal proclamations prohibiting the exportation of foodstuffs, brought the Guernsey cattle trade with America to a standstill. Fortunately for the farmers and dealers the bulk of the year's trade was over. One consignment of 90 head was being made ready for shipment at the end of this month, and, if the war is over, there will be a shipment of 100 head in October, which would practically be the last for the year.

"The war may be almost regarded as a blessing in disguise for the cattle trade, for the number of animals that can be exported in any one year is limited, and more cannot be exported without reducing the stock that ought to be kept here, if the cattle industry is to go on.

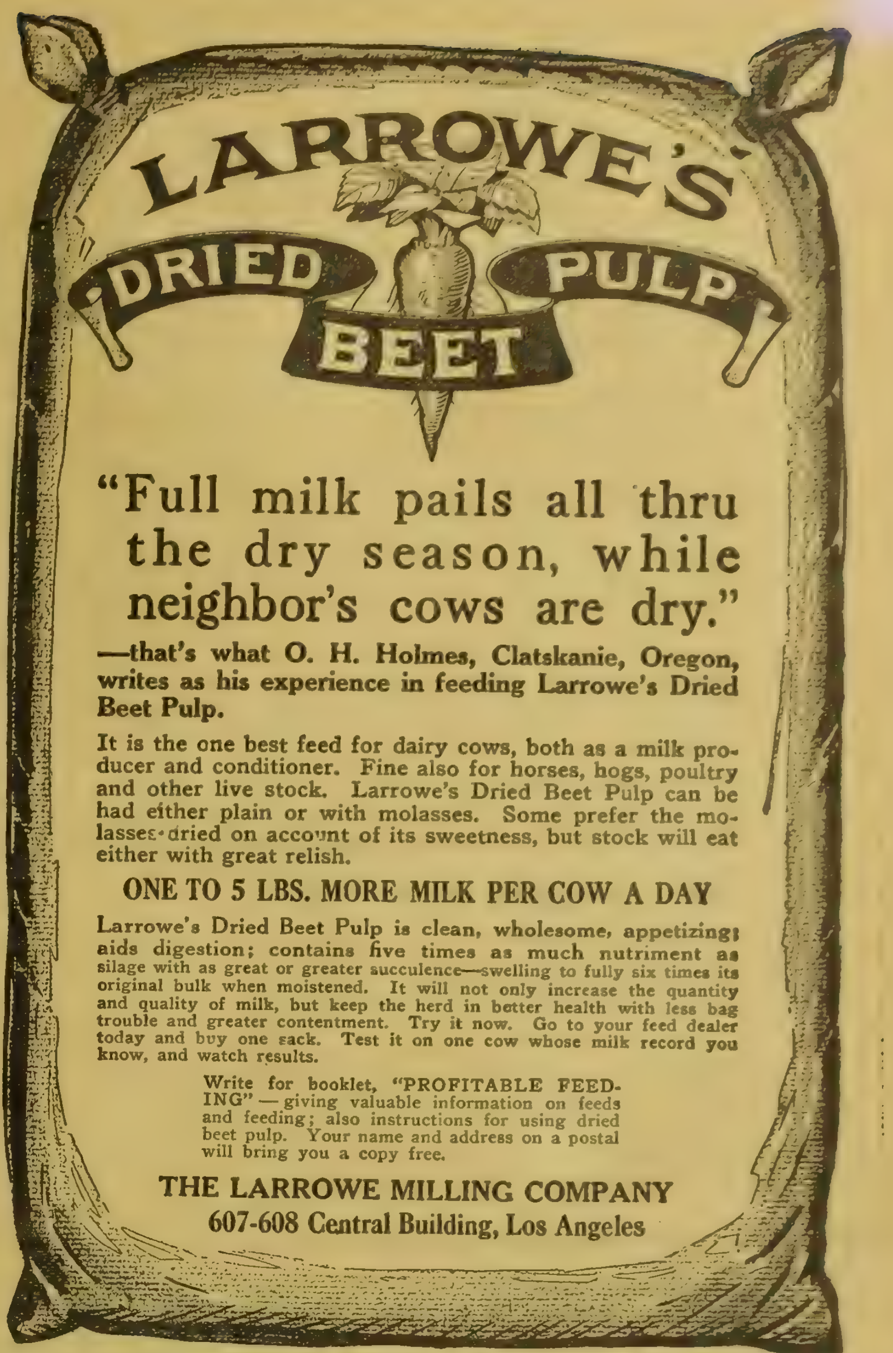
"The area available for cattle on the island is fast being restricted by the putting up of more and more greenhouses, and preserving the stock is becoming an urgent necessity. For the present the war is an artificial bar to the export of too many cattle.

"Up to this month some 700 head of cattle had been exported from Guernsey this year, representing a money value of at least £20,000. Another £5000 would be realized by the consignments held back.

"Every year there are about 3000 calves, of which half are converted into veal. Of the 1500 heifers, some 300 are required to replace the stock of cows, which have to be killed owing to old age or other causes. Another 300 may be regarded as unsuitable for export, owing to their having black noses or other defects or shortcomings, so that from 800 to 900 head is all that can reasonably be expected to be exported in any one year. With a total of 700 already sent away, it will be seen that up to the present those interested in the cattle export trade have not been seriously hit by the war, and in the end it may benefit by its effect in preventing too heavy a drain of the local stock.

"It is estimated that there are about 7000 head of cattle on the island. Not more than a dozen Guernsey cows, if so many, are killed week by week for food."

The boar needs pasture as well as do the other hogs or other stock.



"Full milk pails all thru the dry season, while neighbor's cows are dry."

—that's what O. H. Holmes, Clatskanie, Oregon, writes as his experience in feeding Larrowe's Dried Beet Pulp.

It is the one best feed for dairy cows, both as a milk producer and conditioner. Fine also for horses, hogs, poultry and other live stock. Larrowe's Dried Beet Pulp can be had either plain or with molasses. Some prefer the molasses-dried on account of its sweetness, but stock will eat either with great relish.

ONE TO 5 LBS. MORE MILK PER COW A DAY

Larrowe's Dried Beet Pulp is clean, wholesome, appetizing; aids digestion; contains five times as much nutriment as silage with as great or greater succulence—swelling to fully six times its original bulk when moistened. It will not only increase the quantity and quality of milk, but keep the herd in better health with less bag trouble and greater contentment. Try it now. Go to your feed dealer today and buy one sack. Test it on one cow whose milk record you know, and watch results.

Write for booklet, "PROFITABLE FEEDING" — giving valuable information on feeds and feeding; also instructions for using dried beet pulp. Your name and address on a postal will bring you a copy free.

More About Butter Quality

W. H. Roussel of San Francisco says that the only solution of the quality problem is to so legislate that every one concerned, from the dairymen producing the milk to the buttermaker and the seller, shall be compelled to do their work properly. The uniformly good quality of New Zealand butter was cited as an example of legislative results. But free American citizens might consider such drastic regulations as restrictions upon their rights. Australian butter is now inferior in quality to New Zealand and also to California butter, and that nation has under consideration legislation similar to New Zealand's. When that goes into effect California dairymen must face a discount of two to four cents on their butter when in competition with butter from the South Pacific. This competition is keen in British Columbia and to a less extent in California and our own Northwest.

The slogan two years ago was: Pay the dairyman producing good cream a premium." But Sam Green now says: "Penalize the dairyman delivering poor cream." If the payment for cream is on a basis of butter market quotations it would seem somewhat easier to penalize than pay a premium. Penalize means pay less for the poor cream. Sam stated that California should find a good market for its surplus in Chicago and other eastern cities, for our production is greatest in the winter when the eastern production is least and their prices best. But we fail to take advantage of that market because we have so little butter of uniformly high grade, i. e., sufficient to make up carload lots on orders coming on short notice. Something must be done and some day something will be done, but probably not before our dairy interests are faced with more of a surplus production than now and an actual loss instead of profit to the producers. There is nothing like a sharp financial loss to bring producers in any line together.

Legislation

Mrs. A. G. Granpner came from the women's club circles of San Francisco with a cheering word. She had recently attended a milk conference in Berkeley, where various milk producing and consuming interests had sought to arrive at a mutual understanding. Both producer and consumer seem to have come to a common ground as to needed legislation and regulation. In fact that Berkeley conference must have been a real love feast where the lion and the lamb laid down together. One very promising feature is that little new legislation is really needed. There is enough on the statute books which if enforced will protect the consumer without injuring the finances of the producer. Mrs. Granpner, speaking for the mothers of San Francisco, laid down two requisites: (1) clean dairies; (2) general pasteurization. The first is now provided for in our laws. The second is common in San Francisco and Los Angeles, being practiced by all the large dealers, but it is a question whether the time is ripe for a law compelling it for all milk not certified.

One thing seemed evident, that the dairy interests do not want any bill introduced into the coming legislature like the two presented in 1913 and fathered by the state dairy association. It sought to repeal all former laws regulating milk production and inspection and introduce new and drastic methods. Some are so new and untried that both producer and consumer shy at them feeling that both may be worse off than before.

SANITATION

Poultry for Profit

THE FALL EGG PROBLEM

Written for California Cultivator by Jean A. Koethen

THE secret of success with poultry is very largely the secret of getting eggs when eggs are dear, that is, in the fall. Producing eggs in the spring when every hen is laying requires neither skill nor knowledge, nor does it go far toward paying the feed bills for the rest of the year. The fall egg is the ultimate end and aim of all poultry keeping, the center about which all plans and schemes revolve.

Every spring matings are planned with the design of somehow catching that will o' the wisp. Every fall hears the same complaint, "Hens won't lay. What is the matter?"

Instead of asking "Why won't they lay?" it might be well to ask, "Why should they lay?" The jungle fowl never thought of laying in the fall. It was enough for her to lay a couple of dozen eggs in the spring. This gave her as large a family as she wished to raise. Why should she worry about more?

It is a far cry from the jungle fowl of the dim and misty past to the domestic hen of the 20th century with her record of 300 eggs a year, and yet one little word bridges over the whole of the distance, just one word, "breeding." The 20th century hen lays from 200 to 300 eggs a year because she has been bred to lay. Feeding aand care have gone hand in hand with breeding, but they would have counted but little except for the selection, year after year, decade after decade, of the best fowls. Perhaps the selection has not always been very intelligent. Very likely it has been in many cases the survival of the fittest. Nevertheless, somehow or other the domesticated, laying hen, with her more or less high productivity, has been evolved out of that insignificant ancestor. What has been done can be done again, and it will be more effectively accomplished because of some things we understand now which were not understood even 20 years ago.

Fall laying, it must always be remembered, is contrary to nature. Spring is the natural mating season for birds and animals. Mother Nature herself is back of it all, and it is not easy to change the nature of things.

Egg-laying is reproduction, nothing more, and it is said that the pullets and cockerels which are most strongly sexed,—that is, that show their sex earliest, are the pullets which can most easily be induced to lay out of the natural reproductive season, and the cockerels which will transmit this quality from mother to granddaughter. The question is an intricate and interesting one and worthy of the most careful attention of scientists and breeders.

This much we know, however, that there are ways of increasing fall egg production and that the first of these is breeding for eggs. It is possible by selecting year after year the hens that as pullets laid well in the fall and the males that are known to be sons of high producers, and breeding from them, to produce a race of hens that will lay in the fall. This has been done in many cases. It is done systematically on all commercial egg farms. It will be done more and more by amateurs as the principle becomes more widely understood. Perhaps the time will come when all hens will lay in the fall as they now lay in the spring. Then there will be no more high prices for fall eggs, and we shall all be trying to change nature again.

Breeding for Eggs

In order then to have fall eggs it is necessary to select the pullets that lay in October, November and December. This is best done by means of the trapnest, but it may often be done, though without absolute certainty, by selection according to certain signs which are generally believed to be the marks of a layer, such as activity, red comb, blunt toe nails, width in the pelvic region, loud singing, especially the distance apart of her pelvic bones. This last is a very good test. When on examination the pelvic bones of a pullet are found to be stiff and close together, you may be very sure she is not laying and has never laid. When the bones are so far apart that you can put two fingers between them, and seem elastic as well, she has commenced to lay. When she is laying well you can easily put three fingers bteween the bones.

Now the only trouble with this method of selecting layers is that it speaks only for the present, except in case of a very young pullet. When you find a mature hen with pelvic bones stiff and so close together that not more than one finger will go between them, you know she is not laying, but you know nothing about what she has done. Several examinations are necessary before you can judge of a hen's performance in this way.

Band the cockerels that are known to be sons of these early layers. There must be no guesswork about this, and the best way to do it is to put these early layers by themselves, mate them to a cockerel that you know is the son of a high producer, if you can find such a one, and keep the cockerels from this mating by themselves. When they are old enough to mate the best one will be head of your cockerel pen, or perhaps you will find it wise to keep two or three for this purpose in case one becomes ill or dies.

ADVERTISED MERCHANDISE

It is pretty generally admitted that advertised goods as a rule are more satisfactory than goods that have not been advertised. It is natural that this should be true.

The man who advertises his merchandise, stamps his name or the name of his brand upon them, and then claims that particular brand possesses unusual merit. He is on trial, in a sense, because everyone can read what he claims and can give his merchandise a trial, and if it does not justify his claims, the world will soon know it. He must make good.

The man who does not advertise is under no such obligation, as he has made no claims. He simply permits you to take your chance on their quality. They may be good and they may not.

It is reasonable to believe that the man who is telling his story to the whole world will be very careful of what his factory turns out.

Feeding for Eggs

But the most carefully bred hen cannot lay unless she has material from which to manufacture eggs; making bricks without straw was not a whit more impossible. She must have protein and water for the egg, lime for its shell and fats and starches for maintaining the heat and energy of the body while she works. She must have green feed to keep the digestive apparatus in running order and working smoothly, and grit to assist in grinding her food. More than this, she must have a variety of each kind of food, lest her appetite fail and she be unable to eat a sufficient amount to keep the machine working. There is a variety of good mash mixtures, all balanced, and no end to the grain mixtures, but they must all be mixed, as the farmer said, "with brains."

A moist mash made of vegetables, meat and ground grains once a day is a splendid appetizer and a little bit of a stimulant to laying. Green cut bone, when it is fresh, is the very best of egg makers. This may be fed twice a week, all the hen will eat at once. There is nothing better for starting the pullets to laying, but it must be fresh. Sometimes scraps of fresh fish may be bought from the fish man. When these are boiled with waste vegetables and the broth is thickened with bran and shorts, you have a meal that is most tempting to any hen.

Sour milk or buttermilk is one of the best egg foods. It may be set out in pans for the hens to eat as they will, but is rather more satisfactory when used to moisten the mash. At the Missouri station, where such excellent records have been made in the egg-laying contests, the dry mash is kept always before the pullets, and the same mash moistened with sour milk is fed a little after noon, just what the hens will clean up in a few minutes.

Cleanliness

It goes without saying that in order to do their best pullets must be free from all insect pests and must be housed in clean, comfortable quarters. A pullet that is constantly worried by lice cannot do her best. A pullet that is compelled night after night to submit to the tortures inflicted by thousands of blood-sucking mites cannot be expected to lay. Clean up first of all before you breed or feed or even dream of getting eggs. This is fundamental.

Exercise

The digestion of the material required for maintaining and running this egg machine which we call a hen depends very largely upon the exercise she gets. The laying hen is the working hen. The hen that will not work must be made to work. The muscular strength of her egg-producing organs, the digestion of her food, to a large extent her health itself, depend upon exercise.

Throwing a large part of the grain in deep litter and making the hen scratch for it whether she wishes to scratch or not is the one satisfactory method of inducing a hen to exercise. The grain need not be buried so deep that she must scratch all day. Perhaps it is better to give her a little at night without requiring her to work, just to be sure that she has all she needs. It has been estimated that a hen needs to scratch for about one-third of her feed, but this is a rather sweeping rule. Much depends on the hen, but it is better to make a hen scratch more than is really necessary than to let her grow lazy. Labor vincit omnia, they told us when I went to school, and labor for the hen is just as fundamental as proper breeding or feeding or comfort and cleanliness. They are all spokes in the wheel that keeps the egg machine going, and when you have learned how to make your hens lay when other hens are not laying you have nearly mastered the whole science of poultry culture.

The General says:-

Be sure you're Certain-teed—then go ahead.
Roof every building on your farm—house, barn, silo, granary, machine shed—everything with

Certain-teed
ROOFING

This 15-year-guarantee label is on every roll or crate—and the three biggest roofing mills in the world back up the guarantee.

LILLY'S Soluble Sulphur Compound

The Perfected Sulphur Spray

From an analysis made by Dr. H. G. Byers of the University of Washington, the following conditions were found in Lilly's Soluble Sulphur—

Positively No Free Alkali
High Percentage of Polysulphide

The most valuable constituent of a Sulphur Spray.

It further showed that Soluble Sulphur is not a caustic soda preparation.

Write for circular and spray book containing spray instructions and spray calendar.

Krogh Pumps

It has taken us 35 years to be able to KNOW irrigation work so that we can offer you the "Krogh Service" of today. You are sure of satisfactory results as long as you own a Krogh Pump. For any depth of well. Let our "Field Engineers" advise you.

Krogh Mfg. Co.
San Francisco – Los Angeles.

QUESTIONS AND ANSWERS

(Continued from Page 415)

katydids hatch from these eggs. This is not the first time katydid eggs have started an inquiry and caused orchardists concern for fear it might be a new pest.

Intercrop of Grapes

Can Thompson's seedless grapes be grown successfully between peach trees? The trees are Elbertas and Muirs. The Elbertas are 24 feet apart and the Muirs 20. Trees are four and six years old. The soil is a sandy loam.—Subscriber, Laton.

We have seen vines and other crops planted between rows of peaches, and both gave good results. However this plan calls for extra care and water and fertilizer. The greatest trouble is that it takes nerve on the part of the orchardist to remove the vines in time to prevent injury to the trees. Peach trees at 20 and 24 feet apart, as they grow in California, use practically all the fertility in the soil, and if they have to divide up with grapes one or the other will suffer unless extra fertility is added. In the above we refer to trees in full bearing. If the vines had been planted at time of planting the orchard they would all be producing, and as the peach trees got older the vines could be removed, but if we were expecting to make the very best out of our peach orchard after it had arrived at the age of five or six years we do not believe we would plant vines as an intercrop. It is possible that some annual might be produced, one, two, or possibly three rows, for another year or two, and do no injury or even prove of value to the orchard if the fertility taken out by the crop is returned.

Sewage

I am desirous of installing a bathroom in my house on the ranch and would like to know the best way of disposing of the sewage. I have an eight-foot pit down to sand and water, well roofed with dirt so we plow right over it, into which the sink and stationary tubs empty, but do not like the idea of emptying anything else into it, although I know of instances where similar arrangements have been in use for a number of years and have given no trouble. However I prefer a better way if there is such.—Subscriber, Fresno.

If your pipe connecting the house with the eight-foot pool is trapped and has a vent so as to prevent escape of gas back into the house, and the pipe is large enough to carry waste from bathtub and toilet, with continuous fall all the way to the pool, there is no reason why the same pool should not be used for these purposes as well as for waste from sink and washtub. The writer at one time had a cesspool dug between eight and ten feet deep, into which an ordinary hogshead—one in which crockery had been shipped—was dropped to hold the sides from caving in. The top of this hogshead was practically two feet under the surface of the ground, then a shoulder was cut in the dirt all around the hogshead, 12 or more inches, and over the entire hogshead was a two-inch redwood plank cover. A vent was built to connect with this pool, the outlet running on a diagonal to the nearest orange tree, and the escape was up in the tree where there was no danger of injury from the cultivator. This was some distance from the house or it would have been safer to have had the vent much higher. The pipe connecting this pool with the house was vitrified clay pipe for some little distance from the house, but down through the orchard an ordinary redwood box built of three by four and four by four stuff was all that was used. Of course the fall was heavy, which gave rapid drainage. It would be safer where continual cultivation is necessary, instead of one covering of two-inch plank, to make one layer of two-inch and cross it with another, also of two-inch redwood. It should then last for years. Perhaps a better and safer way of securing a vent from the pool would be to follow the ordinary method of running a vent pipe even with the highest point of the roof, then with traps in the house there would be no danger of sewer gas. In case of solids filling such a pool, where the sides and top have been solid enough to permit of long life, a second pool may be built near it and a waste pipe connected one with the other. Where the pool is located in the orchard it is really beneficial, especially if the gravel subsoil is reached so that the ground surrounding does not become water-logged.

Roup—Chicken Pox

What is the cause and remedy for what is called the swell head in chickens? In old chickens the head seems to sweel, the eyes first and then the whole head. In young chickens the head seems to be covered with scabs. This disease seems to be among chickens all in and around this vicinity.—Subscriber, Visalia.

It looks as if your old hens had roup, but the young ones surely have chicken pox. For the old ones, try dipping the heads in a pail of water with a film of kerosene on top, a teaspoon of kerosene in a quart of water is ample. You can hold the heads under while you count 20 or 30, but be sure and don't hold them too long. If you prefer you can give them the permanganate of potash treatment, putting about a tablespoon of the permanganate in a quart of water and dipping the heads as directed above. Before you do this it is a good plan to press upward with the thumb and finger on the sides of the nostrils in order, if possible, to clean out the passages. A few drops of kerosene in the drinking water is sometimes a help. But treating roup is of no use unless you remove the cause. Are the birds sleeping in an unventilated house? Are they, perhaps, overcrowded? Maybe there are drafts through cracks or knotholes behind them when they are on the roosts. Perhaps there is dampness in the house from some cause or other. No use doctoring till you have found the cause and remedied it.

To treat the young chickens, first remove the scabs. You may prefer to soak them a little with warm soapy water first so that they will come off more easily. Then touch each sore lightly with a feather which has been dipped in creolin. Dr. Sanborn recommends calcium sulphide internally, one grain for each adult fowl, half as much for young chickens. Mix the drug in a little moist mash once a day. This is said to shorten the time of the disease and to keep the chickens that have not already taken it from getting it.—J. A. K.

NO MORE

Scoggins—Well, do you still belong to the High Thinking Cult?

Nutley—Naw! While I was busy repeating "health, wealth, success," the fellow just below me grabbed my job.

WALNUT TREES

Steady, staple Crops, and Profitable Returns.

MAYETTE — TRUE WILTZ STRAIN. For productiveness, FREEDOM FROM BLIGHT AND SUNBURN, and QUALITY OF NUT, the Wiltz Strain of Mayette has no equal in ANY of the other standard sorts. Late Bloomer.

FRANQUETTE — TRUE VROOMAN STRAIN. Late Bloomer. Second only to the Wiltz Mayette Walnut for Northern and Central California.

Our scions of Wiltz Mayette and Franquette are cut by R. Wiltz, pioneer walnut grower, and are not only absolutely true as to strain, but are cut from finest, selected parent trees.

When planting a Walnut, get THE BEST. Write us today.

ANSWERED PRAYER

At first I prayed for Light—
  Could I but see the way,
How gladly, swiftly would I walk
  To everlasting day!

And next I prayed for Strength—
  That I might tread the road
With firm, unfaltering feet, and win
  To heaven's serene abode.

And then I asked for Faith—
  Could I but trust my God,
I'd live enfolded in His peace
  Though foes were all abroad.

But now I pray for Love;
  Deep love to God and man;
A living love, that will not fail,
  However dark His plan.

And Light and Strength and Faith
  Are opening everywhere!
God only waited for me till
  I prayed the larger prayer.
        —Mrs. E. D. Cheney.

IN SPITE OF MAGIC

(Cooncluded from last week)

But the hour of midnight was to be the crucial test of future partners for life. Apple parings might fall into all sorts of angles that would be mistaken or construed into any desired letters, but a face in a mirror—surely each contenance bore its own distinction, and there could be nothing but plain magic in that test.

Cornelius grew hot and cold as the hour approached. He had scarcely a word with Mary Finn, so absorbed was she in her duties as hostess.

At ten minutes before midnight the girls withdrew to a bedroom, from whence issued much giggling and pushing about and sudden shrieks of laughter. Mrs. Finn ambled to and fro in friendly banter with the waiting young men in the parlor.

"No cheating, boys," she warned, her voice shrill above the vigorous singing of Mr. Christopher Brady at the piano. They laughed good naturedly and joined in the chorus of "She Said She Loved Me, But Now She Loves Another Fellow," and something in the air stuck in Cornelius' memory and could not be eradicated for many a day.

"I don't see where we fellows get any fun out of it all," growled Mr. Brady, whirling around on the stool. "I wonder if I couldn't let down my hair and run around with a hand mirrow—what do you think I'd see, eh?"

You'd see a conceited puppy!" joked Mr. Finn, slapping Mr. Brady's broad shoulders with easy familarity. "Let me whisper a secret, Chris—excuse me, gents"—he bent down and whispered in Mr. Brady's red ear, while that gentleman nodded mirthfully.

Sure, I'll do it. I'm on. I thought maybe there was something more! Have a cigar, Mr. Finn." He followed Mary's father into the kitchen, and Cornelius sat silently, alone, envying the easy manners of the big Mr. Brady and his apparent intimacy with the Finns. Did this friendliness portend some bond between Christopher Brady and Mary Finn?

Cornelius grew wretched as the time passed. Mary must soon make her test of fate in the gloomy hall. When would he know if it was his own face she had seen over her shoulder? Would she tell it to the assembled company or when his questioning glance sought hers? Desperately he calculated the chances that fate held for him, and he admitted they were very few indeed. Everything he had ever gained he had had to struggle for, as had his father before him. He had fought tooth and nail for his position as office boy in the beginning, and he had fought his way up to his position as shipping clerk by sheer force of will and pluck. In his practical experience he had never called upon luck or fortune or fate to aid him in his climb. He just planned what he wanted and then worked up to it. It had proven a good method in the past.

Now he wanted Mary Finn. If he won her it must be by his usual methods. He must not trust to chance nor to any other doubtful means. There was no time to fool with luck or the magic sorceries of Halloween. He must have Mary Finn in spite of magic, in spite of Christopher Brady, in spite of everything.

Then it was that a daring thought came to Cornelius Babcock—daring because he was unaccustomed to intrigue or fighting in the dark, and this game called for darkness. Leagued against him were Christopher Brady and his intimacy with the Finns,and also on the opposing side were the chances that Cornelius would not win. So he resolved to fight for what he wanted—for Mary Finn.

Mr. Finn entered the parlor and lifted a hand to the chandelier. "I'll be dousing the light, boys," he warned. "Everything's got to be dark as your hat. Out she goes!"

In the thick velvety blackness that followed, Cornelius stepped, swiftly as a cat, across the floor to the door that led into the corridor. It was ajar and he pushed it open, slid around it and entered the hall where he felt his way into the embrasure of another door and waited, his heart pounding heavily.

Mary Finn would soon come down the hall, her fair hair swinging loose, her sweet face peering in the mirror's depths for the face of her true love. And Cornelius would be there, looking over her shoulder, his eyes meeting hers in the candlelight—settling their futures at one blow.

A door opened, and with muffled shrieks a slender form came into view holding a lighted candle before her. It was Mary Finn!
advanced. She looked so much like an angel, with the mist of hair about her angel, with the midst of hair about her shoulders and her eyes fixed timidly on the glass, that he almost forgot the role he had selected to play.

As she approached his hiding place Cornelius braced himself to overcome the shyness that began to steal over him. Here was his opportunity to forestall the goddess of chance—he would win Mary Finn in spite of magic!

As she passed he leaned forward and peered over her shoulder just as a dark shock head leaned from the opposite doorway to perform the same service. Their heads bumped vigorously, were withdrawn and then met

in growling threats. Mary Finn turned with a frightened cry.

"Whatever is the matter? Why-y!" She stared at the two rivals with mirthful eyes.

"Did you see my face, Mary?" snapped Cornelius sharply, aware that he had suddenly attained manhood. "Didn't you see my face first?"

She flushed and nodded with downcast eyes. In the gloom her hand stole into Cornelius' outstretched palm.

"Ah-h-h," growled Mr. Christopher Brady sourly. "You saw my face in the glass too! How about me, eh?"

"Maybe you're going to be my second husband, Chris—if anything happens to Corny—but I hope nothing happens!"

And Mr. Brady had to be satisfied with that arrangement.—Ex.

IDEAS FOR THE COOK

Written for the California Cultivator
By Isabel Cottle

Breakfast

Cream of Wheat with Stewed Berries
Broiled Ham Banana Fritters
Coffee

Lunch or Supper

Sliced Roast Beef Tomato Cakes
Creamed Oyster Plant
Warm Gingerbread Tea

Dinner

Liver Rolls Delmonico Potatoes
Creamed Green Corn Chopped Pickle
Graham Rolls
Favorite Cake Coffee

Delmonico Potatoes

Melt ¼ pound grated cheese in 1¼ cups white sauce. Arrange diced, cold boiled potatoes and white sauce in alternating layers in buttered baking dish. Cover with buttered crumbs and bake until brown.

Liver Rolls

Dip thinly sliced calf's liver in boiling water, then in flour, and salt lightly. Place on each slice a spoonful of dressing made by crumbling fine one-half loaf stale bread, seasoned with salt, pepper, onion salt and sage. Moisten with a very little hot water (do not make soggy). Roll the slices of liver around the dressing and fasten with toothpicks. Brown on all sides, then place in pan in oven, add a little boiling water, cover and steam for 15 to 20 minutes, leaving off cover last five minutes.

Tomato Cakes

Take one cup of canned tomatoes, two eggs, one dozen soda crackers rolled fine. Season the tomatoes and mash with half the crackers, add the eggs and beat smooth; add the rest of the crackers and form into small cakes. Drop into a hot buttered griddle and fry a nice brown.

Favorite Cake

Cream one cup butter until soft with 1½ scant cups cane sugar and juice of half an orange. Beat until creamy, then add one-third cup cold water from the one cup used in cake. Next add one cup flour that has been sifted three times with two tablespoons cornstarch (do this with each cup). Beat in long strokes, then add a little water and the second cup of flour. Beat, then add the rest of the water and the third cup of flour with two heaping teaspoons baking powder. Beat again, and add well-beaten whites of four eggs. Bake in layers. Flavor with vanilla and orange.

Filling

Whip one cup of cream. Beat the whites of two eggs to a stiff froth. Beat one-half cup of powdered sugar and the yolks of the eggs together and flavor with half a teaspoon of vanilla. Put all together and add one cup of chopped blanched almonds, or stoned and chopped prunes, raisins, dates, or other fruits.

MAKING OLD THINGS NEW.

A little oil or varnish on the old furniture will work wonders. There are many prepared furniture polishes which are excellent. Combined with care and elbow grease they are unequalled for brightening the home. Neither is plain soap and water to be disregarded.

It is just plain foolishness to borrow trouble when it is so easy to make it.

THE STRENGTH OF THE STUBBORN

How much perfectly good, serviceable will-power people waste in mere obstinacy! Martha Malone, after working three years for Mrs. Bixby, appeared one morning at Mrs. Wilson's back door and applied for a place.

"Why," said the surprised Mrs. Wilson, "I thought you were working for Mrs. Bixby!'

"I was, mum. But I've quit."

"Is that so?" Mrs. Wilson could not conceal her surprise. "I thought you liked her."

"Indeed I do, mum."

"And I'm sure she liked you."

"I believe she did, mum. Leastwise she always seemed to."

"Well—" Mrs. Wilson was still wondering what the trouble had been.

"Well," said Martha, seeing that some explanation was expected, "you see it was like this, mum. I always put the blue china plates on the right-hand side of the cupboard, and this morning the missus comes along, and moves 'em, and says, 'Martha, every mornin' for three years you've put the plates on the wrong side, and I ve had to come along and move them—and I can't stand it any longer.'

"And," said Martha, "I says to her, 'Mrs. Bixby, every mornin' for three years I've put them plates in the right place, and you come along and moved them, and then I had to come along and move them back, and I can't stand it any longer either.'

"And so I quit."—Youth's Companion.

It is simple to minimize kitchen drudgery if one will go about it in the right way. It is not necessary to rub and scrape pots and pans until the arms ache and the hands are raw. A little five-cent hand scrub and plenty of salsoda, which can be bought for a cent a pound, will do the work. As soon as a meal is cooked and served, remove as much of the grease and food from the pans as possible with a knife, then fill them with hot water, put in a few lumps of the soda and let them boil or stand a while, when a light scrubbing with the little brush will remove all dirt and grime which has been softened with the soda. Then wipe them off with a clean, dry cloth and set them upon the stove to dry.

In the press of household cares, no matter how many temptations occur to neglect it, the proper setting and appointment of the table should never be overlooked. It ought to be a matter of pride with every housewife to see that her table is properly set and the food nicely served. If carelessness is once allowed to creep in and things begin to go at loose ends at the table, the family's table manners begin to deteriorate. When their table manners begin to go their other department will soon follow in the downward course. The table setting should be just as punctiliously correct for the family alone or even for one individual as for a royal banquet.

Tomatoes with the skin removed and hollowed out, then filled with minced fish or chicken and a little mayonnaise, make a delicious relish.

HOME MADE ACETYLENE
brings greatest of city conveniences to the country

The Chicago Gas Company has over 500,000 customers. Other big city gas companies have proportionately as many. These millions of city people wouldn't know how to get along without gas. They long ago found it so superior to oil and coal that they hardly know what these things look like.

City folks used to have this great convenience to themselves. But today HOME-MADE ACETYLENE is even a greater boon to country homes than city gas is to city homes.

Acetylene is ten times richer than city gas — the light is white, more brilliant, and far more beautiful. Acetylene is also like city gas, a perfect cooking fuel. With an acetylene range in her kitchen the country housewife can enjoy cooking in cool comfort without any of the drudgery of handling kindling, coal or ashes.

The light fixtures are, too, handsome brass or bronze—selected from a catalogue of many styles.

The men folks on the place can have big white lights of their own in barns and outbuildings — and have all fixed to light with the pull of a chain — without matches.

A quarter of a million farmers now make this light and fuel right at home. Each one fills his acetylene generator once a month with the acetylene producing stone, UNION CARBIDE. The generator does all the rest.

The new models are inexpensive and are wonderful improvements over the early types.

We will be glad to answer questions and mail our very interesting advertising literature. Write to

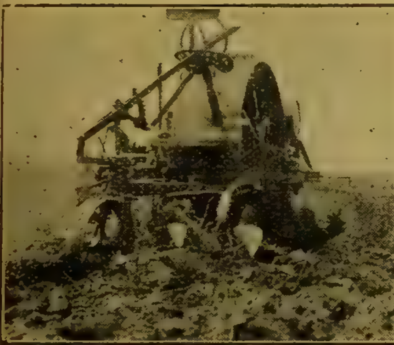
read what The
STEEL KING
Motor Plow
will do for You—



In Your
Plowing
use a gang of four 10-inch moldboards for grain crops. If you like discs, use a gang of three 26-inch discs. You will do better work with the discs under ordinary conditions.
In Your
Harrowing and Cultivating
use a 6-foot or 8-foot tool and travel at high speed.
In Your
Mowing
we will show you how to make a hitch of three mowers, cutting at high speed, at a cost of 10 cents per ton.
In Your
Sub-soiling
it sometimes is better to use a special 16-inch moldboard instead of the regular sub-soilers.
In Your
Stationary Work
figure on a positive 18-horsepower plant, which you can hook up to in a minute.
In Your
Various Other Problems
perhaps our experience may be of service to you. We have worked and are working under many different conditions of soil and topography.
In Your
Steep Hill Side Work
the STEEL KING will surprise you. It sticks like a goat.
Cost about $1.00 per Day
3500 POUNDS
$1050.00

Bulbs
For fall and winter planting; also Flower Seeds for fall sowing. New Catalogue now ready, mailed free upon application.
NOW IS THE TIME TO SOW
Payne's Royal Exhibition Pansy Seed, the best strain on the Pacific Coast, Giant Perfection Stocks and Payne's Christmas Flowering Sweet Peas, all described in the above mentioned Catalogue.
THEODORE PAYNE
245 S. Main St. Los Angeles, Cal.

Citrus Fruit Market

LOS ANGELES, Oct. 28, 1914.

Everything is lovely on the orange market. Last week has seen on the whole the highest prices of the year. Valencias are being cleaned up very fast. Five hundred cars were sold the beginning of this week and only about 200 remain to be sold. The first Floridas sold on the market last week at $1.80, in comparison with $3.25 for Valencias. This is a pretty good indication that the market is not in need of green oranges. Tulare County shippers advise that they are finding fruit in the earlier orchards that will meet the test and shipments will begin about the 10th of November on Navels. This will be too late for the Thanksgiving market in the far eastern sections, but will catch the Thanksgiving trade in the middle west.

The lemon market is about the same, 300's are finding good sale, but 360's and second grades are slow.

Shipments

Shipments of oranges from Southern California to date since November 1, 1914, 38,797; lemons, 2900, total, 41,697. To same date, last season 13,562, lemons 2183, total 15,745. To same date, two years ago, oranges 30,224, lemons 5938, total, 36,162. Shipments of oranges from Tulare County to date, 5876 cars; from Butte County, 404 cars.

Answers in this column by Dr. Wm Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Screw Worms

I would like to know what kind of a fly is responsible for the screw worm. Please describe it as fully as possible. The worm seems to get into nearly all fresh wounds on the farm stock and sometimes in the old wounds. No one in the neighborhood seems to know what the fly is like.—Subscriber, Exeter.

To get rid of the screw worms apply iodoform to the wound and cover it with collodion. This may have to be repeated several times. Then dust the parts with air slaked lime to heal them.

(The screwworm fly, chrysomyia macellaria Fab,. is a bright metallic green with three or four black stripes on the upper part of the thorax, and about one-third of an inch long. It deposits its eggs in sores and wounds and in nostrils and ears of cattle. It lays 300 or 400 eggs in a few moments. In a few hours the larvae develop. The larvae are white maggots without legs.—Editor.)

Bleeding Warts

I have a young mare troubled with warts. The raw, tumorous kind which scab over, then break and bleed. The largest is about three inches long and two inches in diameter and surrounded by many small ones. Would a string tied tightly around the larger ones cause them to drop off, or would a caustic take them off?—Subscriber, Ethanac.

Various treatments are followed in dealing with such abnormal growths; each with greater or less success, according to the thoroughness with which they are applied. Strangulating them with a cord as you suggest is all right if the cord is placed at the very base of the wart and made tighter from time to time until the wart drops off. Then the sore may be treated like any ordinary wound. For the small ones apply nitric acid. That will kill the wart and it will drop off in a day or two. Be careful in using the acid and do not allow it to touch your hands or clothing, as it is a very strong caustic.

Thrush

My horse has lost the frogs in her front feet and the new frogs continue to slough off. They have a very offensive odor and are very soft. What is the best remedy?—Subscriber, Sanger.

Probably it is thrush. Remove the shoes and pare the loose parts away. Then soak well with turpentine, being sure to get the turpentine well down into the cracks. A few applications will stop the trouble, and then in time a healthy frog will grow again.

Snag

On bringing colt in from pasture after being in the hills for eight months, I find he has running sore on inside of right hock joint, just below the hard substance that grows inside all horse's legs. The opening is about the size of a small pea and the discharge is very light and of a bloody nature. The joint is not much swollen and seems to give no pain, as the colt does not mind having it handled and is not at all lame. Please advise treatment—Subscriber, Ontario.

Probably a small snag or thorn has been forced through the skin, and broken off, leaving a portion inside. You will have to explore the wound to the bottom with a probe and remove any foreign substance that may be found. After that it will only be necessary to keep it clean.

Conjunctivitis

Some of my cow's eyes run water and the eye turns white. The parts around the eye get pink. It does not affect their appetite. Is it pink-eye? If so what can I do for it?—Subscriber, Kerman.

The front of the eye is covered with a skin or membrane that is called the conjunctiva. It is very thin and perfectly transparent. Inflammation of this membrane causes it to become thickened and turn white. The disease is called conjunctivitis. It may be caused by a blow from a whip lash, from dust or from the small burrs that surround some seeds. There is a form of conjunctivitis that is caused by a microbe and is contagious. In either case the following treatment should bring good results: Sponge the eye well with warm water and then dry it by pressing a clean towel against it. This can all be done with the eye closed. Then press the lids back with the fingers and apply with a camel's hair brush to the membrane a solution made of ten grains of nitrate of silver to the ounce of water. Repeat this once a day until the eye is partly cleared. The animal should be kept in the dark, as the light causes pain and retards recovery. Or if it is necessary to turn out for feed then tie a thick cloth to the horns or the halter, so it will cover the affected eye and keep the light out of it.

Summer Sore

I have a valuable horse that has a growth on the ankle. When it first came it looked like a small wart. Now it is as large as a hen's egg. It looks like a chunk of raw meat and bleeds very easily. I have tried a number of treatments, among them was burnt alum, and nothing seems to affect it. Can you tell me what to use to remove it?—Subscriber, Gridley.

It is probably what is commonly called a summer sore, caused by a very small parasite getting ino the tissue of the skin and causing so much irritation that the horse will gnaw and rub it and cause it to bleed. It is difficult to heal. Such sores usually get well without treatment when winter comes, but often return the next summer. Clip the hair very close all around the sore and apply vaseline to the skin. Then soak a pledget of cotton, the size of the sore, with formaldehyde (full strength) and bind it loosely on the sore. Keep it on for half an hour, if you can, and then cover the parts with collodion. When the scab comes off dust the parts with air-slacked lime. If the parasites are all killed the sore will heal quickly; if not repeat the treatment.

Beautify Your Home
USE WALL BOARD
When Building Your New Bungalow and Garage or Remodeling Your Home.
BEAVER BOARD
is ideal for the production of beautiful panel effects, and makes old and unsightly walls durable and artistic.
It does not crack or damage like plaster, and is easily applied.
SCHUMACHER WALL BOARD
Made in Los Angeles
It is cheap as lath and plaster and a perfect substitute. Can be finished in any manner desired — paneled, tinted, papered or sand painted.
A fire resister and sound deadener.

Bean Power Sprayers

"The Bean Is The Best"

You want a sprayer that will throw the mixture on at the necessary high pressure—a sprayer that will stand the wear and tear of hard service in the field—a sprayer that will last—a sprayer that is easy to operate and does not require constant repairing and adjustment. Then get a "BEAN." Made in five sizes—all very reasonably priced.

Send for Catalog 28-A—Just Issued

It illustrates and describes the entire BEAN line of Hand and Power Sprayers and Pump Accessories, and explains the 21 Distinctive Bean Features; Porcelain-lined Cylinders, Rustless Ball Valves, Underneath Suction, Steel Frames, Pressure Regulator, Bean Patented Cut-off, etc., the result of 27 years' experience.
Get Catalogue 28-B for Centrifugal Pumps; 28-C for Opposed Gas Engines.

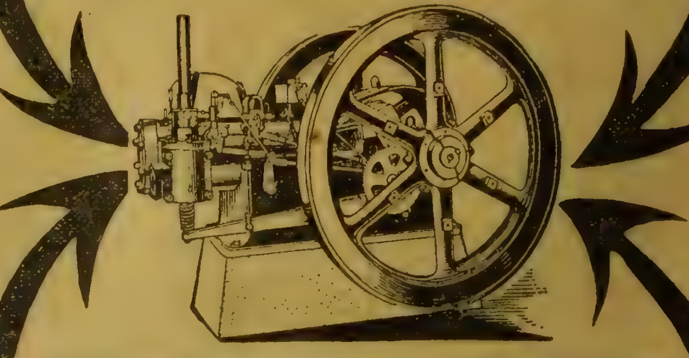
WESTERN GAS ENGINES

There's trouble enough on the ranch without engine trouble. You don't want an engine you have to tinker with all the time. You can get an engine at most any price—as low as you want to pay—but when you get a cheap engine your troubles have just begun.

Western Gas engines are built to run without trouble. Very quiet and steady—perfect balance—no jerky, wobbly, explosive hit-and-miss running.



WESTERN GAS ENGINES

are economical of fuel—consuming special gas oil at 2¾c per gallon; they cost ⅓ of a cent per horsepower per hour to operate.

Before buying an engine send for our catalogue—free to all who write for a copy.

New Land
Completely Equipped
Clean Seed and Trees

Forty Acre Special

NOW is the time to start farming.

The High Cost of food supplies assures good profits.

Farm Labor is at a Premium and your living expenses will be at a minimum.

THIS IS YOUR OPPORTUNITY to own a farm, newly and completely equipped.

NEW LAND capable of big crops.

NEW AND MODERN EQUIPMENT reduces labor costs.

Work under the direction of a Farm Adviser to avoid errors. Services Free.

This offer should demand the investigation of any one desiring to start farming, or wishing to move into a new district, where there will be a big future.

Your money cannot be placed in a safer way than in new land being improved.

NOW is the time to plow and prepare for the spring planting, and assure yourself of a full crop next year.

Utilize every acre and have no waste.

THE PRICE is $150.00 per acre—first payment one-fourth of purchase price, balance to be arranged.

This Price Includes:

40 ACRES—Good level land—San Joaquin Loam—in the Sacramento Valley near the foothills, in the true thermal belt.

PUMPING PLANT—Well and direct-connected motor and centrifugal pump—completely equipped and installed.

TREES—Your selection of almonds, apricots, prunes, peaches, figs, and others. Olives, oranges, lemons and walnuts for planting along roadways. We furnish the best nursery stock obtainable.

SEED—Corn, beans, milo, alfalfa, grain, etc.

FARM IMPLEMENTS—A plow, a harrow and a cultivator.

This equipment is the best obtainable, produced by well known manufacturers. The trees and seed will be furnished by the most reliable firms on the Pacific Coast.

Watch for Their Names
Each One Stands for Quality

Send this paper to any friend whom you think may be interested in such an opportunity. We will send a three months' subscription to The California Cultivator, without charge, to any one in the East who is interested in owning a California farm.

Write for further particulars of this inviting opportunity to establish yourself on a profitable and fully equipped farm.

Nurserymen's Convention at San Diego

Some Serious Business, More of Good Times, and a General Get-Together Which Will Prove Advantageous to the Nursery Industry

SAN DIEGO is in California, consequently within the boundaries of the U. S. But it has many quaint nooks all the way from Point Loma or even La Jolla around to Tia Juana, and in addition has such a foreign way of working the tourist that one may readily imagine himself in a foreign land.

Speaking of Point Loma, its wonderful view of sea and mountain ranges, and its peculiar religious institutions which help in giving a foreign impression, make it a spot long to be remembered.

But one spot on "the point" which is the shrine of nature lovers is the home of Alfred D. Robinson, editor of the California Garden.

Mr. Robinson not only edits California Garden but he makes one, and it's worth a pilgrimage to view it.

He grows many things, but dahlias he grows to perfection. Not content with growing from the tubers produced by others he has hybridized and has grown seedlings which I have not sufficient adjectives to describe.

One in particular, "Star of the East," is a magnificent large white. That one flower is worthy a life's effort. In addition to his other duties Mr. Robinson is president of the floral association, which is a factor in the beautifying of home grounds and even highways and byways of San Diego.

The San Diego Floral Association did itself proud in the matter of entertaining the California Association of Nurserymen. In the first place the hall was magnificently decorated, combining excellent taste with a showing of plants and flowers which was educational in itself. Not content with one banquet they gave two. One was called a luncheon and was served in one of San Diego's most beautiful parks. The more formal banquet was given on the last evening of the convention at Hotel Grant and, as usual, the principal feature was a number of short addresses made by various members of the association. John Morley, park superintendent of San Diego, presided and retiring President Coolidge and incoming President Howard both made witty speeches.

A pleasing event on the last day of the convention was a visit to the grounds of the Panama-California Exposition, and this was a surprise, even for those who have visited it within the last few months. San Diego will certainly put up a great exposition. Its grounds traversed by ravines and hillsides have afforded opportunity for wonderful landscaping, and no exposition was ever given which afforded a more beautiful site than does the Panama-California at San Diego. Nearly all of the buildings are completed and doors are barred except in some cases where exhibits are being installed. The horticultural building is especially beautiful, with a wonderful showing of rare plants.

The names of the new officers of the association were given on editorial page of the Cultivator of October 22.

The committee on resolutions returned the usual expression of heartiest thanks to the people of San Diego for their reception, also commending the administration of the state commissioner of horticulture and urging more uniform horticultural laws. The United States department of agriculture was commended for its magnificent work in the matter of plant quarantine. A resolution was passed sustaining the state viticultural board for its attitude in protecting the vineyard interests of the state.

For the greater part of the story of the convention we refer our readers to the little photographs appearing in this issue. They tell the story better than it can be told in any other way.

W. B. Ames, San Dimas; E. Bernard, San Diego; T. D. Robertson, Fullerton; John Vallance and John Morley, Judging Committee on Exhibits in hall.

Wilson Popenoe of the U. S. Department of Agriculture, E. D. Sturtevant, water lily grower, Hollywood; Mr. Thiene, Peter Bisset, U. S. D. A., and T. U. Barber of West India Plant Introduction Gardens.

John S. Armstrong, H. W. Kruckeberg, being photographed after dark.

Frank T. Swett of Martinez, and Mr. Briggs, of the Sacramento Bee.

R. M. Teague at left, Frank Wilson of Fresno, center, and John Vallance of the C. C. Morse Seed Company.

Ernest Braunton, Theodore Payne and former President D. W. Coolige.

Gill and Pettingell. At the reader's left, J. W. Pettingell of Santa Barbara and E. Gill of Berkeley.

George C. Roeding talking to the new president, Fred Howard, regarding next year's campaign.

Miss Kate O. Sessions gathering a fund of information from Mr. Peter Bissett of the U. S. D. A.

John Morley at the reader's left, Superintendent of Parks, San Diego, and R. M. Roberts, Agriculturist for the Santa Fe.

At the reader's left and somewhat in the background, Mr. J. F. W. de Jong. Center and nearest the foreground, W. V. Eberle of California Nursery Company; at his left, R. M. Teague of San Dimas Nurseries.

Fred Rafferty, Jacob Dieterich and Edwin Lonsdale, Manager Floradale Seed Farms, Santa Barbara.

J. H. Smith and Paul G. Thiene, Superintendent Department of Horticulture, Panama-California Exposition.

Organize State Association

California's Greatest Industry Has No Regular Organization Looking After Its Larger Interests. The Matter Will Be Discussed at the State Convention Thursday Afternoon

IN nearly all states where fruit growing forms one of the principal industries, there are regularly organized associations with a permanent membership, and the duties of these associations, or of their directors, is to watch over the larger interests of the industry. It may be these interests have to do with legislative matters, nomenclature of fruits, more successful methods of work, or, in some instances, with the merchandising side. Usually, however marketing and allied questions are

Vetches

produce humus and nitrog en in the soil — the two big essentials in groves and orchards. From our studies of the needs of the citrus belt this year, we are strongly recommending the following:
FENUGREEK: is a rank and rapid grower, producing successfully on poor soils.
MELILOTUS INDICA and **BURR CLOVER** are also adapted to heavy and poor soils as they produce a deep and heavy root system resulting in the breaking up and in the porosity of the soil.
VETCHES: We are headquarters for imported and Oregon vetch.
We cannot too strongly advocate the inoculation of seed for best results. Hundreds of our patrons testify that the use of

FARMOGERM

300%
Crops

has increased their crops from 200 to 300%, thus giving more humus for the soil and more nitrogen -- gathered from the air by the nitrogen gathering bacteria and deposited in the soil through the nodules they form. The cost—less than $2.00 per acre. For booklet on *Farmogerm*, advice on Cover Crops and Prices, write to Dept. C

Important Notice *to those attending* ***THE FRUIT GROWERS CONVENTION***

The attention of the delegates and members who will attend the State Fruit Growers' Convention to be held in Los Angeles on November 9th to 14th, is called to the fact that the Hotel Northern has been selected as one of the headquarters, and in consideration of this the Management has made a very special rate for all delegates and their friends attending the Convention, which gives them the opportunity of obtaining a first-class room without attached bath for $1.00 per day, or a room with connecting bath for $1.50 per day; no extra charge, at either rate, for two persons occupying same room. These prices cover all rooms in the hotel, some usually renting as high as $5.00 per day.

The above special rates are made by the Management of the Hotel Northern to the members of the State Fruit Growers' Association and their friends in order to get this new, modern, fireproof hotel known to the fruit growers of the state. Send them a postal card and room will be reserved for you.

Citrus and Tropical Fruits

WHY NOT EDUCATE THE RETAILER OF CITRUS FRUITS?

Written for California Cultivator
By J Eliot Coit

A few mornings ago while walking along a business street in Berkeley I paused before a fruit display in the front of a grocery store. A boy was engaged in taking lemons from the box, unwrapping them, and arranging them in a large pyramid-shaped pile. Just as he was placing the last lemon on top the footing course gave way and the pile slid down, a few dozen rolling around on the freshly sanded floor. I did not remain to listen to his remarks but as I walked away the incident set me to thinking.

In the first place, I knew that probably 90 per cent of those lemons were now infected with blue mold and would show decay in three or four days. I also realized that the lemons would likely be sold before the decay became apparent. The woman who buys a dozen lemons from that pile will doubtless expect them to last her a week. She will be disappointed and disgusted.

A few weeks ago a peddler called at my door with a load of oranges. The fruit was piled up in the bed of the cart. As the fruit was apparently sound and the price low I purchased four dozen. At the end of three days all the remaining oranges with the exception of three were decayed with blue mond.

The average housekeeper does not understand the relation between careless handling and decay, and after a few such experiences concludes that citrus fruits will not keep and limits her purchases accordingly. The average grocer also is apt to take too high a percentage of decay for granted and fix his prices high enough to cover much unnecessary loss. All this causes a certain amount of dissatisfaction with citrus fruits, and when the instances above mentioned are multiplied by thousands in order to include the groceries and peddlers' carts all over the country it becomes evident that the result can be none other than a restriction of consumption.

But this is not the time for citrus growers to acquiesce in any restriction of consumption. With production increasing at a rapid rate no economical means of increasing consumption should be neglected. The interest of the fruit grower does not cease with the acceptance of his fruit by the trade. His prosperity depends to a large extent upon the satisfaction, enjoyment, and enthusiasm with which the ultimate consumer uses his fruit.

Much is being done by advertising to educate the consumer in regard to the dietetic value and eupeptic qualities of citrus fruits. Such advertisements might be allowed to include the suggestion that it is more economical to select fruit from the original package than from the display window.

Some years ago Mr. G. Harold Powell carried on a campaign of education among the growers and packers in regard to the value of careful handling. So much good was accomplished that all became interested, and at present careful handling is appreciated and practiced by the average grower. Is it not worth while to preach this same doctrine to the retailer?

Perhaps it would be practicable to place in each packed box a neatly printed card calling attention to the necessity of handling the fruit carefully. Two pictures at the top might serve to catch the eye and be made to represent sound oranges carefully handled and mouldy oranges resulting from dropping the fruit on the floor. Several well planned paragraphs below the pictures would give facts and figures to clinch the idea in the minds of those sufficiently interested to read.

However, it is not my intention to say by what means the retailer is to be educated, but to point out the facts that the ignorance of the retailer is now resulting in much rotten fruit which causes him to increase his margin. Poor keeping fruit and high prices dampen the ardor of the consumer, whereas it will require enthusiastic consumers to take 50,000 cars of fruit a year at satisfactory prices.

MARKETING ORANGES

Written for California Cultivator
By H. E. Collins

The general business depression extending all over the United States and Canada has had its bad influence on the wholesale orange market as well as on other lines, but has the orange merchant, the retailer, made provisions to meet changed conditions? In a general way, no. It is true he buys his goods cheaper this year from the producer than before, but does he sell proportionately cheaper? In most cases, No. A short time ago Valencias were selling in San Francisco at 50 cents per dozen. This means on a box of 150 size (12½ dozen) $6.25 per box. These goods had cost $1.65 f. o. b. or $2.00 delivered per box, or not quite 16 cents per dozen. 300 per cent divided between the jobber and the retailer.

In Chicago, Montreal and Detroit, Valencias were selling for 75 cents and 60 cents per dozen on August 8, last. These goods had cost delivered about $2.75 per box of 12½-15 dozen. Allow they were all 150 size, 12½ dozen per box (the average dozen in a box is nearer 15 than 12½) this means a box that cost $2.75 was sold for $9.37½, the difference divided between jobber and retailer; and my observation led me to believe that in most cases the jobber being the better business man was working on a fair margin and that the retailer was actually limiting consumption by asking prices that put the fruit out of the reach of the many.

The higher the price to the consumer, the slower the sales. Cheaper the retailer buys, does less business and still makes money. But how about the

San Dimas, Cal. U.S.A.

grower, suppose he could get five cents more per dozen or about 60 cents per box more on a normal crop of say 15,000,000 boxes—$9,000,000 velvet for California. Is this not worth looking into, and everyone using all his brains and energy to bring about a different condition?

When we find a way to give persons of moderate means oranges (and they want them) at popular prices, 100,000 carloads will be needed in the United States and Canadian markets.

The retailer is entitled to a profit; the jobber is entitled to a profit; but the growers or manufacturers of the goods should have something to say if the present methods pursued by the distributing trade are unsatisfactory and profitless. Let any one reading this article write to friends in the East and get the price of oranges by the dozen, then figuring the average dozen per box at 15, look at his returns per box at that date, and I guarantee he will do some thinking right away and will do something else later. Put yourself in the other fellow's place. How many oranges would you buy at 60 cents per dozen or $9.00 per box for a family, say, of four?

In order to increase consumption you must reach the majority of the people. The minority have the most money individually, the majority the least individually, but most collectively. Therefore in order to get volume cater to the majority. The fruit can be sold at such a lower price per dozen that the majority can buy and show a good profit to all.

How many $4000 automobiles do you see compared with $1000 machines or less? Read the hand-writing on the wall, think and act.

The solution of this condition may not be worked out at the first effort, and many will say it cannot be done. But it can be done. It has been done in other lines, and very successfully too. Furthermore there is money in it for all concerned because the mass of the people want our goods at a price they can afford to pay, and that price would show a good profit to all concerned. But the retail price must be governed by the wholesale cost. Under present conditions practically it is not.

I saw oranges in Los Angeles stores at 40 cents per dozen or $5 to $6 per box last week. This fruit could be purchased for $1.90 per box or 12⅔ cents per dozen, delivered in Los Angeles wholesale. Now the difference between cost and selling is too great, that is, to freely move the fruit and put it in the hands of the multitude. I saw 150 boxes of grape fruit (pick boxes) sold in Redlands in one day by one store two weeks ago at 50 cents per box. Now, mind you, this was in Redlands, where many people can get grape fruit from their friends for the asking. But until this live merchant sold it by the box for 50 cents it had been mostly wilting in the stores at 40 cents to 50 cents per dozen or rotting on the ground three blocks from the main street. It is only an example of what can be done with popular-priced fruit by a merchant who figures on the volume of sales.

Under our modern methods in California oranges can be grown and sold to the consuming public at a price whereby they are no longer a luxury for the extremely rich and very well to do, but can be used freely by people of moderate means, the great consuming class who now by the short-sighted policy of the present distributors are prohibited from a healthful and pleasant fruit to the detriment of the California growers.

CITRUS FRUIT ESTIMATES

The estimates for Florida run from 8,500,000 to 9,000,000 boxes of fruit; not much increase in oranges, but about a 50 per cent increase in grapefruit over last year.

California is looking for a somewhat lighter crop than a year ago, about 40,000 cars, which, roughly figured, would mean about 16,000,000 boxes of oranges and lemons, grapefruit cutting no figure in the California shipments. Of this amount there will probably be something like 8,000 cars of lemons.

Other citrus sections of this country cut very little figure. Oranges are raised in Texas, Louisiana, Mississippi and Alabama. The Louisiana crop will run close to 300,000 boxes, but the output from other states is hardly worth considering at this time.

The crop on the Isle of Pines, almost wholly grapefruit, has been increasing rapidly, and must be considered as a factor even now, though in years to come it will be such as to make the growers there serious competitors of Florida pomelo men. This year they expect to ship 150,000 boxes; this fruit going by steamer direct to New York and being sold wholly in that city.

Porto Rico shipped to New York last season 229,000 boxes of oranges and 167,000 boxes of grapefruit. The growers are claiming that they will have a 50 per cent crop increase this season.

ORGANIZE STATE ASSOCIATION

(Continued from Page 435)

left to special organizations. California has had no such organization looking after the more general interests of fruit growing or agriculture. Fruit growers have met in annual or semiannual sessions and committees have been appointed which have had annual existence, one in particular—that of transportation—having lived for years and accomplished much good. But at the same time the looseness of this "organization" has been such that it has been somewhat embarassing. A "delegate" was any attendant, no matter what his calling, and we recall a few years ago one of the largest conventions ever held in the state, at which fruit growers were in minority. It was at a time when Russ Stevens, as chairman of the committee on transportation, did not receive the support which his committee is receiving today, and his report was absolutely turned down. Possibly it was wise, but in any case it was proof that the interests of the fruit growers were not uppermost in the minds of the loudest voters in the convention.

In view of the greatness of the fruit growing interests of this state is it not wise that at the fruit growers' convention, which will convene in Los Angeles next week, a part of one afternoon should be given over to discussing these matters and getting the organization on a firm basis?

In the past the state horticultural commission has been able to give full reports of the proceedings of conventions in book form but at the last three sessions this has not been possible because of use of moneys at the command of the commission for policing and quarantining the state. The proceedings of the Los Angeles meeting will probably appear in book form through the good will of firms who have articles to sell to fruit growers. Reports received from nearly a dozen associations in other states show that not a single one of them was compelled to resort to advertising in order to issue a state report. Should the greatest fruit state in the Union make such a showing?

Although no regular place on the program has been set aside for discussion of the organization of an association, it appears that on Thursday afternoon there will be an opportunity for a short discussion.

In order to get an expression from some of the fruit growers of the state the Cultivator has asked a number as to the wisdom of such action. From replies received we quote:

State Commissioner A. J. Cook

While Dr. Cook has not written anything directly for publication, the matter of the formation of such an organization was talked over in committee meeting, at which Dr. Cook was present. It appealed to him, as to all others, that there was opportunity for great good to be accomplished in the formation of such an association. It is anticipated that the organization will affiliate with the state horticultural commission, the force of the experiment station and agricultural college and, in fact, use every force which will advance fruit interests.

W. A. Johnstone.

The idea of forming an organization of fruit growers to carry on the work of the state fruit growers conventions throughout the year is most excellent. There are many reasons why such an association should prove useful and beneficial to the industry. Lack of organization is indeed the one great weakness of all agriculturists. Considering the magnitude and importance of this industry and that California's fruit production alone aggregates over $100,000,000, it is astonishing that we are so far behind in state organization. In its representation in the legislature, there are a mere handful of men in each house who are practically or primarily connected with agriculture as a business. Because of this, our interests lack the consideration to which they are fairly entitled. Much has been done and is being done, but much more must still be done. In order to accomplish these things we must have organizations and through them the combined support of the whole industry. The creation of a state agricultural department, unifying all of our commissions and boards under the leadership of one able and

Ground Limestone for Agricultural Purposes

Nearly all lime used, no matter in what form, is prepared directly, or indirectly, from deposits of Calcium carbonate, chief of which is Limerock, from which our Ground Limestone is made.

We quote as follows from the Kentucky Agricultural Exp. Station, Bulletin No. 84, under heading "Lime for Agricultural Purposes."

"Fresh burnt lime and hydrated lime may give better results the first year than ground limestone, but this is because of its caustic effects on the organic matter of the soil, causing a more rapid giving up of nitrogen. Experiments in Maryland and Pennsylvania show that used through a long period of time, the raw ground limestone gives the better results."

Our Ground Limestone is made from the highest quality limerock obtainable, and is ground to the proper degree of fineness recommended by the University of California.

You can get prompt deliveries from us either in bulk or sacked. Write us for further information, prices, terms, etc.

Healdsburg, Calif.

well qualified man is an example of what needs to be done. We have now a number of small and unimportant boards, bureaus and commissions competing between themselves for appropriations, with of course very unsatisfactory results. The plan of forming an organization of fruit growers is excellent and I trust will be carried out.

Thos. F. Hunt

Dr. Hunt writes that in order to judge absolutely one would need to know of past experience and that there should be good reason for such a move, and adds: "I think, however, that the matter should be thoroughly discussed at the coming meeting at Los Angeles."

C. C. Teague

It would seem to me that it would be desirable to have a permanent fruit growers' organization to handle matters of state-wide interest to fruit growers which may come up from time to time between the regular state conventions, and to promote interest in these conventions.

F. B. McKevitt

I believe that the idea expressed in your editorial (California Cultivator, July 16) is decidedly a meritorious one, and some plan should be devised to work up an organization of horticulturists of this state on practical lines.

E. E. Luther

In reference to the horticultural society will state that I thought the Fruit Growers' Convention was stronger than any horticultural society in any other state that I know of. It might, however, be wise to incorporate this body. It might be stronger that way. However, in days gone past, it has been quite a strong organization. There is one point you must remember, that very few people desire to belong to a society of dues wherein they do not see immediate direct results. When this convention is held in different parts of the state local people, for that year, take a decided interest in it but after that little or no interest. It might be well to have a society distinct and separate from the State Fruit Growers' Convention, but I do not believe it would be the best policy to change the Fruit Growers' Convention into a "dues" society. I believe you well know the conditions which confront the organization of the same.

W. S. Guilford

The organization of such an association will be a wise move.

R. S. Vaile

When the suggestion was first made R. S. Vaile, secretary of the state association of County Horticultural Commissioners, wrote to each member of that association, and from his letter we quote:

"It has been suggested by the committee on arrangements for the 45th State Fruit Growers' Convention that there would be many advantages in organizing the agriculturists of the state in attendance at such convention into a more definite association, with regular officers, membership, fees, etc. The plan has been adopted in several other states and the association is of value in carrying out details connected with state-wide horticultural work. They also have a fund at hand from fees that may be used for the publication of reports, etc. It is thought by a great many that the reports of these conventions are of prime importance, but owing to the shortage of funds in the state commissioner's office their publication seems problematical. If such publication could be arranged through such an association that alone might well justify its existence. There are other points also, such as the "Eight-Hour law," which might be far better handled through a definite organization than through our present loose system."

LOUDEN BARN PLANS

Every reader of the Cultivator who has any idea of building a barn will receive some good ideas by studying Louden Barn Plans, published by the Louden Machinery Company, Fairfield, Iowa. It has a price mark of one dollar and is well worth it. We imagine any large buyer of Louden appliances, which are most excellent, might get a liberal publisher's discount. In any case write the company for information regarding the book and working plans and specifications which may be had complete for from five to ten dollars.

SAVE MONEY on Irrigation Pipe

"AMERICAN" Surface Irrigation Pipe is the most economical pipe to buy. It is made of HEAVIER GALVANIZED SHEET STEEL than any other pipe, and is sold CHEAPER IN PROPORTION to quality and workmanship than any other pipe. It has NO RIVETS to pull out, but is made with the DOUBLE-LOCKED, TURNED AND SOLDERED SEAM, which is the strongest made, and CANNOT LEAK, even though the pipe be SMASHED FLAT. "AMERICAN" pipe will outlast any other and is by far the most ECONOMICAL to buy. Don't buy any irrigation pipe without getting our catalog, which explains fully the GREAT SUPERIORITY of "AMERICAN" Pipe. Remember, also, the service of our IRRIGATION ENGINEERS is FREE.

GROW INOCULATED LEGUMES

Alfalfa, Clover, Vetch, Field Peas and Beans

Inoculate Forage, Cover and Green Manure Crops with

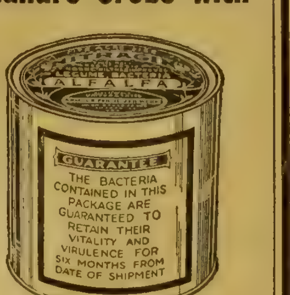
The Improved German Soil Inoculator, Nobbe-Hiltner Process

NITRAGIN

TRADE MARK REG'D DEC. 6, 1898 NO. 32212

PURE CULTURE

THE SIMPLEST SAFEST AND SUREST SYSTEM OF SOIL INOCULATION FOR ALL LEGUMES



ALFALFA
GUARANTEE
THE BACTERIA CONTAINED IN THIS PACKAGE ARE GUARANTEED TO RETAIN THEIR VITALITY AND VIRULENCE FOR SIX MONTHS FROM DATE OF SHIPMENT

"NITRAGIN" is the wonderful germ that unites with the legume root and draws from the air the precious *nitrogen*—necessary to *all* plant life, health and growth.

Failure to get a stand or a perfect "catch" is nearly always due to the absence or weakness of the nitrogen-gathering germ. "NITRAGIN" Pure Culture gives to your legumes *billions* of these active, vigorous germs; as a result the plants grow quickly and luxuriantly; they are big, strong, healthy, deep-rooted.

A legume inoculated with "NITRAGIN" Pure Culture is the best *shade or cover crop* because of the quick growth, vigor and luxuriance of plant, and because it is a *soil-enricher* instead of a *soil-robber*. It is the best green manure crop because of the immense quantity of new nitrogen it adds to the soil and the extra richness of the humus.

"NITRAGIN" Pure Culture is the *original*—discovered by Nobbe and Hiltner, famous German bacteriologists; it has been improved and perfected by twenty years of testing and proving. It comes to you in *granular* form, packed in ventilated tin cans. Easy to apply—ten minutes work—a boy can do it.

Alfalfa—You can't afford to risk failure on this wonder crop. For Alfalfa success, inoculate the seed with "NITRAGIN."

"NITRAGIN" invariably insures a perfect "catch," quick growth, enormous yield and extra food value.

Inoculate *all* legumes with "NITRAGIN" Pure Culture. A special strain for each legume—27 varieties.

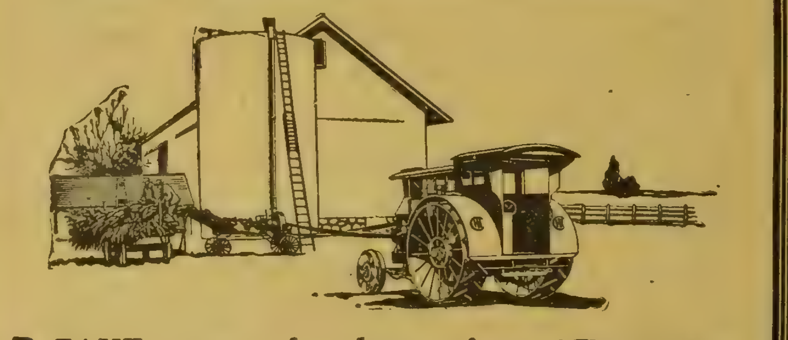
Pure Culture inoculation is endorsed by Government authorities, state experiment stations, practical farmers, agricultural experts and soil culturists. Let us send you testimonials and other *proof*.

Price: Garden size $1.00 per can; acre size $2 per can; 5-acre size $9 per can. F. O. B. Postage and express extra. Parcel Post, 10c per acre extra. Ask your seedsman or fertilizer dealer for "NITRAGIN."

Prepared in the Laboratories of the German-American "NITRAGIN" Company, Milwaukee, Wis.

Guaranteed and Distributed by **Armour Fertilizer Works** Los Angeles, California

International Harvester Tractors Solve Farm Power Troubles



MAKE a note of a dozen of your hardest and most troublesome farm operations and you will find that International Harvester oil tractors—Mogul or Titan—can be used with profit in all.

They furnish reliable power for all belt machines and for disking, plowing and other drawbar work. Features which make I H C tractors valuable are the truck design, the large mainshaft and its long bearings, the power starting system, the dust-proof engine—features of proved value which you find on all International Harvester tractors.

I H C tractors, Mogul or Titan, are simple, strong, and easily operated. They are built in all sizes, 6-12 to 30-60 H. P., and in styles to meet the needs of every farm. Be sure to see especially, the lightweight 12-25 Mogul, built for the small farm. This machine, equipped with our new self-steering device is a marvel of labor saving.

Write us for catalogues and other information about I H C tractors and engines.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Employer's Liability

I hire a man to chop wood for me by contract, and he does his work by contract, paying no daily wages. If one of the choppers is injured would I be responsible under the employer's liability act?—Subscriber, Alta Loma.

Under the employer's liability act the term employe is defined as every person in the service of an employer under contract of hrre or apprenticeship, it excluding any person whose employment is not in the usual course of the business or occupation of his employer, and also excluding any employe engaged in farm, dairy, agricultural, viticultural and horticultural labor, in stock or poultry raising or any household or domestic service. Under the above definition it would be very clear that you would not be responsible in the above case.

Collecting for Pasture

A man left three animals on pasture with me five months ago and has paid nothing on the bill. I have written to the address he left, but letter has been returned unopened, and I can find no trace of him. What proceedings must I take to collect my bill? Must I advertise animals before selling them to cover pasture bill?—Subscriber, El Centro.

You have a lien upon the animals under Section 3050 of the Penal Code. If the value of the pasture is under $300 you may bring suit in the justice's court and have the animals sold to satisfy the amount due you for their pasturage, together with costs of the proceedings.

Settling Estate in Iowa

What is the law in Iowa in the settling of an estate where no will was made, where all the heirs are of age. Do the heirs have to begin settlement in a certain time? If so, what is the limit? Can one heir have an administrator appointed against the wishes of the rest of the heirs? Has the court power to appoint any one without the consent of the rest of the heirs? Can he administer on moneys of the estate and leave a farm to be disposed of by some one else, or should he go through with the whole affair? Also what per cent are administrators allowed for attending to it?—Subscriber, Fullerton.

The law of Iowa is somewhat out of the sphere of this column, but as the laws of all the states are very similar to that of California in respect to the questions here involved, the answers are made under the California law. The law fixes no time within which a petition for letters of administration is required to be filed. Administration must be granted only to residents of the state and in the following order and relationship; surviving husband or wife, or some competent person whom she or he may request; the children, father or mother, brothers, sisters, grandchildren, next of kin, public administrator, creditors, any person who may be competent. The court has power to appoint any person petitioning, being otherwise qualified, without the consent of others. All property belonging to the decedent must be administered, and the administrator would be liable upon his bond if some of the property of the estate was disposed of by some one else. The compensation of the administrator is as follows: On the first $1000, 7 per cent; on the next $9000, 4 per cent; on the next $10,000, 3 per cent, and so on.

Contract to Buy Water

A has signed contract to buy water from B for two years. Before contract expires A sells property to C, who does not want water. Does sale release A from holding contract? If not, of whom can B demand the fulfillment of contract? Can he take a lien on the property? Would such a contract be an incumbrance on property? Is a right of way an incumbrance?—Subscriber, Pond.

Whether your contract is or is not one which could be considered a covenant running with the land, depends entirely upon the terms of the contract. To entitle you to a lien upon the property your contract should fall within the following definition: "A covenant made by the owner of land with the owner of other land to do or refrain from doing some act on his own land, which is expressed to be for the benefit of the land of the covenantee, and which is made by the covenantor expressly for his assigns or to the assignes of the covenantee runs with both of such parcels of land." If your contract does not fall within the above definition, you may nevertheless hold the party agreeing to buy water for the profits to be derived from the sale of water to him.

Road Right of Way

A.'s and B.'s land join. A road passes through both places and also across one end of C.'s. A. and C. want a road cut to eliminate all gates, but B. will not consent. The supervisor says that the expense would not be justified by the travel of same. What can A. and C. do to get a road out? The road in question had been traveled for nearly 30 years with from three to five gates to open and shut, but these have never been locked. B. has threatened to lock gates and close road. Can he or not?—Subscriber.

The fact that gates had been placed across the road would tend to show that any use of it by the public for a way was only permissive and a strong evidence and support of a mere license of the public to pass over the designated way. It is essential in order to establish a public way that there be a dedication thereof. A dedication exists only when the owner of the land has manifested some intention to make the dedication, and where the dedication of a highway is sought to be that such use was with the knowledge of the owner or with consent or without objection upon his part. The question of the remedy at law to enforce your right of way depends somewhat upon the original conditions of acquisition, and title to the respective properties. If the road has not been dedicated, either by written act or by sufficient use, the gates may be locked. If it has ben so dedicated, you are entitled to the free use of the road. The question rests so much in evidence that it is impossible to give a more definite answe rthan the above.

Payments on Contract

A friend and I each bought five acres of land under contract. My friend could not make the payments, so to protect him I informed the man from whom we bought the land that I had bought the contract from my friend and would make the payments on same. Contract is still under my friend's name. Agreement to pay was only verbal to the land holder. Now I can't make the payments for both contracts, due Nov. 1, myself. Could I compel owner of land to apply the payments, principal and interest, which I made on my friend's contract, to my contract of five acres?—Subscriber.

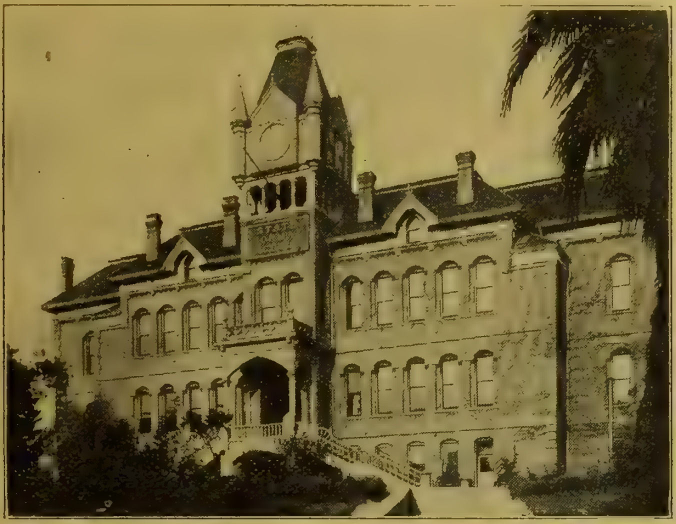
You cannot compel the owner of the property to apply the payments which you have made upon your friend's contract to your own. Your only right, if you have any at all, is to require your friend to repay to you the money advanced for his benefit. The land holder cannot force you to pay further upon your friend's contract as your agreement to pay thereon was verbal and contrary to the statute of frauds.

State Fruit Growers Convention

Exhibition Planned Which Will be Almost Equal to That of an Agricultural Fair. Plans Made for Greatest Fruit Growers Convention Ever Held in the State.

AN exhibit almost equal to the State fair will be a drawing card at the State Convention. Some 5000 or 6000 square feet of exhibit space is already engaged, and some of it filled.

The exact location is the former State Normal building at Grand Avenue and Fifth Street, Los Angeles. Every attendent is urged to go first to the Hotel Clark, Hill Street between Fourth and Fifth Streets, and register as an attendant at the Convention.



STATE NORMAL BUILDING
Fifth street and Grand avenue, Los Angeles, where sessions of 45th State Fruit Growers' Convention will be held.

LOBBY OF HOTEL CLARK
Headquarters for delegates at state convention. Information bureau located near door.

A feature which it is hoped will be instructive is being worked out—if it will fit in with the rest of the program. This will be a trip to the state exposition building located in Exposition Park near the University of Southern California. The state has a great property in this, which was formerly the sixth district fair grounds. One building costing a quarter of a million is being filled with exhibits and is well worth the visit.

A big banner at the head of Fifth Street locates the convention. One cannot miss it.

The Woman's Department af the State Fruit Growers' Convention will prove most attractive and should greatly increase the attendance by Mrs. Orchardist accompanying Mr. Orchardist to Los Angeles for a bit of an outing. Home economics, methods of simplifying home work and opportunities for women in horticulture, will all be discussed.

Two practical farm women who won many most commendatory notices because of their addresses at the last state fruit growers' convention, Mrs. Nielson of Sebastopol and Mrs. Roberts of Grass Valley, are coming from the north end of the state to address the convention. Mrs. Nielson will speak of her work of jelly making and looking up a market to handle her product. She has made a success as has Mrs. Roberts. The latter secured her market in the Hawaiian Islands. These addresses alone should bring out many farm women of California.

Railroad rates are always interesting. In this case fare and a third will prevail and to secure advantage of it every purchaser of a ticket on a steam road should buy his ticket one way and insist on having a receipt, which, when validated at the convention, will entitle him to return fare of one-third.

The Lawn and Flower Garden

THIS MONTH IN SOUTHERN CALIFORNIA

Written for the California Cultivator
By O. M. Morris

BULBS are the principal item of interest just now. All the winter and spring flowering varieties should be planted as soon as possible. Contrary to expectation, the European war has not affected the bulb market to any extent and all varieties and classes have arrived without delay.

Probably the most popular of the Dutch bulbs is the daffodil which thrives perfectly in most situations, blooming satisfactorily under all sorts of conditions. The Spanish iris is a close second, being easily grown and a splendid cut flower. These come in white and all shades of yellow and blue. They should be planted this month for February and March flowering.

Hyacinths and tulips require a little more care than some of the other bulbs but, if planted under proper conditions, give blooms which are very acceptable for table decoration.

All the annuals may be planted this month. Many of the seedsmen have prepared for their customers a wild garden mixture for broadcasting in vacant spaces to take the place of weeds and rubbish heaps. If possible these plots should be plowed or spaded up to get rid of as many of the weeds as possible, then broadcast the seed and rake in, or it may be sown in pots or borders as a mixed wild garden for winter and early spring flowers.

Large plantings of poppies are being made in most all districts to make the country attractive to the tourists who visit this section during the winter months. Poppies will reach the blooming stage in about three or four months. It is advisable to plant as soon as convenient, first thoroughly wetting the ground and working it up a few inches, then sow the seed broadcast and rake in. The seed will start quickly and be well along for the early winter.

For a supply of winter cut flowers, centaurias, scabiosa, pansies, stocks, calendulas, calliopsis, candytuft, gaillardia, gypsophila, mignonette and schizanthus are indispensable. They require from three to four months to come into bloom and should be planted at once. For bedding plants pansies, daisies, pinks and linum, or scarlet flax, should be planted, and strong plants of campanula and digitalis should be set out in permanent borders if not already out.

One of the newest pinks is the sweet william, or the early flowering annual variety. This blooms in about three and one-half months, the heads are larger and the flowers more full than the old type of sweet william and their early blooming makes them particularly fine for cut flowers. Being perfectly hardy they are an important acquisition to the list of winter bloomers. This plant is a hybrid between the barbatus and plumarius pink, having its general appearance like the sweet william and the individual flowers being an average in size between the two parents, giving a larger flower than the sweet william, with the characteristics of the other parent. It should be planted by everyone wishing early flowers.

CULTURE OF LAVENDER

Lavender likes a light open soil, even when sandy or stony, and free sunlight. The plant is usually propagated from cuttings of one season's growth, cut with a heel, and planted in spring or fall. These are set three to four inches apart in rather moist soil and shaded until they root. Division of the plant is also practiced, but commercial growers think plants thus obtained are less robust and more susceptible to disease.

In commercial culture the young plants are set out in rows running north and south, six feet apart, the plants four feet apart in the rows. Clean cultivation is given. The plants are clipped to prevent flowering the first year, after which they bloom till five or six years old. Lavender is not heavily fertilized, but a light dressing of stable manure or wood ashes may be applied in the fall. Lavender is said to do well commercially planted in California. The world's lavender crop is chiefly produced by England and France.

MADERA COUNTY FARM BUREAU

Farm Adviser T. C. Mayhew writes: "My schedule of visits for November is as follows:

Chowchilla, November 2, 3, 4, meeting November 2; Madera, November 6, 9, 10, meeting November 7; Dixie Land, November 11, 12, 13, meeting November 11; Fairmead, November 16, 17, 18, meeting November 16; Oakhurst, November 20, 21, meeting November 21; Nipinnawasee, November 23, 24, meeting November 24; Coarse Gold, November 25, 26, meeting November 25; Northfork, November 27, 28, meeting November 27.

An all-day meeting of the valley centers of the farm bureau will be held at Fairmead November 7. Prof. J. I. Thompson of the university farm will speak on the pork industry. Mr. R. M. Roberts, agricultural demonstrator for the Santa Fe Railway Company, will speak on fruits. At this meeting the subject of incorporating the farm bureau as a buying and selling association will be taken up.

A like meeting of the mountain centers, Oakhurst, Nipinnawasee, Coarse Gold and North Fork, will be held at Oakhurst, November 21. Prof. B. H. Crocheron, state leader, will speak on the work of the farm bureau. Mr. R. H. Taylor, assistant pomologist, university farm, Davis, will speak on apple culture.

Holland Bulbs

Our Bulbs have arrived—all of them—better, larger, finer Bulbs than ever delivered before.

Our New Bulb Catalog

is now ready, describing all the latest novelties. The war has caused Holland bulb producers to send to us all those choice bulbs which were heretofore sold only in Europe.

Now is the time to plant bulbs—send for the book today; it also describes beautiful Pansies.

SWEET PEAS

Write for our Sweet Pea Catalog too, it tells how to prepare your garden, raise the finest blossoms—and shows by word and picture all about the newest varieties.

Small Fruits Vegetables

THIS MONTH IN THE SACRAMENTO VALLEY

Written for the California Cultivator
By S. S. Rogers

IN a recent issue of the California Cultivator the subject of growing winter onions in the Sacramento Valley was mentioned, and directions were given for planting the seed and growing the young plants up to the time they were large enough to set into the field. From the middle of November to the middle of December the plants raised from seed planted during September and October should be transplanted into the field. At this time they should have grown to about the size of a lead pencil, which is the best size for transplanting. Before setting the young plants in the field the soil should be thoroughly worked, turning under all the weed growth, having the surface soil in a fine mulch and free from clods. The moisture should be such that the soil is moist to the surface. There are several methods for transplanting the young onions into the field. Two of the most common ones are here given.

Where horse cultivation is to be used, the onions may be set in rows two and one-half or three feet apart, but where the cultivation is to be done with hand implements, the rows should be about one foot apart. Many of the growers plant the onions in sunken beds, which aids greatly in irrigation. Whichever method is pursued, the care and planting of the crop is the same.

Transplanting the Young Plants Into the Field

A few hours before the young onions are to be removed from the beds the soil should be thoroughly wet, which aids in preserving the young roots when the plants are being removed. Many of the growers make a practice of pulling the plants by grasping the stems, although it has been found that a much better method is by digging the plants with a hoe or shovel, preserving many of the smaller roots which would be destroyed if the plants were hand-pulled.

After removing from the seed bed the tops and roots should be pruned so that the plants are about five inches tall. They should be planted as soon as possible into the field, setting them shallow in the soil. Under ordinary conditions they should not be planted over one-half an inch deep. If the plants are set too deep the bulbs will not form upon the surface as they should, which makes them ill-shaped. If they are not set deep enough there will be difficulty in getting the plants started. In a few days after they have been transplanted and have commenced to grow, the soil should be thoroughly cultivated, not allowing the weeds to start or the ground to pack too much around the plants at any time throughout the season. The exact number of cultivations and hand-hoeings which the field will need, depends wholly on local conditions. When the majority of the tops begin to dry the crop is ready for harvesting, and this operation will be discussed in a future issue.

The above method for the production of onions is carried on when only a small amount of land is devoted to this crop. Where many acres are used for the production of onions, the seed is generally sown directly into the field during the winter or early spring. The future cultivation of onions grown from seed is exactly the same as when the young plants are transplanted. If the land is free from weeds the seed may be sown during December, but if there are many weeds sowing should be deferred until the weeds have become well started, plowed under and rotted. This generally means during January or February.

The planting calendar for this month is the same as for the month of October.

THIS MONTH IN SOUTHERN CALIFORNIA

Written for the California Cultivator
By O. M. Morris

Planting operations for November are practically the same as those for October, though with the more tender plants such as beans we should make only small plantings, providing the location is somewhat protected and on high ground. These should, however, be put in at once. The early bush varieties require about two months to reach proper condition for table use. Most of the other vegetables, such as beets, carrots, Brussels sprouts, endive, cabbage and cauliflower, lettuce, leeks, onions, parsnips and parsley, peas, spinach and turnips are perfectly hardy and can be planted with absolute safety in almost every district of the southern part of the state.

Peppers and tomatoes are now being planted in protected beds for early planting but it requires considerable care to keep these growing during the colder months and it is only practicable to grow them under cover, potting up or boxing off during the colder months for early planting out. Tomatoes, especially, cannot be grown well in flats and should be potted if started at this time. They will then make thrifty plants by the time frost is over. Peppers, however, can be handled very well in flats or boxes but should not be planted too thickly as they require plenty of room to make strong stocky plants. These should be ready to set out by the last of February.

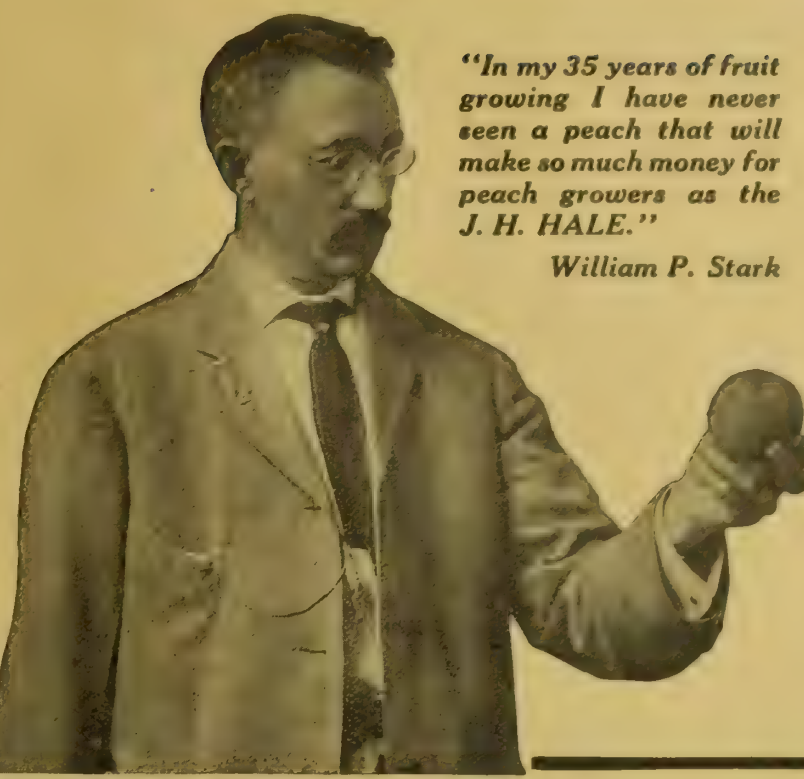
Those who have had trouble in growing spinach during the heat of summer should not forget that this is the season for the best development of this vegetable, as it thrives perfectly during the colder months.

The chayote is now coming in in considerable quantity. If one wishes to plant these select good ripe fruits and put in soil, a five-inch pot would be preferable, laying the fruit in lengthwise with seed end slightly elevated, covering about one-half or three-fourths over. The pot should be placed in a warm situation under a shed or in some place where it will not get the winter rains. A little water once in a while is all that will be required until well established, and then more water may be given. Too much watering before growth starts and too early planting in the open ground will result in failure. The fruit is the seed and if too much water is given it will destroy all prospects of growth.

Endive as a salad plant is not fully appreciated in this country. It is used extensively by the Europeans and its spicy flavor is a delectable addition to a salad.

Garlic has been an exceptionally profitable crop this year, bringing wholesale from $15 to $20 per hundred pounds. In fact, there has not been enough grown locally to supply our market and large quantities have been shipped in from Texas and the South. For early spring crop plant during the next month or two. For best development it should be planted only on loamy or sandy soil.

Winter radishes or the large white and black late developing varieties, such as Machado or Mammoth California White Winter should be planted. These grow to large size, weighing a pound or more, and require from two to three months for development, twice or three times longer than the earlier varieties.



"In my 35 years of fruit growing I have never seen a peach that will make so much money for peach growers as the J. H. HALE."
William P. Stark

The J. H. HALE Peach 53 Days After Picking

Identical Specimen Kept by Mr. William P. Stark in an Ordinary Ice-Box for Fifty-Three Days

Here in the record-breaking J. H. HALE is the peach Western growers have long been seeking. Not alone for its gigantic size (one-third to one-half larger than Elberta), but for its amazing keeping and shipping qualities. A peach so firm and solid it can almost be shipped like apples in barrels. A peach that carries immense distances and such an exceptional keeper that it gives the retailer more time to dispose of his stock, which means less wastage and more profit to both grower and dealer. Send for catalog *today!*

No Peach Before With *All* These Features

Immense size like small cannon ball
Round, globular shape
Golden yellow flesh, carmine outside
Perfect freestone—meat of a cling
Ideal canner—holds shape—doesn't rag
Ripens 5 to 7 days ahead of Elberta
Smooth skin—*practically fuzzless*
Large size, costs less to handle
Heavy, dense flesh for drying
Late bloomer—avoid spring frosts
Fills crates faster, bigger profits
Ripens early—hangs late—long season
Brings 25% to 50% higher prices

In the J. H. HALE you have a peach of better quality than the Lovell or Crawford, a far better shipper than any known freestone, of better flavor for canning than Lemon Cling, and heavy and sweet for drying. Peach growers who have seen the J. H. HALE fruiting in Mr. Hale's orchards say: "Largest and most beautiful peach I ever saw." "More profit in the J. H. HALE trees if they cost $5.00 each than other varieties for nothing." "We can't grow other peaches and compete with this in the markets."

Shrewd fruit-growers are jumping at this opportunity. Thousands of J. H HALE trees were planted in California last year. Our supply of trees is limited. Every mail is crowded with orders. Reserve your trees NOW. Take the *early* profits!

Obtainable *Only* From William P. Stark Nurseries

Mr. Hale has appointed us exclusive distributors of this wonderful peach. All trees are propagated from buds cut from his bearing orchards. Be on your guard against irresponsible persons offering worthless varieties as the J. H. Hale. To get genuine J. H. HALE peach trees address *Wm. P. Stark Nurseries, Stark City, Mo.*

Special June-Budded Trees

In addition to our regular 2-4 ft., 4-5 ft. and 5-6 ft. J. H. Hale trees we have exceptional June-budded trees, preferred by commercial orchardists. These are strong, well-developed, well-rooted trees, with 1 yr. top and 1 yr. root. Write for prices.

No Agents—Save 30% to 50%

We sell only from our catalog. Save agent's commissions. Get our low prices on apple, peach, pear, plum, cherry, quince, apricot, grapes, bush-fruits, roses, shrubs, etc.

We Ship Direct to Pacific Coast

Safe delivery guaranteed to all California and Western points. Our trees pass all requirements of inspection laws. Customers say: "Trees received in better shape than I can get stock here." "Fine stock and in excellent condition." "Thanks for generous treatment and fine large trees." Write for 120 page catalog.

Look For This Tag

We attach this tag bearing Mr. Hale's signature to all J. H. Hale peach trees. It is your guarantee of *genuine* J. H. Hale trees. Refuse trees without signature.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

EAT CALIFORNIA SUGAR

Americans send $100,000,000 abroad to buy sugar. To pay for this requires the product of 7,100,000 acres of wheat, and less acreage than that would produce all the sugar America needs. It is unfortunate that the sugar industry has been discouraged as it was by tariff action, but perhaps the restriction of European production may overcome any adverse tariff and the country be given a great impetus. In any case we can help it along by eating our own California made sugar.

CONSOLIDATE

At the recent International Irrigation Congress held in Calgary a resolution was passed endorsing the amalgamation of the International Dry Farming Congress and the International Irrigation Congress. Of course if taken literally, these two great organizations are working along diametrically different lines, but in reality they come so close together in many points that it certainly would be wise to center their energies in one great gathering. Perhaps the greatest work of either of these organizations should be along legislative lines and there should be no conflict between them in this matter. Strength should be added by such a movement.

FALL IRRIGATION

Too many of our orchardists have an idea that once the fruit is gathered from the trees there is no further need for application of water until the approach of another fruiting season. This is true with garden or annual crops, but a fruit tree needs satisfactory environment the year through. Even when perfectly dormant in midwinter a tree requires some moisture in the soil and if deprived of that moisture its tissues will suffer. But especially at this period of the year is there need of moisture in the soil to allow the fruit buds which are forming for next year's crop to secure sufficient nutriment to give all possible vigor. The soaking irrigation given early in the summer may not be necessary or even advisable, but sufficient to keep the trees in a healthy condition is given by every fruit grower who anticipates a heavy crop next year.

SAVE THE WASTES

The potato is one of the favorite productions of the Germans and has been one of the most profitable, though in recent years the increase in yield has become so great that over 16,000,000 tons go for cattle feeding. With a production totalling 40,000,000 tons, waste and loss was liable to occur, but to correct the matter potato drying factories have been established, the output of which has increased three and a half times within the past five years. One and a half million tons produced 400,000 tons of dried materials. These dried potatoes have been shipped the world around. We are glad to note that experts of the United States department of agriculture and others are studying this question of wastes in California. Thousands of tons of fine fruits go to the dump every year because of lack of attention. Let us study every possible means for using up these wastes.

STATE CONVENTION

The committee of arrangements has practically completed its work of preparing for the great convention which will be held in Los Angeles next week. The assembly room has 1004 chairs, besides capacity for many others as found necessary. Best of all, the committee has arranged for an exhibit of orchard appliances, and the grounds surrounding the Normal building and several thousand square feet of space inside the building will be given over to exhibits of orchard products and orchard implements. There will be several tractors as a part of the outside exhibits. No prizes are given and no charge whatever is made for space to the exhibitors. The exhibit is merely educational and intended to bring together the orchardist and those who would serve him. We do not believe a better opportunity was ever offered to the fruit grower to gather a great fund of information during a short time than during the six days of the week beginning November 9.

SETTLERS SHOULD KNOW

Settlers and homeseekers in any new country should know vastly more than they usually do of the conditions they are to meet, which are so different from those in the section their farming experience was secured. Of course as a general proposition, that statement applies to all of us as well, but there have been so many glowing advertisements of producing conditions in California that the prospective settler has learned to look with too hopeful eyes and jump too quickly at conclusions, taking up a line of work for which he or the soil or the climatic conditions are not fitted.

To correct this, the University of California, or, more particularly, Dr. Thos. Forsyth Hunt, has issued Circular Number 121, "Some Things the Prospective Settler Should Know." Many of the facts here given are those presented to the State Fruit Growers' Convention held in June, and now gathered together in this book of 60 pages. Its usefulness is not confined to the prospective settler, for there are many points brought up in this book which are educational, even to the native Californian. Dr. Hunt has looked at conditions which confront the farmer and has presented his facts in a way that will cause all to use the pencil and do the business man's stunt of figuring a little on overhead expense and some other which is sure to come with every farming operation.

This publication may be had by any Californian who will write Agricultural Experiment Station, Berkeley.

HORTICULTURAL ASSEMBLY

About a year ago Dr. Herbert J. Webber, in charge of the citrus experiment station, called a gathering of fruit growers at Riverside and announced it as the First Annual Horticultural Assembly of the citrus experiment station of the University of California. Naturally plans were begun for the second annual which should occur this year at about this time or early in December, but conflicting with this was the 45th State Fruit Growers' Convention which, for the first time in many years, was scheduled to be held at its fall session in Southern California. To avoid duplication of conventions Dr. Webber merged the Horticultural Assembly with the State Fruit Growers' Convention and, instead of being held on the grounds of the citrus experiment station at Riverside, it will be held in the old state normal building on the corner of Fifth Street and Grand Avenue, Los Angeles, next week. Of course there has been material enlargement of the plans of the first assembly, and with the addresses which will be made by the staff of the experiment station and members of the force of the department of agriculture and the University of California, there will be an exhibition of many products and appliances connected with orcharding. The principal feature of this exhibit will probably consist of by-products of the citrus. There will be much that will be educational in this exhibit, and every Californian who possibly can should attend and give time to the study of this exhibit and hear the discussions.

Agricultural Notes

During the month of September motor vehicle registrations were received for this state at the rate of 138 per day.

The National Dairy Show is on in Chicago. It will continue all the rest of the month. There is a large attendance from all over the country.

The world's record for the output of sugar for any one factory is held by Chaparra in Cuba, which has brought its 1913-14 crop to a close with a production of slightly above 611,000 bags, or 87,300 long tons of sugar.

For six years the government has been battling with the tick problem of the South and the states affected have cooperated so well that the quarantined area is gradually being lessened and cattle raisers are putting in their pockets profits which formerly went to fatten ticks.

In England the local authorities are empowered to inspect herds of dairy cows and may order the slaughter of any animal that shows evidence of tuberculosis or even of any diseased condition of the udder. Compensation is given on a sliding scale, the amount granted varying with degree of infection as determined by post-mortem examination.

The Security Trust and Savings Bank has more than 88,000 depositors.

Think of it—as many depositors now as Los Angeles had inhabitants in 1890!

It shows how the public appreciates the great strength and superior service of the oldest and largest savings bank in the Southwest.

Stock Raising in Florida

Florida's greatest resource is her live stock. You can raise, fatten and market stock at BAY VIEW at a fraction of what it will cost you here in the North. Equally as good for dairying. Ready markets and good prices. Grass for pasture the year round. Don't have to stable and dry feed six months in the year.

Soil is deep, rich, sandy loam—very exceptional for Florida. Sample of this soil mailed free with literature. Plenty of rainfall 12 months in the year. Irrigation is unheard of. Crop failures practically unknown. Two and three crops easily raised each year on the same ground. $50 to $500 profit per acre each year. Satsuma oranges, figs, pears, peaches, plums, grapes and all kinds of berries produce abundantly. You can also raise enormous crops of corn, oats, hay, Japanese cane, clover, sweet and Irish potatoes, sugar cane, celery, tomatoes, lettuce, cabbage, watermelons, cantaloupes, egg plant, cucumbers, radishes, turnips and all kinds of early profitable vegetables. One of the finest climates in the United States, both summer and winter. No sunstrokes in summer—no frostbites in winter. Ideal salt water boating, bathing and fishing. Lumber at wholesale prices. Good stores, churches and schools. WRITE TODAY FOR FREE BOOK, SAMPLE OF SOIL, MAPS, ETC.

Santa Rosa Plantation Company
Room 355—208 N. 5th Ave., Chicago, Ill.

Agricultural News Notes of the Pacific Coast

Northern California

Glenn County is entering upon a farm bureau campaign. Many members have already been secured.

County Horticultural Commissioner Stabler of Sutter County is waging determined war on Russian thistle.

The supervisors of Nevada County have passed a drastic ordnance against the shipping into that county of infected trees or plants.

County Horticultural Commissioner Lyons of Lake County reports the planting of 126,908 deciduous fruit trees in the past four years.

Hop growers of Mendocino County have organized a selling association which will affiliate with similar organizations in Oregon and Washington.

Jersey breeders of Humboldt County have organized an association, electing Dr. Harold Gross of Eureka secretary and S. P. Kelly of Ferndale secretary.

The State Dairy Association and the California Creamery Operators, which recently met in joint session at Modesto, have decided to meet next year in San Francisco.

At the recent meeting of the Humboldt County Dairymen's Association at Ferndale, Farm Adviser Christiansen discussed the advantages of tuberculin testing for dairy cows.

Many entries are being received for the poultry show to be held at Sacramento the first week in November. N. E. Luce of Los Angeles and C. G. Hinds of Oakland have been selected to judge poultry.

Central California

Lemon Cove, Tulare County, reports an unusually fine crop of oranges.

According to recent reports more than 75 per cent of the raisins of Tulare and Fresno Counties have already been contracted.

The women's clubs of Exeter, Tulare County, will hold a chrysanthemum show beginning November 5 and continuing three days. Entries are being made from all parts of the county.

More than 50 per cent of the raisin crop under the control of the California Associated Raisin Company has already been sold. The association markets about 90 per cent of the entire raisin crop of the state.

Hog raisers of Stanislaus County held a meeting in Modesto last week to consider organization for the purpose of fighting cholera. The idea of this organization is to prevent the spread of the disease rather than to cure it after it appears.

A shipment of sugar cane seed is en route to Visalia from Arizona and will be immediately planted by ranchers who have signed for it. The seed to be received will plant about 15 acres. The shipment is merely an experiment to see if the growing of sugar cane in the county can be accomplished.

Over 20,000 pounds of Fresno raisins were shipped to Copenhagen last week as part of a cargo of dried and canned fruits. This shipment was very much lighter than is usually needed to fill the Danish demand for California raisins. On account of the European war it is thought that no larger orders will be received.

Southern California

Calexico's new cotton compress is now ready for business.

There was a large exhibit of pigeons and rabbits at the Riverside county fair.

Dried fruit growers of Southern California are hoping for a big demand next year from Europe.

The Arlington Heights Fruit Association has elected the following directors: W. G. Fraser, W. H. Robinson, J. H. Urquhart, B. K. Marvin and F. A. Little.

The Santa Ana chamber of commerce announces that some 35,000 red geranium plants are ready for distribution to be planted along the highways of the county.

The olive crop in Southern California is estimated as 75 per cent of normal with promise of excellent quality. The output of the state will total about 15,000 tons.

Chili pepper growers of Orange County are planning to form a co-operative marketing association. A meeting was held recently at Garden Grove to inaugurate the movement.

At the close of this season's run on refined sugar the Anaheim factory expects to continue the run some four weeks to turn out brown sugar. It is thought that some 4,000 sacks will be manufactured.

Farm Adviser Parker of Ventura County announces that the bureau will conduct a market exchange. Any member of the bureau having an article for sale may list it with the adviser at Ventura.

The Coast

Wenatchee, Washington, is shipping out 100 carloads of apples daily.

Utah wool growers have practically completed arrangements for the meeting of the National Wool Growers' Association, which will be held in Salt Lake November 10-14.

Cattlemen of Cochise, Santa Cruz and Pima Counties recently met at Turner, Arizona and organized an association to protect and promote the interests of stockmen.

A Japanese farm corporation has been formed at Ogden, Utah, under the name of the Yamato Land and Trust Company. Members of the company are all Japanese.

The officials of the Arizona Cattle Growers' Association are expecting an attendance of 500 at the annual convention which is to be held in Douglas January 4, 5 and 6. The question of leasing the state grazing lands is expected to be the principal topic of discussion.

The National Mohair Growers' Association has just held its annual meeting at Albuquerque. The following officers were chosen for the ensuing year: President, A. B. Collins, Laguna, Texas; first vice-president, Mrs. M. Armour, Kingston, New Mexico; second vice-president, O. F. Webster, Thatcher, Arizona; third vice-president, John Mahnke, Kelseyville, California; secretary-treasurer, J. E. McCarty, Bluffdale, Texas. The meeting will be held next year in San Francisco.

Our Fruit, Nut and Olive Trees and Grape Vines were awarded the First Prize and Gold Medal at the

1914 STATE EXPOSITION

PRIZE TREES

WHY?

Because we have always been striving for the best and consequently have produced the best.

It was not luck—
To get that prize we had to work hard and conscientiously to produce just what you—the growers—want.

Into the growing of each one of our trees go science, care, and experience. By the intelligent selection of buds and parent trees, by expert application, and because we are located in a foothill district—free from pests—we produce hardy, well rooted—good bearing—disease free—trees—

Better, stronger trees—Larger, finer fruit—and Bigger crops.
All our trees are prize trees—profitable trees, the kind you want.
Buy foothill grown trees. We can supply the best of everything in all varieties.

WHAT ARE YOU PLANTING?

Olives
Apricots
Apples
Pears
Plums
Oranges
Prunes
Walnuts
Pomelo
Peaches
Clingstones
Freestones
Grapes

Think up your wants and tell us.

ASK FOR THIS.

Just say that you want it and we'll send you our catalogue of the best varieties of fruit and nut trees—full of useful horticultural information. Free for the asking.

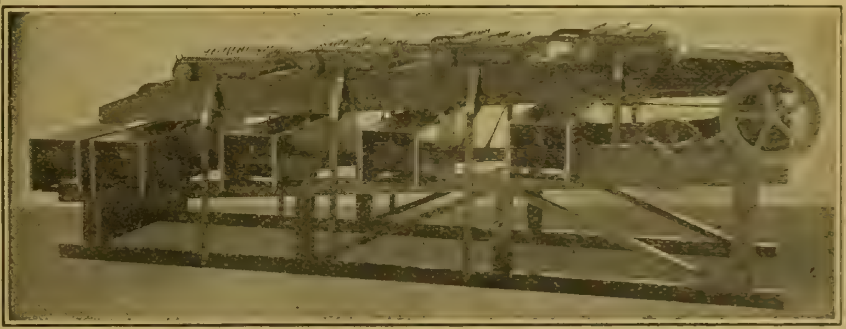
BOX A NEWCASTLE, CALIFORNIA

Grade Your Olives Yourself
and Increase the Value of Your Crop



The Schmeiser Olive Grader

This machine is built in three sizes—separating the olives into three, four and five grades.
The LARGEST or EXTRA FANCY GRADE is separated first, which absolutely prevents their being bruised. This enables you to get the best prices for your crop.
When you sell your olives in bulk the cost of separating, plus a good percentage, is deducted by the purchaser before he makes you an offer.
Why not grade yourself, save some of this cost and entirely eliminate the percentage.
The three-grade machine is operated by hand power.
Write for prices, terms and information.

Schmeiser Manufacturing Company, Davis, Cal.

Get All the Butter Fat

To operate at *full efficiency* and deliver *all* the cream, your separator must be lubricated with an oil exactly suited to its construction. Many oils form "gum", thereby clogging the delicate mechanism of the separator, and thus causing irregular spinning of the bowl, reduction of speed and consequent loss of cream.

Standard Hand Separator Oil

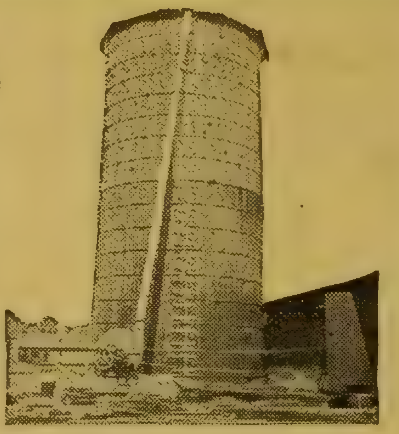
is made especially for cream separators by oil experts of 40 years experience who have studied the detail construction of the separator—this in order to produce an oil exactly adapted to the purpose. Your separator will do better work, last longer and need fewer repairs if lubricated with Standard Hand Separator Oil. ***No matter what you pay, you cannot buy a better oil for the purpose.*** Dealers everywhere.

Standard Oil Company
(CALIFORNIA)

SILOS

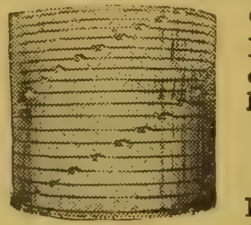
All sizes and dimensions made to order for your particular conditions.

This is a Photo of the 20x40 Redwood Stave Silo Manufactured and erected by us on the Sheldon ranch, Kenwood, California.



TANKS

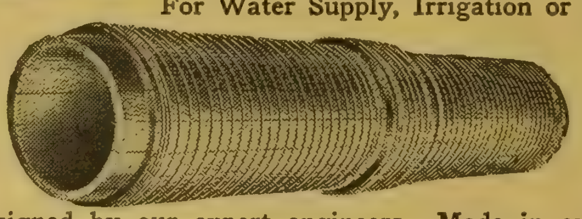
From 500 to 500,000 gallons capacity.



Built to suit All Uses and Users. Cheaper than Metal Tanks, last 10 times as long.

PIPE

Machine Banded or Continuous Stave. For Water Supply, Irrigation or Power.



All Designed by our expert engineers. Made in our own immense factory from clear, air-dried redwood, selected from Air-Dried Stock of 40 Million Feet, which we carry at our plant at ALL times. Write Us for Prices.

Live Stock and Dairy

LIVESTOCK VERSUS GRAIN AND OTHER OBSERVATIONS

By Sacramento Valley Contributor

THERE is a big ranch in the Sacramento Valley on which a big crop of grain was raised this year. The soil is good and the yield was heavy. In the growing of grain there is a big cash outlay and a comparatively large force of men is necessary at certain seasons. When one grain farmer needs men every other grain farmer in the vicinity has the same need. Consequently wages are high. And when work is plenty laborers are independent. "We keep three gangs in motion when we are busy, one coming, one at work and one going in the busy season," said one of the foremen on this ranch, "and none of them are willing to give a dollar's worth of work for a dollar."

Some of the land on this property produces good alfalfa without irrigation; other parts have irrigation available. As fast as it is possible alfalfa is being planted and stock is being taken in to pasture on it.

A fee of from three to seven cents per head per day is charged for cattle, depending on the size of the animals, and pure water is provided. The fields to be pastured are indicated by the owner so that there is no danger of overgrazing and injury to the land in wet weather, etc. There are many fields that can be pastured 200 days in the year—most of them more—and at least one head per acre can be carried during this time. A conservative estimate of average returns would be 200 days at five cents per day, or $10 per acre annually. And this with very little expense, because a foreman and one man can look after the gasoline pumping engines and repair fence on several hundred acres.

With this system carefully followed out the land is enriched, for nothing is taken off save in the carcass of the animals, and when the time for more intensive cultivation comes a good foundation for a long cropping system has been laid.

Interest in Silos

The interest that is being taken in silos in the Sacramento Valley this fall is very pleasing to all who have known what a great factor in the profitable development and advancement of the dairy industry in the eastern states the silo has been.

A number of silos have been built and filled with corn, and more are contemplated by farmers who have late corn that they want to get the full feeding value from.

We know of one progressive farmer who grew a big crop of barley hay on a piece of land he had levelled for alfalfa but that he wanted to "settle" with a season's irrigation before seeding the alfalfa. After taking off the barley crop he sowed milo maize and Egyptian wheat in drills, giving the land a thorough irrigation before preparing the seed bed. It has been irrigated once since, and now much of it is 10 feet high and still green (October 26) and although the grains in the heads are mostly in the "milk" or "dough," some are hard and mature. He will have a big tonnage of feed per acre if he can save it in good shape, and he is now about to buy a good stave silo. With a lot of alfalfa, plenty of hogs and young stock, an orchard started, and a good piece of land and a good water right, this man is in a business that knows very little about panics and hard times.

The day is not far off when every good diversified irrigated farm in the Sacramento Valley will have one or more silos.

Sacramento Valley Farm Essentials

There are a good many things essential to the success of a diversified irrigated farm in the Sacramento Valley. There must be alfalfa and livestock and trees if the highest development and profits are to be secured.

A great many new farms have been started, and more will be in the next few years, and to those who have such we would most earnestly suggest that hay sheds of ample capacity—and silos—are two essential things that will be big factors in the successful working out of the affairs of the place.

Nothing makes such sure and steady revenue on a new irrigated farm as livestock, dairy cows, hogs, sheep, steers and poultry. Feed, good rich succulent feed, every day in the year, is necessary to the most successful conduct of the livestock business. Hundreds of farmers this fall have an abundance of good alfalfa hay in the stack that must be baled and sold, or moved before the winter rains come, or much of it will be spoiled. If they could have had big hay sheds to have put it in direct from the field they would have been saved hundreds of dollars in labor and thousands of dollars worth of hay that will be lost. Every time a forkful of hay is moved unnecessarily it costs money and lessens the profits for the year. An ideal system for handling hay on a small farm is from shock to barn or shed in two operations, and from the shed to the stock in one or two more.

With a supply of hay well sheltered there is an abundance of dry, sweet feed rich in protein. Then a silo full of succulent, slightly sour corn stocks and ears will balance this protein alfalfa with a food rich in carbohydrates. And a silo is essential for the conservation of the greatest amount of food value grown in the corn crop.

Hay sheds and silos—let any new farmer head his list of essentials in the way of improvements and buildings with these.

A New Settler's Dairy Problem

Whenever a farmer moves to a new country he finds new conditions. The climate is generally different and there is frequently a perplexing difference in soil conditions.

In the Sacramento Valley, for instance, there is a great deal of soil that is called "heavy." This means that it is composed largely of silt and clay and that unless the moisture condition is just right it is hard to work into the mellow granular condition of more sandy land. The soil is much richer than if it contained 20 to 30 per cent of sand, but more difficult to work.

When a man who has farmed sandy soil buys a piece of this rich but heavy Sacramento Valley land he often has difficulty in adapting himself to the new conditions and sometimes becomes very much discouraged before he realizes how well off he is. All of the good things are offset and set far in the distance by the difficulty in working the soil.

We know of a case of this kind. A man came from Ohio and bought an irrigated farm in the Sacramento Valley. But he and his wife are delighted with the climate. They have never been so well in their lives; they laugh at people who call the summers hot, because the contrast with Ohio heat is favorable to the Sacramento Valley summer weather; and they like the progressive people who are their neighbors. Not only do the people appreciate the climate, but the long open season, grazing and out of door life, practically every day in the year, is very pleasing to hogs and chickens and cows, and a larger average yield of cream per cow is being made than in Ohio. And because hogs can make growth and pork out of practically all of the feed they consume, instead of using a lot of it to keep up bodily heat against the cold weather, they mature earlier than in the east.

But because the soil is more difficult to handle these good people had become very much discouraged and had almost decided to quit and go back and "start over again" there.

And this is what changed their minds and made them contented and useful citizens of a new community that needs them and many more of their kind. A friend with whom their

Warranted to Give Satisfaction.

Gombault's Caustic Balsam

Has Imitators But No Competitors.

A Safe, Speedy and Positive Cure for Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a Human Remedy for Rheumatism, Sprains, Sore Throat, etc., it is invaluable. Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. ☞Send for descriptive circulars, testimonials, etc. Address

Make Your Barn Pay *Real* Profits

The Louden Way

Make your new barn a modern barn, even though it is small. It will cost you less and pay you more every day it stands, in labor saved and in more productive cows.

Louden Barn Equipments are the only really economical, sanitary and comfortable barn equipments, and are the greatest labor savers ever invented for the farm. Used all over the world by good business farmers and dairymen—by men who know what pays and why, and who will not pay a cent for mere frills.

USED ALSO IN MOST STATE AND U. S. GOVERMMENT STABLES WHERE ONLY THE BEST IS INSTALLED.

Simple in design, strong in construction, easy to install, outlast the barn, and their cost is so little that you cannot afford to do without them even if you have but few cows.

The Louden Line Consists of:

- Louden Steel Stalls and Stanchions,
- Louden Feed and Litter Carriers,
- Louden Bird-proof Barn Door Hangers,
- Louden Mangers and Manger Partitions,
- Louden Maternity Pens, Bull Pens, Calf and Hog Pens,
- Louden Alignment and Go-right Devices,
- Louden Power Hoists, Hay Tools and many other labor savers and money makers for the barn and farm.

Illustrated catalog free on any of these equipments.

Our barn building experts are at your service. Send for free suggestions and preliminary sketches. Let us save you money and trouble in planning your new barn or remodeling your old one.

BLACK LEG

LOSSES SURELY PREVENTED by Cutter's Blackleg Pills. Low-priced, fresh, reliable; preferred by Western stockmen, because they protect where other vaccines fail. Write for booklet and testimonials.

10-dose pkge. Blackleg Pills $1.00
50-dose pkge. Blackleg Pills 4.00
Cutter's Blackleg Pill Injector 1.50

Discounts: 250 doses, 10 p. ct.; 500 doses, 20 p. ct. Use any injector, but Cutter's simplest and strongest. Every package dated, unused pills exchangeable for fresh after date on package. Do not use old vaccine (ours or any other), as it affords less protection than fresh. Insist on Cutter's. If unobtainable, order direct. Send check or M. O., we pay charges and ship promptly. THE CUTTER LABORATOPY, Berkeley, California.

problem was discussed asked one simple question: "Admitting all that you say about the land being hard to handle, once that you do get it in alfalfa, how many more cows per 40 acres can you keep than you could in Ohio?"

Our discouraged friend admitted that he could keep two or three times as many and that as he manured the land to make it more open, and as the alfalfa roots kept opening up the soil and subsoil, this carrying capacity would increase, and that by raising a small field of corn each year and putting it in a silo more stock per acre could be carried.

There are some things about every country and every locality that we would change if we could, and we need to "take stock" occasionally to see how well off we are.

Use of Good Sires as an Object Lesson

Volumes could be written about the value of using good sires, but there is no way that it can be impressed on a breeder of common stock so well as to use one. The first litter of pigs, for instance, from a common sow and sired by a registered boar should be enough better in every way than the balance of the herd to establish the use of pure bred sires forever. They should make more rapid gains and they should produce more revenue.

Most ordinary pigs—just common pigs—look pretty good when they are very small, but as soon as they get a little age their noses get long. They grow sharp and narrow over the shoulders. A great shrinking seems to take place back of the shoulders around the heart girth, showing lung room capacity smaller than it should be. They become very long legged and their hams do not fill down as they should to make the most possible meat.

We know of a most striking example that illustrates the point well. During the past year one very good grade sow has produced two litters of pigs. One lot is sired by a common mongrel boar; the other by a registered Berkshire. Of the litter from the mongrel boar no two are alike and only one even approaches the standard for an ordinary good hog. They are long legged, cat hammed, long nosed and slow growers, even with the best of care and feed. On the other hand the litter from the Berkshire boar are as like as peas, longer bodied and lower to the ground than the best of the mongrel litter. They are so evenly filled out from end to end that a straight-edge laid along their sides would touch from shoulder to ham. Their backs are wide from end to end and their ribs so widely sprung that they are literally covered with meat from their ears to their tails. They are making faster gains than the mongrel litter and should be worth at least one cent per pound more on any market.

Hog Prices

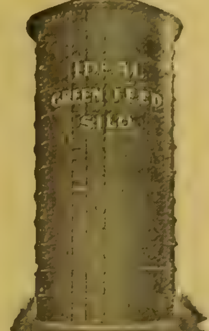
Hog prices have declined from one to two cents per pound during the past three weeks. Stockmen who are in touch with the situation say that there is always a drop when barley fed hogs from the stubble fields come on the market in large numbers. There is a good deal of "feast and famine" to the supply of meat making animals for the Pacific Coast trade.

Pigs that are farrowed on the big ranches in the winter and spring, and some from the preceding year's crop, are grazed through the summer and fattened on barley stubble and sometimes finished on grain. This brings them on the market in September, October and November. Unless a good many hogs are carried on into the winter on grain this run of stubble fed hogs is pretty well over by December. Then from January on to the next September prices should be higher because of a shortage of grain fed, well finished hogs in the country tributary to the California markets.

The aim of the farmer should be to carry over in his granary enough feed to be able to market fat hogs during this "short supply" period.

The little farm flock, well managed, has been the means of converting many farmers to the exclusive sheep-growing and wool-producing industry.

Brood sows should never be allowed to run in the same yards with cattle or horses. Many good sows have been ruined by a kick.



Save That Last Crop of Alfalfa

By Putting It In An

Ideal Green Feed Silo

Alfalfa makes an excellent grade of silage, very palatable and nutritious and carrying a high percentage of protein. By letting this last crop grow to maturity and then putting it into an Ideal Green Feed Silo, you are beating nature at her own game, for it can be siloed in the rain if necessary.

Order Your Ideal Green Feed Silo Now

and get it up ready for this last crop of alfalfa when it matures. You can commence feeding it just as soon as the silo is filled, and by next spring it will be empty and ready to receive the first cutting, that as hay is usually not worth handling, because of the weeds it contains and the trouble experienced in curing it.

Nothing excels silage, especially legume silage, during the dry summer months for keeping up the flow of milk. Next spring's filling will carry you through the best part of the summer, with the silo ready to receive that crop of corn next fall, thus providing a juicy succulent feed all winter which will permit you to reduce the amount of mill feed necesary to buy at least 50 per cent, a saving more than sufficient to pay for the entire outfit.

Order your Ideal Green Feed Silo now and stop buying so much mill feed.

Veterinary Queries

Answers in this column by Dr. Wm Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal

Barrenness

Kindly advise me how to treat a case of barrenness? The cow is medium young and in fairly good condition. Her last calf came about May first and she has been coming around regularly since the last week in July. Have taken her to the bull each time.—Subscriber, Raisin.

The fault may be with the bull. Try another one. Also give her the following tonic: ground gentian four ounces, nux vomica two ounces, sulphate of iron two ounces and farina enough to make one pound. Mix and divide into 16 powders. Give one every night.

Harness Galls

Please let me know through your paper the best way to treat shoulder galls and what salve to use?—Subscriber, Merced.

Oxide of zinc ointment is a good remedy for harness galls. You can get it from any druggist. Be sure that the harness fits properly, and when you remove the harness bathe the shoulders with cold water. Also give a handful of epsom salts in the feed once a day for two weeks.

Lumps in Udder

I had a Holstein cow come fresh about four weeks ago but could get no milk from one of the back quarters. I called a veterinarian, and he used an instrument and slitted the teat four ways when we were able to get about three or four quarts of milk but have never been able to milk her without a milking tube. Now we only get about a pint from this teat. She gives about three gallons from the other three quarters. The affected quarter has hard places in it, and when inserting the milk-tube it strikes an obstruction about an inch from the end of the teat and I find it quite difficult to get it any further. Have been using iodine ointment but it seems to get no better. What can I do for her?—Subscriber, Merced.

The lumps in the udder are due to some form of poison that has entered through the opening. All instruments used should be boiled before using. You may be able to stop it by injecting a dram of iodide of potash dissolved in a pint of pure water. This should also be boiled and cooled to animal heat before using. The lump in the teat should be slitted to start its absorption, but the opening in the end should not be cut.

Caked Udder

I have a cow that has been fresh three months, that gives about five gallons of milk per day, but of late she has been failing in one back quarter and now gives only about a quart from it. This quarter also is more solid than the rest of the udder. What is the remedy?—Subscriber, Merced.

The quarter that is getting hard should be bathed with hot water and rubbed with the hands frequently and the milk drawn from it carefully three or four times a day. A large handful of epsom salts in the feed once a day will thin the blood and help very much in relieving the trouble.

Ringworm

Steer calf about four months old has two small bare spots on his face. The hair is gone from these spots and they constantly grow larger. The spots look like scabs and are evidently due to some kind of skin disease. What is the remedy?—Subscriber, Porterville.

It is probably ringworm. The treatment is to scrub the parts clean and when dry apply an ointment made of two drams of iodine crystals, two ounces of tincture of iodine and enough lard to make four ounces. A few applications of the ointment will stop the disease, but to prevent its spread to other animals the stable and fences where the cattle rub should be whitewashed.

DAIRYMEN:—
write us for information about
LARROWE'S
DRIED BEET PULP
—the milk producing, succulent, vegetable feed

WE want to send you free a copy of our booklet, "Profitable Feeding." It contains valuable information about feeds and feeding—also gives facts about dried beet pulp and how it should be fed. Send for a copy today—a postal will do.

LARROWE'S DRIED BEET PULP

—will increase your milk supply from 1 to 5 lbs. of milk per cow a day, and keep your cows practically free from udder troubles.

It is simply the pure, shredded root of the sugar beet with only the sugar and water extracted. (Can also be had with molasses if desired.) Swells to six times its original bulk when moistened—thus furnishing as great succulence as silage and more than five times as much nutriment. It is also a splendid feed for fattening; for horses, hogs, poultry, etc.

Poultry for Profit

ROUP,—ITS CAUSE AND CURE

Written for the California Cultivator

By Jean A. Koethen

OF all the diseases which afflict fowls no other is of such economic importance as roup. Chicken pox comes and goes, but usually in this climate leaves the fowl as well as it was before. Other diseases are sporadic and occasional, but roup in some localities devastates the flock year after year, leaving the fowls, if they recover, predisposed to fresh attacks, and houses and yards more or less infected with the germs of the disease. Like the colds which afflict human beings, it comes, no one knows exactly how, only, unlike ordinary colds, it does not run its course and leave. Roup is a cold and more than a cold. There is something malignant about the germ which causes it, and it passes rapidly from bird to bird, picking always the weaker ones till a large part of the flock is affected.

When I am asked the cause of roup I feel myself at a disadvantage. I can answer, "bad air at night, drafts on the head from cracks and knot holes; dampness, exposure, inherent weakness and predisposition to roup, contagion," and all the other reasons usually given, just as glibly as I could once "bound" Ohio or give the capitals of the Atlantic states, but this does not satisfy me. I know that many cases of roup occur when fowls are kept in open front houses and carefully protected from drafts, and when the ground has been dry for months, so there must be something more fundamental than any of these causes, potent as they are.

My own hens never have roup. In three years I have not seen a case. To be sure they sleep in open front houses, but four years ago, when we lived in Los Angeles, my hens were in open front houses, yet they had roup summer and winter. In the valley where we are now I have never heard of a case of roup nor seen any one who had heard of one. It is, in short, a roupless locality.

I shall not give the name of this happy valley, lest I be accused of "boosting." Doubtless there are many similar districts, for I am satisfied that wherever we find similar topographical conditions we shall find the same freedom from roup and similar diseases. It may be of some use, however, at least to those who are looking for a location for a poultry farm, to examine the "lay of the land" which makes for rouplessness.

The chief characteristics of this valley are (1) a uniform southern slope, (2) protection by hills from the chill coast winds, (3) entire absence of any sort of draft, (4) decomposed granite soil. In other words the chief elements in eliminating roup are perfect air and water drainage.

We are familiar enough with the dictum that a poultry house should be built on soil which is well drained, but how often do poultry house builders stop to consider air drainage? Whether it is because of the excessive heat of their bodies or on account of the sensitiveness of their head appendages, the fact is that fowls are extraordinarily sensitive both to drafts and to dampness in the air, and both these conditions are dependent upon air drainage. If the house is lower than the surrounding country, the damp air, which always seeks its lowest level, settles about it. If it is in a hollow or ravine, or even a good-sized arroyo, there will be not only the settling of the damp air about the house at night, but a draft of air drawing through in the daytime, and roup is the consequence.

I don't think proximity to the coast has anything to do with roup, but protection from the sharpness of the coast wind has much to do with it. This protection may be given most effectively by a range of hills to the east or north. When the hill or dune is on the west, and the ground falls away toward the east, I should expect to find more or less roup. On the high ridge in western Los Angeles, where I fought roup for two years, we had perfect drainage, but the adobe soil was against us, for adobe does not carry off filth and poison as do sand and decomposed granite and the coast wind blew across the ridge at a terrific rate. We had also too much shade, for, while shade is very necessary to the welfare of fowls, the sun is even more necessary, and a torrent of cold air drawing through dense shade makes the best combination I know of for producing roup, bronchitis, and rheumatism. Had we cut away all but one of our trees and built some sort of windbreak, either at the top of the ridge or below, in the direction from which the wind came, I think we could easily have prevented all these troubles.

I would not be understood to minimize the effects of bad ventilation as a cause of roup and all kinds of colds. Without doubt proper attention to ventilation, windbreaks and sanitation in general will do much to overcome the effects of an unfortunate location, but I believe there are some localities where it is very difficult, if not actually impossible, to prevent occasional outbreaks of roup, and the prospective poultryman who has it in his power to choose should study the matter carefully.

Symptoms and Forms of Roup

Roup appears in various forms; sometimes it affects the eyes, sometimes the throat; sometimes it appears in abcesses under the eye or about the head; sometimes one eye is swollen and glued shut with a sticky discharge; sometimes the bird is droopy and depressed, refuses to move or eat; sometimes it seems fairly comfortable. But there are two symptoms that in real roup are never absent. These are a discharge from nostrils and eyes, which may be rather thin at first and becomes thick as the disease progresses, and a putrid odor which always accompanies it. A cold which has no offensive odor is not roup. If you go to your chicken house at night, and on putting your head in, notice a sickening odor, you may know you have roup somewhere, even though you have not detected anything unusual about the birds before. This is the one sign that never fails.

In the severer forms of roup the bird always seems very ill, but sometimes there is only a swollen eye or a discharge from the nostril, and the bird does not seem greatly inconvenienced. As long as there is an odor, however, be sure it is roup, and that it is contagious.

The One Cure

Robinson says, "I long ago ceased to doctor roup, because I found that as long as I doctored roup I had more roup," and this is the experience, in greater or less measure, of every experienced poultryman. "Give him the ax" is the prescription of the expert, and hard as it seems, it is the best way. The fowl that has been cured of roup keeps the seeds in its system, and if it does not itself show the disease again will very likely transmit the tendency to its offspring.

For those who feel obliged to doctor there are plenty of cures. The simplest of these is the potassium permanganate treatment, which has been mentioned on this page several times. Kerosene is sometimes effective. Put just a little in a quart cup of water, just enough to make a slight film on the top, and dip the bird's head under, holding it there while you count ten. A little kerosene in the drinking water, or even in the wet mash, is recommended by some.

Dr. Salmon, in "Farmers' Bulletin 530," recommends the following solutions into which the bird's head may be plunged:

Boric acid, 1 ounce; water, 1 quart.

Permanganate of potash, 1 dram; water, 1 quart.

Boric acid, 1¼ ounces; borate of soda, ½ ounce; water, 1 quart.

Peroxide of hydrogen, 1 ounce; water, 3 ounces.

Argyrol is recommended for cases where the inflammation has reached the eye. One or two drops of a 15 per cent solution is introduced between the eyelids twice daily for several days.

If there are abcesses they must be opened with a sharp, clean knife, and the cavity washed with one of the above solutions. A pledget of cotton moistened with the solution may be left in the opening for an hour or two or it may be dusted with iodoform.

From these directions it seems that one really needs to be a trained nurse in order to doctor roup properly, and of course treatment of a whole flock is utterly impossible. Prevention is the easiest way, and the only way that is permanently successful.

SAN MATEO COUNTY SHOW

Mr. Fred West of Burlingame, California, sends premium list and rules covering the third annual Poultry show of the San Mateo County Poultry Association, which will be held in Redwood City November 12-15. W. S. Russell will judge all classes.

EVERYBODY CAN CANDLE EGGS

To enable farmers and housewives to test eggs before a candle and tell accurately their condition before they are opened, the department of agriculture has just published a colored egg-candling chart. To give a true picture of the eggs, 12 impressions were necessary to produce this lithographed chart.

This chart shows the eggs in their natural size as they appear before a candle, and also as they look when open in a glass saucer. The pictures include an absolutely fresh egg, slightly stale eggs, decidedly stale eggs, eggs with yolks sticking to the shell, eggs where the chicken has developed so far that blood has been formed, moldy eggs, addled eggs, and eggs with a green white.

Comparatively few housewives are aware that a green color in the white of eggs is due to the presence of billions and billions of a certain

(Continued on Page 455.)

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Bean Straw—Alfalfa Meal

Please give value of lima bean straw compared with alfalfa meal.—Subscriber, Glendale.

We have written Professor Jaffa of the state university for information as to lima bean straw. From the tables at hand we learn that soy bean straw analyzes 10.1 per cent water, 5.8 per cent ash, 4.6 per cent protein, 40.4 per cent crude fiber, 37.4 per cent nitrogen free extract, 1.7 per cent fat. Alfalfa hay analyzes 8.4 per cent water, 7.4 per cent ash, 14.3 per cent protein, 25 per cent crude fiber, 42.7 per cent nitrogen free extract, 2.2 per cent fat. From this analysis it will be seen that the alfalfa is more than three times as rich in protein as the bean straw.

Pine Needles for Mulch

On my sandy soil will pine needles spread and plowed under act as a fertilizer? Is land on which redwoods have grown better than other soils? —Subscriber, Santa Cruz.

We see no reason why pine needles would not make an excellent mulch for sandy soil. If plowed under good and deep it should certainly benefit the soil and give better water holding capacity. Bear in mind, however, that if a very heavy supply is plowed under an abundance of water would be necessary for the first few months. We doubt not the soil under redwood trees would be very rich because of the leaf mold which has been forming for hundreds and even thousands of years.

Melon Blight

What causes roots and vines of melons, cucumbers and tomatoes planted on sandy soil to decay and die? The roots were covered with knots or warty appearing bunches.—Subscriber, Hanford.

This may be caused by blight, though we rather think it is caused by nematodes, exceedingly small worms which infest the soil and attack the roots until the plants die. In either case the only remedy is to secure clean land another year, giving this particular soil over to culture of other crops which will not be affected.

Onions From Sets

Will onions from ripened sets produce as large and good onions as where grown directly from seed?—Subscriber, Hanford.

Yes.

Value of Pumpkins

What is the feeding value of field pumpkins or squashes as compared with hay, either alfalfa, oat or barley? —Subscriber, Santa Paula.

Field pumpkins analyze 90.9 per cent water, 0.5 per cent ash, 1.3 per cent crude protein, 1.7 per cent fiber, 5.2 per cent nitrogen free extract, 0.4 per cent fat. Alfalfa hay analyzes 11.8 per cent water, 7 per cent ash, 14,9 per cent crude protein, 24.2 per cent fiber, 37.8 per cent nitrogen free extract, 4.3 per cent fat. This is an average of 12 analyses reported in Henry's Feeds and Feeding. The same book gives barley as follows: 15 per cent water, 4.2 per cent ash, 8.8 per cent crude protein, 24.7 per cent fiber, 44.9 per cent nitrogen free extract, 2.4 per cent fat. Oat hay analyzes 15 per cent water, 5.2 per cent ash, 9.3 per cent crude protein, 24.7 per cent crude fiber, 44.9 per cent nitrogen free extract, 2.4 per cent fat.

Three Per Cent Loans

Please give information as to the government making three per cent loans to farmers.—Subscriber, San Jose.

The time may come but it is not here yet. If it does it will probably be through a banking system which will permit the farmers to deal directly through their own local bank.

Book on Celery

Where can I get information regarding celery culture?—Subscriber, Eureka.

We believe there is no book published on this subject. The Cultivator hopes soon to give an article by one who is thoroughly informed on the culture of celery in California.

OLIVE TREES

OLIVES
WORKED ON
PICHOLINE ROOT

have a stronger growing and deeper feeding root system than those grown from cuttings. Mission Olives worked on Picholine Root are more thrifty, grow larger, and are more heavily productive—that means more profit.

The foundation of your trees is THE important feature. In addition to working our Olives on Picholine seedling, we cut our wood from a fine strain of trees having a good record for productiveness and size of fruit.

In buying trees, you want the best—the first cost is no consideration. We have a limited number of Olives on Picholine. Write us now and reserve the trees you want.

The Future Man or Woman

The food taken by the nursing mother influences the physical development of the child. Children should be fed on nothing but the most strengthening foods.

Ghirardelli's Ground Chocolate is both a food and a drink.

Children need no coaxing to take it. They like it and thrive on it. It is the final expression of purity, wholesomeness and deliciousness.

The cost is less than a cent a cup. Begin using it tomorrow.

In hermetically sealed tins.

Quality, strength and price remain the same.

Ghirardelli's Ground Chocolate is the only original ground chocolate. It has been used in Western homes for over a third of a century and its popularity is growing day by day.

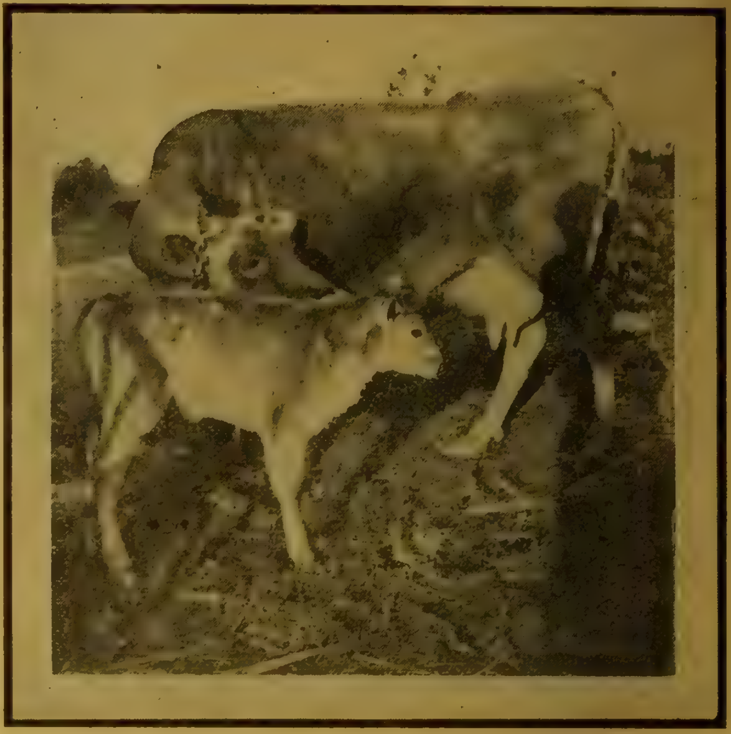
November Prize Photo Contest

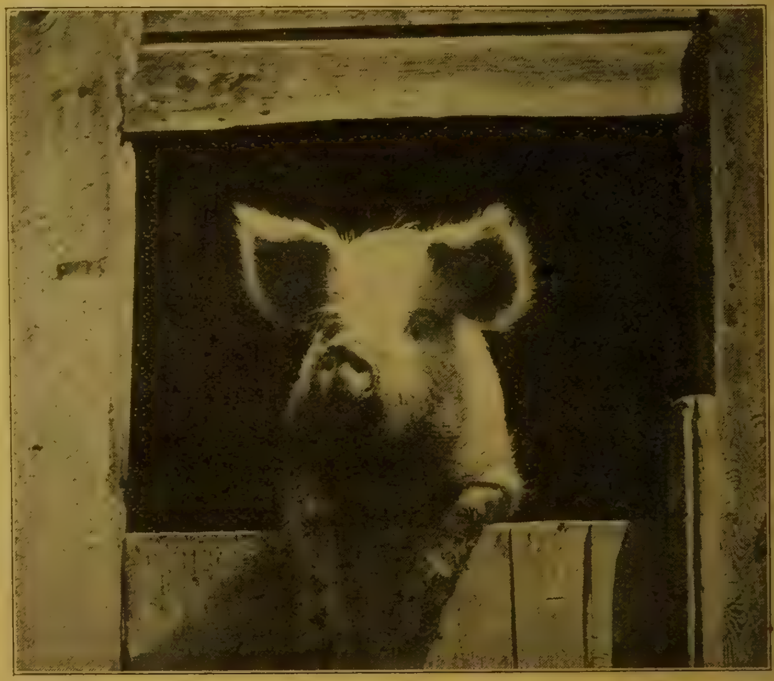
THE present attitude of the swine industry in California is shown very plainly in "The Face in the Window," one of the prize winners for November. There seems to be nothing retiring in the position taken by Mr. Hog. If the feed isn't coming he wants to know why.

The other prize winner is typical of the dairy industry of the state. It's being mothered. It is growing under the mothering, and well it may, fo it is the source of much of our prosperity.

Speaking of hogs and cows and hog pictures reminds us of a bunch of photographs which appeared in the August issue of Camera Craft of San Francisco, an excellent magazine, by the way, which will have interest for everyone making photographs of farm scenes. The August issue has an article on photographing cows and chickens, and in the article are a large number of photos with text touching upon methods of securing them, which should prove a splendid help to the amateur photographer. To give an idea of their common-sense way of treating the subject, we quote:



SOLICITUDE
First Prize Photo by Mrs. Minnie Carner, Orange



THE FACE IN THE WINDOW
Second Prize Photo by J. M. Reen

"I shall never forget the first picture of a chicken that I made. A fellow had won a prize with one of his birds at the local poultry show; and, proud as Lucifer, he wanted a portriat of it. At that time I knew as much about a chicken as a pig does about its grandfather, but I didn't let Mr. Poultryman know it. I told him I would be around in the afternoon and make the picture. Then I sat myself down in the old rocking chair and thought it over. A chicken! For the life of me, I could not see how I was going to get a picture of a chicken that would look right to an expert chicken fancier. To start with, the darned things were never quiet; how on earth was I ever going to get a picture of a hen when it would not keep its head still? But here, they do keep their heads still—sure they do; they move in jerks,—a quick movement, then a momentary pause to get their bearings, and then another jerk. There was nothing to it; I would snap the shutter as the hen jerked its head and catch it during the pause. That was the first real step towards success. I told the man frankly that he would have to pose his bird and that I would get the picture when he told me the position was correct. That being satisfactory, I went ahead and made the picture; and, strange to say, it was all right.

"Photographing dairy cattle is one of the most difficult propositions that confronts the man who has the temerity to boast of his ability to photograph animals. These, perhaps the most useful as well as the most valuable of all domestic mammals, demand careful attention at the hands of the photographer, as he can, through lack of care, so mar the appearance in the finished result as to make the cow or bull appear positively deformed. It can readily be seen that a man is ill advised who attempts to photograph dairy animals without some knowledge of the subject.

"There are some fundamental requirements that apply to pictures of all animals that should be made of first consideration in attacking the subject of cattle portraiture. The animal must stand on all four feet, the head must be erect, the back level, the carriage graceful, the eye clear and bright, the ears pointed forward and the tail must set at a proper angle to the body. In addition, each of the several breeds have characteristics of their own that must receive the careful attention of the photographer."

An article in the September issue of the same magazine, "Photography by the Naturalist"—and every farmer should be in that class—has some beautiful reproductions of butterflies and even scale insects and aphis doing their work of destruction on live plants.

Get the copy of Camera Craft above referred to and do some fine work for the next contest.

Next Month's Prize Offers

Photos for the first issue in December should reach the Cultivator office not later than November 24. The next day is Thanksgiving, and we take it that some Thanksgiving photo will be a prize winner for the first issue in January.

The prizes will be two dollars for the first prize-winner, $1.00 for the second, and then for all photos which are accepted and retained, a six months' subscription to the California Cultivator will be given. We will only keep photos from which we can make clean-cut engravings. This means that everyone who sends a photograph which will answer for an engraving will receive a prize. Photos for the December contest should be in this office by Tuesday, November 24.

If you or some member of your household is now receiving the Cultivator, send in that name with your photo so that if you receive a six months' subscription it may be given as an extension of the existing subscription. That will probably be more satisfactory to you than to receive an additional copy for the coming six months.

THE NEXT PRIZE CONTEST

For the best short article on "A Safe and Sane Christmas" $2.00 cash; for the second best, $1.00; for all that are published, six months' subscription to the California Cultivator.

Read the prize offer on Page 379 of the Cultivator of October 15.

All articles for contest should be addressed to California Cultivator, Los Angeles, and should be in this office by Thursday, November 12. They will appear in the issue of November 19.

With your article send suggestions for subjects of future contests. Also when you write send name of member of your family to whom you wish the subscription to go—you might be one of those who will receive a subscription, and if your paper now comes in husband's or brother's name, let us know so that subscription will be extended six months instead of an extra copy going each week to you for the coming six months.

Photo Contest

The next photo contest will close Tuesday, November 24, and prize winners will appear in the first issue of December. What do you think of this month's prize winners on this page? Next month the offer will be the same. Try your luck this time.

IDEAS FOR THE COOK

Written for the California Cultivator
By Isabel Cottle

Breakfast

Corn Meal Mush, Cream
Salt Pork in Batter   Fried Apples
Muffins   Coffee

Lunch or Supper

Cream of Celery Soup
Browned Riced Potatoes
Broiled Chipped Beef
Tomato Salad
Creamy Rice Pudding
Tea or Milk

Dinner

Creamed Fish with Potatoes
Ecalloped Turnips and Carrots
Spinach Salad, Mayonnaise
Scotch Scones   Grape Marmalade
Pumpkin Pie   Coffee

Scotch Scones

Sift one pint of flour twice with a teaspoon each of salt and sugar, also three teaspoons of baking powder. (If made with sour milk use one-half teaspoon of soda and one of baking powder.) Rub into the flour three tablespoons of butter, also add yolk of an egg. Moisten with milk, roll lightly until round in shape, cut into quarters, brush over with milk and bake quickly.

Creamed Fish With Potato

Melt two tablespoons of butter, blend in three tablespoons of flour, mixed with one-half teaspoon of salt, dash of pepper, pour in slowly one and one-half cups milk, stir and cook until smooth and add one and one-half cups of finely flaked cooked fish. Beat the white of an egg until stiff, stir it into one cup of well seasoned mashed poptato and beat with a fork until very light. Butter ramekins, half fill with the creamed fish, spread roughly with the potato, sprinkle with grated cheese and bake in hot oven until brown.

Creamy Rice Pudding

To one-third cup of well washed rice add a scant cup of sugar, a scant teaspoon of vanilla, a little salt and two quarts of rich milk. Bake for two and one-half hours in a slow oven, stirring two or three times during the first hour. Serve very cold with cream.

Tomato Salad

Heat two cups canned or fresh tomatoes with two cloves, one-fourth bay leaf, one teaspoon salt, one teaspoon sugar, and one-half teaspoon paprika. Soak one tablespoon gelatine in one-fourth cup cold water for ten minutes; add to hot tomato mixture and stir until gelatine is melted; strain and set in cold place until nearly jellied, then add one cup cucumber cubes, and more salt and lemon juice if desired. Turn into small molds and set away to become firm. Serve with mayonnaise.

People who borrow imaginary troubles may have the real kind to lend.

Successful agriculture means selling without waste.

The Challenge in Firestone Quality

EXTRA rubber and extra fabric, built layer by layer into a tremendous strain resisting unit—this means more mileage.

Better facilities, better workmen, closer inspection—in short, the Firestone Quality—more mileage.

Firestone

Non-Skid Tires assure you also the economy in cost which goes with immense volume of the world's finest tires, prepared in America's Largest Exclusive Tire Factory. Extraordinary service at ordinary price.

Roeding's New Plan for Planters

—a plan that means protection for you against costly mistakes—that insures every planter a full reward for his money and labor.

WE can't begin to state in this small space the extent and value of the service which we are offering to planters FREE. No matter how small or how large a number of trees or vines you anticipate planting, you should get in touch with us at once. Tell us what you think of planting; state your soil and other conditions—and we will gladly send you full details about our new plan. Remember, it is free and costs you nothing. Write us today for details.

Roeding & Wood Nursery Co.

1607 E. Washington St., Los Angeles, Cal.

10 Packages Seeds for 25c

Send 25c and I will send you these seeds, one regular sized package of each: Acme Tomato, Ponderosa Tomato, Early Spring Cabbage, Premium Late Flat Dutch Cabbage, Davis Perfect Cucumber, Hoodoo Muskmelon, Big Boston Lettuce, French Breakfast Radish, Mixed Zinnia, Mixed Poppy.

SEEDS & TREES THAT GROW IN YOUR STATE

Citrus Fruit Market

LOS ANGELES, Nov. 4, 1914.

The year ended with fairly good record. At no time were there large prices; at no time were there disastrous conditions. The total record for the state did not reach the 50,000 carloads predicted by many, but came wonderfully near that figure. To handle such an immense crop in the face of large productions of many other fresh fruits and financial stringency has called for great skill on the part of the marketing agencies. We believe there is reason for congratulation. The new year starts with a few Valencias yet to go. They are commanding fair prices, but the immense quantities of apples being sold to the consumer at exceedingly small prices are affecting the clean-up of last year's crop, also of the new Navels and the new oranges from Florida. The present prediction is that next year's output of oranges will be less than last year's by 1500 Navels and 100 Valencias. Big sizes, which are now promised, may possibly change these figures somewhat.

Lemons will be about double last year's output.

Shipments

Total shipments of oranges from all California for the year ending Oct. 31 were 45,306, of lemons 3032, of all citrus fruits 48,338.

Shipments of oranges from Southern California for the year ending October 31, 39,024 cars, lemons 2954, total 41,978. For the year ending October 31, 1913, oranges 13,574 cars, lemons 2192, total 15,706. For the year ending October 31, 1912, oranges 30,327 cars lemons 5961, total 36,288. From Tulare County, this year, oranges 5878, lemons 73, total 5951. Last year, oranges 1855, lemons 111, total 1966. From Butte County, this year, oranges 404 cars, lemons 5, total 409.

NEW YORK, Nov. 2.—Twenty-three cars Valencias, one car lemons sold. Market steady on Valencias, strong on lemons. Partly cloudy.

VALENCIAS—	Avg.
Gold Elephant, Eleph. Orchard	$3.00
Gray Elephant, Eleph. Orchard	2.85

BOSTON, Nov. 2.—Eight cars oranges, one car lemons sold. Cool, cloudy. Market is doing better on oranges, easier on lemons.

PHILADELPHIA, Nov. 2.—Eight cars sold. Cool. Ten cars Florida oranges sold. Market declining. Florida oranges, $1.65 to $2.65; grapefruit, 85 cents to $2.20; average $1.45.

CINCINNATI, Nov. 2.—Cool. Market steady. One car oranges, two cars Florida grapefruit sold. Florida oranges sold from $1.25 to $2.25; grapefruit, 65 cents to $2.15.

PITTSBURGH, Nov. 2.—Two cars oranges, one car lemons sold. Cool.

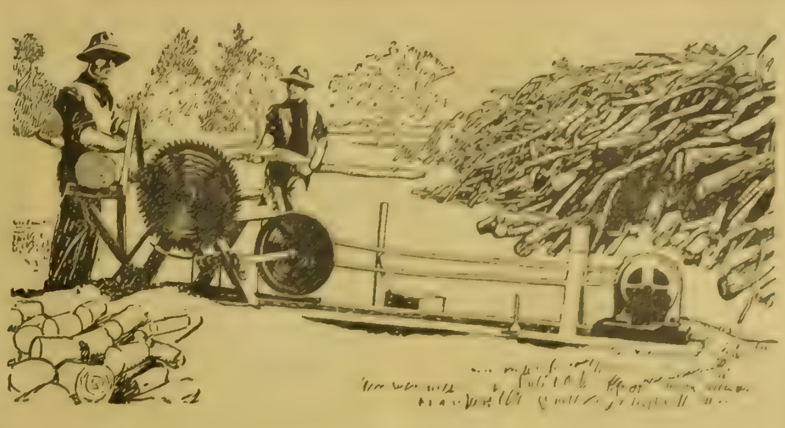
ST. LOUIS, Nov. 2.—Clear and cool. Market strong on small sizes oranges; strong on lemons. Three cars Valencias, one car lemons sold.

EVERYBODY CAN CANDLE EGGS

(Continued from Page 449)

species of bacteria that make a green coloring matter. Eggs with this greenish tint, even though the yolks seem to be perfect, are not fit for food.

As long as the department's supply lasts, these charts will be furnished free upon application to Editor and Chief, Division of Publications. Commercial shippers of eggs, however, should apply for Departmental Bulletin 51, a technical paper on testing by scientific methods not available to the average farmer. This bulletin includes the colored illustrations. The chart alone will be found to be not merely of great service to the housewife wishing to test the eggs she is to serve to her own family, but also of commercial value to farmers, country merchants, or egg shippers who wish to buy and handle eggs on an accurate quality basis.



Ranching by Electricity
A Real Economy

Here is a 5-horsepower G-E motor mounted on a sled. The equipment is in daily use on the ranch of E. A. Smith, Napa, Cal.

In the photograph the outfit is shown sawing wood, but sawing wood is only one of its many duties. The sled is moved around from place to place, wherever power is required, to grind feed, cut ensilage or to pump water—saving its owner money, because of the great amount of work performed at small power cost.

All over the West and Northwest, ranchmen, stockmen and farmers are enthusiastic over

G-E ELECTRIC MOTORS For RANCH AND FARM

Convenience, economy and ability to get through hard jobs quickly and well have made G-E motors the favorites.

G-E Electric motors are the simplest of mechanisms—strongly made—no small parts to get out of order. Reliability of operation is assured the owner of a G-E motor. It is made to deliver power every hour in the day, and every day in the year if necessary—it can be switched off and on a mile away.

If you are not using it now you'll soon decide to use electric power on your ranch—but before you decide send for our free illustrated booklets about Ranching by Electricity.

Peerless Fish Meal

Are You Interested In Poultry?

If so, we have something interesting to tell you. We have just closed a contract with two of the largest dealers in Petaluma for 500 tons of PEERLESS FISH MEAL, to be shipped them between now and May 1st, 1915. Why? Because it is the greatest Egg producer for the money in the world.

PEERLESS FISH MEAL is made from the dark meat of the tuna taken daily from the canneries; it is immediately cooked, the oil removed, and steam dried. This process makes it the sweetest, purest, and best meat food available, and we absolutely guarantee it not to flavor either the meat or the eggs.

The Bull Tractor $495.00

(*F. O. B. Pacific Coast Points*)

What the Bull Tractor Is

A three-wheeled machine; two in a hard smooth furrow, and one on the stubble.

One of the furrow wheels guides the machine when plowing, relieving the engineer of that responsibility.

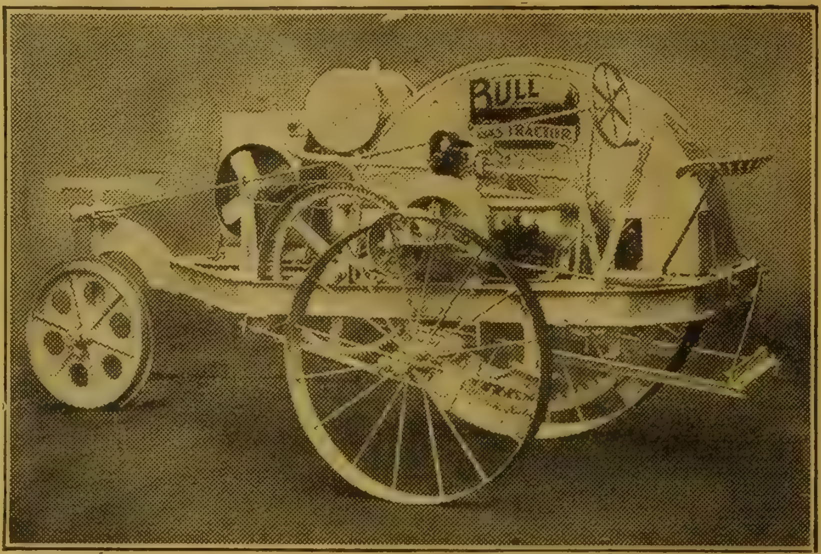
Has a leveling device by which operator can readily level tractor when on side hills.

Has but five working gears. One of these is a roller pinion.

Has but one drive wheel, thus eliminating equalizing gears.

Has but one main drive gear, which will last during the life of the tractor.

The motor is two-cylinder, four-cycle, water cooled type, and no better motor on the market today.



What the Bull Tractor Does

Delivers 12 h. p. at the belt, 5 h. p. at the drawbar, and is designed to do the daily work of 4 or 5 ordinary horses when properly operated under favorable conditions.

Travels somewhat faster than horses, and continuously.

Never gets tired.

Costs nothing for harnesses.

Costs one-half as much for gasoline as for horse feed, and does not eat when it does not work. Gets your work done in time. It is no longer a question of expense only in doing your farm work, but it is a question of getting it done.

Pulls Plows, Seeders, Harvesters, Mowers, Drills, Discs, and then grinds feed, saws wood, or does any stationary belt work on the farm.

Call or write and arrange for demonstration to see this wonderful tractor in actual service.
Full information and particulars cheerfully given. Good territory open for live agents. Write or wire Dept C.

Light Running Stag Sulky and Gang

No other plow is so simple, so rigid, or has such great strength in proportion to weight.

There is not an unnecessary piece of material used in the **Stag Plow**—examine the picture.

There are no fancy fixings—nothing that adds extra joints, journals or movable parts to get loose, give trouble and wear out.

From the farmer's standpoint the **Stag** is the

Most Plow for the Money

The **Stag** can be used with or without a pole. Horses control the plow just as well without a pole, because the two furrow-wheels are connected by a rod and then a rod extends to the clevis.

Width of furrow-cut can be changed instantly by the landing lever, which is within easy reach of the operator from the seat.

The Gold Medal Line.

Highest award at every World's Fair or Exposition since 1840

CALIFORNIA CULTIVATOR

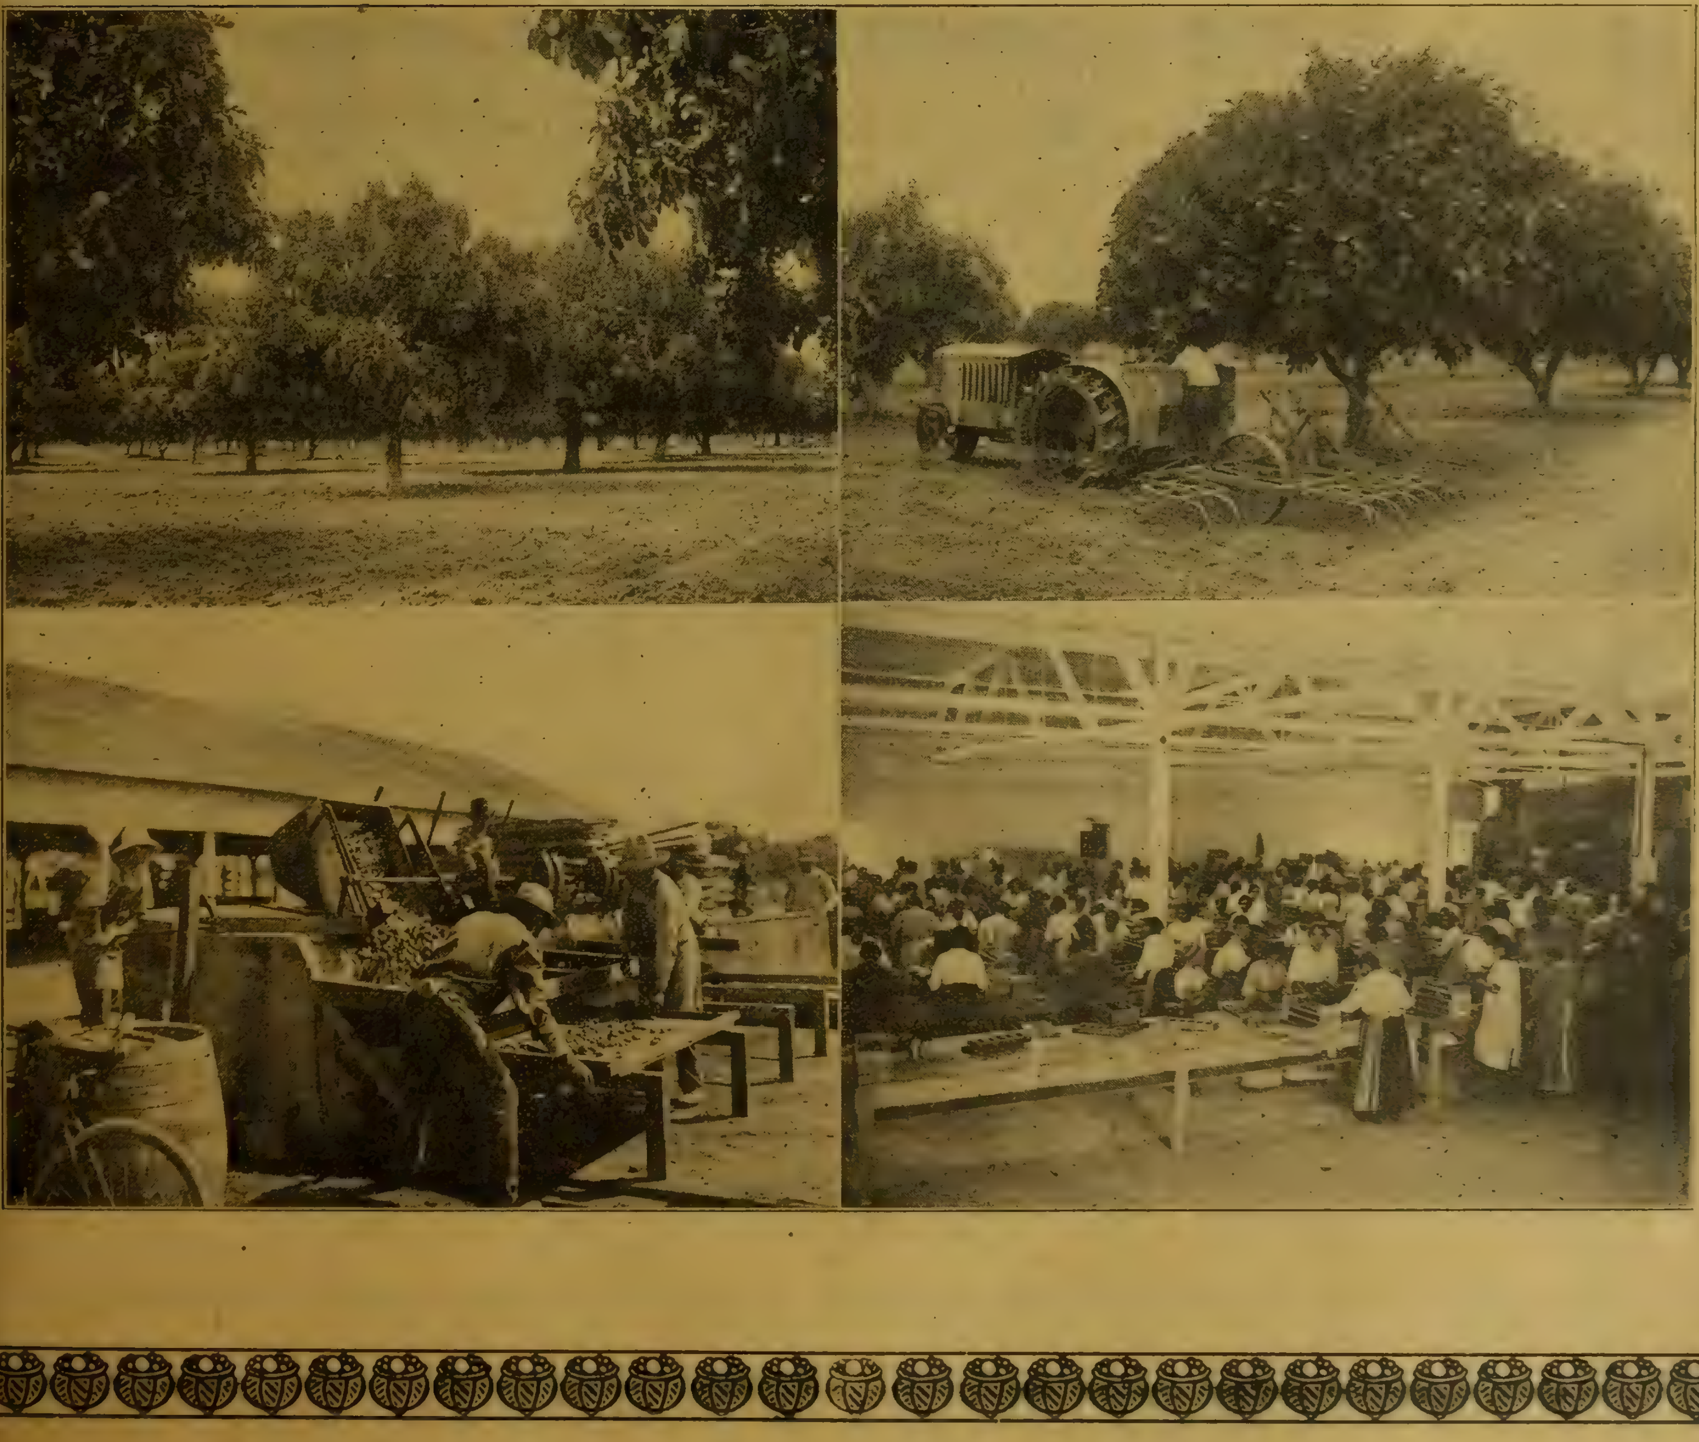
Rural Californian combined with California Cultivator

An Illustrated Weekly Magazine, Devoted to the Rural Home and Ranch

LOS ANGELES November 12, 1914 SAN FRANCISCO

Fig Industry in California Rapidly Becoming of Greatest Importance

Upper Left, Old Orchard of Adriatics; Upper Right, Orchard Tractor in Calimyrna Fig Orchard of Henry Markarian, at Fresno. Lower Left, Fig Washing Machine, Roeding Place, Fresno; Lower Right, Fig Packing Scene in Roeding Fig Company's House, Fresno



For Sale—40 acres, 1½ miles from station on Soutrern Pacific railroad. Clean, level land—good soil—ready for immediate crop. $150.00 per acre. This price includes pumping plant, trees, seed and farm implements.

Forty Acre Special

Every alert business man knows that the **WAR IN EUROPE** will cause a great demand on American farmers, to help supply the shortage of food products. **EVERY MAN** who is interested in farming should take advantage of this situation.

We Offer You the Opportunity

Every man intends some day to own a piece of country land. Now is the time to get it and turn wheat, rice, beans, corn and other immediate crops into money, and plant trees for a permanent future.

Our Land is Capable of Abundant Production

We are combining the water, seed, trees, implements, etc., with the land in such a way that any man who wants a farm finds his best opportunity here.

Forty Acres is Large Enough

and the income from it is sufficient for a good living and a permanent saving. It can be cultivated by one team and a set of implements and irrigated from a single well. We offer good land—San Joaquin Loam—in the Sacramento Valley, near the eastern foothills in the **TRUE THERMAL BELT**.

THE PRICE—$150.00 per acre (¼ cash, balance to be arranged) includes with the land

A MODERN PUMPING PLANT, completely equipped and installed: Water when you **NEED IT**.

TREES—A selection of almond, apricots, peaches, prunes, figs. Olive, lemon, orange and walnut trees for planting along roadways.

SEED—A selection of corn, beans, milo, alfalfa, rice and grain.

FARM IMPLEMENTS—A plow, a harrow and a cultivator.

THIS COMPLETELY EQUIPPED FARM places every buyer in a position to begin immediately and assures success from the start. Farming is the **GREATEST AMERICAN INDUSTRY** and today sceientific farming offers supreme business opportunities.

REMEMBER THAT NOW—November and December—are the months to prepare the land for a full crop next year. We advise in planting, and supply seed and trees best suited to the land.

Send this paper to any friend whom you think may be interested in such an opportunity. We will send a three months' subscription to The California Cultivator, without charge, to any one in the East who is interested in owning a California farm.

Write for further particulars of this inviting opportunity to establish yourself on a profitable and fully equipped farm.

Vol. XLIII No. 20 LOS ANGELES: THURSDAY, NOVEMBER 12, 1914 One Dollar Yearly

The Fresno Fig Industry

Dr. J. Eliot Coit Visits Fresno and Writes for Cultivator Readers Regarding the Handling of the Fruit, Methods of Cultivation, Best Varieties and Many Other Most Interesting Points Regarding the Industry. See Photos on Cover Page

DURING the early part of September the writer spent some time in the vicinity of Fresno studying the methods now used in harvesting and packing figs. The most noticeable thing this year is the air of cheerfulness which pervades the place. This is accounted for by the fact that the two great desiderata, a bumper crop and high prices, coincide this year. Everywhere, whether in orchard form or in rows bounding the vineyards, the trees are loaded. Fig trees are rarely propped, but this year thousands of props are in evidence and many of the splendid border trees have been badly broken by the weight of fruit.

The Calimyrna crop is of splendid quality but not extra large. This is due to the scarcity of caprifigs which was quite general over the state this year. Last spring the caprifigs failed for the first time in California, and this was due to the very unusual weather conditions which caused the mamme crop to mature far ahead of time. This warm spell was followed by cool cloudy weather which retarded the appearance of the profichi crop until most of the insects which had issued from the mamme crop had perished. As a result only a small part of the profichi crop contained insects. If the new Abyssinian caprifig had been more generally planted throughout the region this unfortunate situation would probably not have occurred.

Calimyrna figs in the fresh condition are in strong demand in the markets of the bay cities. They are carefully cut by hand from the trees when fully ripe and packed in shallow boxes, one layer deep with a strip of stiff paper between each two rows. Some shippers place under the figs a thin layer of wood wool of fine soft quality. The Mission figs are less tender than Smyrnas and are packed two layers deep with the stems nested. The shipping season for fresh Smyrna figs is from the middle of August till the latter part of October. It is possible that by the use of the Abyssinian caprifig, the first or breba crop of Smyrnas, now always lost on account of lack of insects, may be caprified and extra large fresh figs matured as early as the first of July at which time they should bring a fancy price.

While fresh figs may be grown throughout the southern part of the United States, the dried fig industry requires a hot dry climate and an entire absence of rain during the ripening season. If rain falls on the ripe figs they ferment and are a total loss. For this reason California is the only state in the Union which can produce dried figs. To be sure figs grow and produce well in Arizona and northern Sonora, but there a large green beetle known as the "fig-eater" (Alhorina mutabilis) ruins practically all the figs as fast as they ripen during the four or five weeks when the insect is in the perfect stage. This insect has never entered California but if it should be introduced into the great valleys it is saddening to think what would happen to the fig and peach business there. The insect spends its larval stage as a large white grub in the soil around old alfalfa stacks and cattle pens.

The dried fig business owes its existence also to the fact that the neck of the ripening fig remains firmly attached to the tree until the fig is tough enough to strike the ground without smashing. The tenacity with which a ripening fig holds on to the tree, no matter how limp the neck, is remarkable. This is the reason that fresh figs must be cut rather than pulled.

Contrary to the general impression, a few of the breba or first crop Calimyrna figs although not caprificated will persist and grow to sufficient size to be worth picking up dried for sale. They have a very different appearance from the caprificated figs and are of course much inferior as the seeds are mere empty shells. Most of the breba crop falls while quite small and worthless and the reason for the persistence of a few has not been explained.

Dried figs are picked up from under the trees once a week but Calimyrnas should be gathered every third day toward the end of the season when the danger of showers is greater. It is poor policy to shake the trees before the middle of September as the green figs may be injured.

Some growers dry the figs by spreadind them out on trays in the sun for a few days. Others stack the trays with air spaces between and thus dry the figs in the shade. Formerly the figs were washed in hot water to remove adhering sand but now cold water to which has been added five per cent of salt and one-fourth of one per cent baking soda is being used. The objection to the hot water was that it dissolved too much of the sugar. After washing the figs are again dried and sorted. All sour and bird-pecked figs are culled out and sold for manufacturing purposes.

All varieties of figs are not sulphured. The Mission, being black, probably could not be improved in color by any amount of sulphuring. The Smyrna fig is such a beautiful golden color naturally that it needs no sulphuring, but the Adriatic is usually subjected to the fumes of sulphur for the purpose of lightening the color, softening the skin and disinfecting the fruit from the germs of decay.

After the figs are packed down in the sweat-boxes they go through a process of equalization. They really do not actually "sweat" but the overmoist figs give up a part of their moisture to those which become too dry and hard before being picked up. While in the sweat-boxes the figs are hauled to the packing houses where they are later run through a sizing machine and afterwards dipped in boiling water to kill any insect eggs which may have been laid upon them, soften the skins for packing, and increase the weight from six to ten per cent.

Packing is done mostly by women who split each fig for the purpose of making the cheeks spread better and in order to detect and discard any figs which may have the black smutty fungus in the center. Part of the finest grade of Smyrna figs are not split but are "pulled" between the fingers until the meat which is located largely in the stem end is forced down under the eye. This pulling also softens the skin and improves the appearance.

Inasmuch as the packing of figs does not require a very expensive equipment some of the smaller growers are packing their own figs in five pound boxes, one pound cartons, and eight ounce bricks. Some have been very successful as they not only get the increase in weight on account of the dipping but a better price is secured. The parcel post is proving a great boon to these small growers who were before under a handicap in marketing their fruit. It would seem that the logical outcome would be a cooperative association with a common packing house. By affiilating with some of the larger fruit exchanges the marketing problem would be less acute.

There has been a good deal of complaint about figs in cartons becoming infested with worms and flour mites before they are sold. As the figs are sterilized just before packing it is only necessary to protect them from the egg laying of the dried fruit moth. Great care should be used in wrapping the wax paper about the bricks of figs. If the slightest crack is left the insects are apt to get in.

In regard to varieties there is much difference of opinion. The Mission is no longer being planted for drying. The discussion is between the Smyrna and Adriatic. The packers with some exceptions lean strongly to the Adriatic but those growers who have had experience with the Smyrna are much pleased with it and much new acreage is being put out. The Smyrna bears earlier and is highly resistant to nematodes and sunburn and sells for a higher price. On the other hand it has to be caprified and the tonnage is less than with the Adriatic. It appears that Smyrnas do better in orchard form than as border plantings, and the introduction of the Abyssinian caprifig may increase the tonnage. All things considered it appears that the Adriatic is most profitable when planted as a border and on land where the water table is never less than five feet from the surface during the ripening season. Where a grower plants in orchard form and especially if he intends to pack his own fruit the Smyrna is surely the most desirable.

On account of the present disorganized condition of ocean transportation the usual annual importation into the United States of approximately $1,000,000 worth of Smyrna figs from Turkey is somewhat problematical. In the event that Turkey goes to war this country may be forced to get along with the California figs. This would be a good opportunity for California growers to push their goods in the eastern states. They should make good use of this opportunity, if it comes, by limiting their eastern shipments to those brands which are sure to create a steady demand for more.

45th State Fruit Growers Convention

Representative Gathering from All Parts of California and Many Parts of the East

J. H. Hale, the peach king of Connecticut, Georgia and some other states; Eugene Grubb, the potato king of Colorado, California and some parts of Europe, and fruit growing kings of all kinds from all over California are making the old Normal auditorium in Los Angeles the fruit growers' Mecca this week. Many have come to teach, more to learn—all to learn in fact. But the cordial greetings in hotel lobby and on the street go to show that the social side is even more keenly enjoyed than the practical.

It's a practical convention, however. Men and women are asking to know. Men are planning large for the fruit industry.

Will there be a great association of fruit growers which will be used to make an even greater fruit-growing state? Will legislation be decided upon which will give greater recognition and encouragement to the industry? "Our reputation is world-wide; let us make it wider," is the prevailing thought. Incidentally, "How can we secure more profit?" Many questions will be decided before these words are read.

The exhibit is one of the most educational features. Los Angeles and San Francisco merchants are competing for popular approval of all kinds of orchard appliances, tools and implements. The exhibits are attracting much attention, but those outside the building are suffering a bit of competition in the weather. Dr. Carpenter, the weather man, was given one of the first places on the program, and this should have appeased Jupiter, but it surely had the reverse effect.

The committee has labored for nearly six months in sunny California days for the success of this convention, only to hear the patter of the season's first rain on the opening morning.

We're enjoying the rain, but the crowds are not crowded.

COVER CROPS

Fenugreek
Melilotus
Burr
Clover
Vetches

produce humus and nitrogen in the soil — the two big essentials in groves and orchards. From our studies of the needs of the citrus belt this year, we are strongly recommending the following:
FENUGREEK: is a rank and rapid grower, producing successfully on poor soils.
MELILOTUS INDICA and **BURR CLOVER** are also adapted to heavy and poor soils as they produce a deep and heavy root system resulting in the breaking up and in the porosity of the soil.
VETCHES: We are headquarters for imported and Oregon vetch.
We cannot too strongly advocate the inoculation of seed for best results. Hundreds of our patrons testify that the use of

FARMOGERM

300%
Crops

has increased their crops from 200 to 300%, thus giving more humus for the soil and more nitrogen -- gathered from the air by the nitrogen gathering bacteria and deposited in the soil through the nodules they form. The cost—less than $2.00 per acre. For booklet on *Farmogerm*, advice on Cover Crops and Prices, write to Dept. C

Citrus and Tropical Fruits

SOIL HYGIENE

Extracts from address by Dr. G. E. Bailey before 45th State Fruit Growers' Convention:

OUR soils, the one permanent asset of our nation, should no longer be considered as mere dirt under our feet, but as something to be studied, admired and cared for with intelligence, respect and love. If this were the case we would hear very little about "wornout" soils and "unfertile" soils, and there would be no need of calling attention to soil hygiene.

Soil hygiene is the system of principles or rules for the preservation of the physical condition of the soil, in order that the roots may find a congenial, sanitary home, and always be in a vigorous condition of health. It is not possible for the soil to do its part, for seeds to sprout, for trees to root well, and for crops to grow vigorously and yield abundantly, unless all the physical conditions are right.

A chemical analysis showing that the necessary plant food is present is not enough. That is only one of the conditions which must be balanced with a number of other conditions.

Water

Plants get thirsty. In fact, they are all hard drinkers. From 60 to 90 per cent of the weight of a plant is formed from water, and from 200 to 500 pounds of water are transpired for each pound of dry plant produced. A six-foot high sunflower will evaporate a quart of water in one warm day. A walnut tree will breathe out 5000 gallons of water in a month. It is not enough that a reservoir of water has been stored in the soil. The physical condition of the soil must also be right. There must be capillary action. The pores of the soil must be open. A soil will not make a home for vigorous root growth when its pores are clogged and its drainage system checked, and you cannot remedy this condition by chemical analysis or by dosing it with the most powerful or expensive chemicals. The stored waters must be able to rise and move freely in every direction to maintain the film water. The tiny feeding roots must be able to go in every direction in their search for the films of water that cling to the soil particles.

Too much water and the shutting off of the air is as fatal to plants as it is to animals. Too much water makes the soil cold and wet when it should be warm and moist. Do not scald the roots by poor methods of surface irrigation. Do not plant crops between the trees too close to the trees or one or the other will be robbed of its share of the life giving waters.

Air

Soils must breathe. It is just as necessary that air should penetrate the soil and circulate through it as that it should circulate through the rooms of our homes and penetrate our lungs. There must be air-spaces in the soil. It must be porous so that the soil atmosphere may not only circulate around the roots but be replaced from time to time. The carbon dioxide of the soil atmosphere absorbed in the soil solution is the principal solvent of the mineral plant food. If the access of air into the soil is prevented by compactness, water logging, swamp conditions, slime or sewage, then the plant wastes away and dies. The work of the bacteria is checked even to the extent of denitrification taking place. Deep cultivation of the soil does what Virgil advised,—it "Distends the crevices, and makes new breathings, when new nourishment she takes."

Food

Fruits are humble, plain, every-day livers. While hundreds of minerals are known to science only a few are demanded as plant food. Water, nitrogen, potash and phosphorous are the coffee, meat, potatoes and bread of the plant world. A little mysteriously concocted, high priced, ammoniated, double super-phosphated fertilizer may serve as a tabasco sauuce for some of the high livers among the fruits, but the stock supply of the staples found in every soil is sufficient for nearly every plant, tree or flower.

A good shaking up of the soil, more air and good water will often do more to improve the digestion of the plants than anything else. Fertilizers are not to be abandoned—by no means. They will and should be used more and more, only let us know what we use them for. Let us try and realize that their use is more often to improve the physical condition of the soil than to add food.

Bacteria

The soil teems with myriads of organisms and hums with the activities of many forms of miscroscopic life, with good, bad and indifferent bacteria. They are so small that 1500 could rest together comfortably on the head of a pin. They are so big, so important in agriculture, that huge volumes have been written about them.

Cultivate the soil deep and stimulate into activity the bacterial life that lies dormant in every soil.

Promote especially the activity of the nitrogen producing bacteria. There are about 75,000,000 pounds of inert atmospheric nitrogen piled up above avery acre of land. Why not open the soil and let some of it sink down a few feet and let the bacteria do the rest. But how can they fix the nitrogen of the air if the air cannot penetrate the soil? Why confine nitrification to the furrow slice? The deeper the cultivation the deeper the bacterial activity.

Feeding Zone

The feeding zone of the soil must be deep rather than broad. Crops are

Olive Trees

Olives worked on Picholine Root have stronger growing and deeper feeding root systems than those grown from cuttings.
Our Olives are worked on Picholine Seedlings, the wood being cut from trees having a record for productiveness and size of fruit.

The Old Reliable

San Dimas Citrus Nurseries

Established 1890
Incorporated 1913

Citrus Trees Exclusively

All Leading Varieties

REMEMBER, MR. PLANTER

Practically anybody can grow a citrus tree, but it takes years of experience to produce a tree that will prove a money-maker when it comes into bearing. Nice-appearing nursery trees are desirable and promising, but do not always prove to be good bearing trees in the long run. Plant for profit and not for appearance only. Our trees are straight, thrifty, well rooted and have strong, full heads, but the main consideration is that: Our buds are carefully selected from heavy fruiting trees and will prove true-to-name revenue producers.

OUR TWENTY-FOUR YEARS

of experience in the growing and handling of citrus nursery trees gives the buyer the advantage of starting out RIGHT, thus avoiding disappointment at the end of four or five years' labor in bringing the young orchard into bearing.

ANOTHER POINT TO CONSIDER

Growing a good tree is only part of having it do well after planting. Many a good tree is ruined in the taking up from the nursery and shipping. We give the best of service in the proper handling and delivering of our trees.

WRITE,

'phone or call on us before buying your trees. Tell us your wants and we shall be glad to give you the benefit of our wide experience as to planting, soil conditions, fertilizers, etc.

Our illustrated new booklet on citrus culture mailed to any address upon receipt of 25 cents.

QUOTATIONS
GLADLY
GIVEN

San Dimas Citrus Nurseries

(INCORPORATED)

Established in 1890 by R. M. Teague

San Dimas
California
U. S. A.

Teague trees are started right, grown right, and shipped right.

small where the feeding zone is shallow or meager. They must not only go down, but we must follow them down in cultivating the soil. The roots go down 5, 10, 20, 30 feet, and the tiller of the soil must not stop with 5, 10 or even 20 inches. It is not enough to scratch, one must dig. To simply scratch the surface is like trying to cure a child who is sick all through his system by combing his hair, or scratching his back.

The size and extent of the root system is generally overlooked, yet it is comparable to the size of all that is above ground. Wheat, oat and barley roots go 8 and 10 feet down; grasses, 5 and 6; grapes, 20; alfalfa, 30 and more.

Sanitation

Wherever there is action there is reaction. All life processes cause destruction of tissue, cells, or other forms of matter. Plants not only secrete food from the soil but excrete the excess, the used or waste material, and these toxins must be neutralized or destroyed in the soil. Certain forms of bacteria act as scavengers, clearing the soil of toxins and dead organic matter, but they cannot do their work unless the soil atmosphere, soil temperature and soil moisture conditions are right. The bacteria of some crops thrive on the toxins left by others, hence the value of crop rotation.

Tools

It must be admitted that our present means of cultivation are not up to date because they do not go down deep enough. They cultivate the surface a few inches while the soil should be stirred to a depth of several feet. If this wealth of invention and labor is worth while for the first foot, why not for the second, third, fourth, eighth or tenth?

Cultivating Deep

It is evident that any machine which must drag and bury any portion of itself deep in the soil will be heavy and expensive. The quickest way and the cheapest way yet invented to plow deep, to give proper aeration, proper moisture conditions and break up the soil so that the roots may go down 5 or even 15 or 20 feet, is by the use of explosives. They break up the hardpan, hard subsoils and improve the physical conditions of the soil to any desired depth. The great drawback has been the danger connected with their transportation, storage and use. Now manufacturers are realizing this and making brands which are safe for farm use.

Finally

Look down as well as up. The horticulturalist works cheerfully, long and hard where he can see with his eyes what he is doing. We must learn to cultivate the inner vision and to look mentally below the surface into the depths of the soil.

"EASY SCALE KILLER"

From Mr. M. E. Taylor of Ceres we have received the following comment on article appearing under the above head on Page 414 of the California Cultivator of October 29:

In your article in the Cultivator of October 29, entitled "Easy Scale Killer," you say that the Los Angeles county horticultural commission tried the method out some years ago and found the poison in the tree unabsorbed after being there for a year. Surely they could not have used potassium cyanide or they did not place it in contact with the sap of the tree. Arsenic or strychnine might remain unabsorbed for some time but potassium cyanide would disappear very quickly. Would it not be well to try it on the olive scale? The poison would be dissolved in the water in the process of pickling or oil extraction if it were taken up by the fruit. Prof. Sanford is too astute an experimenter to be easily deceived.

LOST.

The mistress of the house had mislaid her eyeglasses. She asked the old negro servant if she had seen them.

"No'm, honey," said Aunt Missouri, "I ain't seen 'em. But I'll fin' 'em fo' you. Jest tell me now was dey in de shell?"—New York Post.

About Increasing Orchard Profits

THE object of every business is to make money. If fruit growing is your business, you can only increase your profits by producing *more* and *better* Fruit, which means planting More and Better Trees.

Buying Cheap Trees is False Economy

When planting trees, *know* they are profit-makers. Don't be satisfied with *just* trees, or even *good* trees—plant our *prize winners*. They cost *no more* and *must be better*, otherwise they could not have won first prize in competition with California's best stock.

Gold Medal trees mean Gold Dollar profits for you—plant them this year and take the first step toward increasing your orchard profits.

The First Prize and Gold Medal was awarded our Fruit, Nut and Olive Trees and Grape Vines at the 1914 State Exposition.

A catalog of the best varieties of Fruit and Nut Trees and valuable Horticulture Data is yours for the asking.

Roeding's True TREES

TAKE THE RISK OUT OF PLANTING

All our stock is guaranteed true to name and packed so as to reach you in first-class condition. Roeding's trees grow and produce profitable crops.

We have over 2000 acres devoted to growing all the leading varieties of apples, pears, peaches, plums, prunes, apricots, walnuts, olives, almonds, oranges, lemons, pomelos, grapes, berries, etc.

BEFORE placing an order for trees, vines or ornamental stock, you should be thoroughly posted as to what is most adapted to your soil and locality—and what will be likely to bring you the largest profits or possible results.

Of course you know about what you wish to set out, and you have undoubtedly given a great deal of thought to your future orchard—but if you can secure the advice and counsel of those who have had over 30 years' experience in growing, packing and marketing products of trees and vines in your state—if you can get this advice and help FREE, isn't it to your interest to do so?

No Charge for Consultation

We have helped thousands of growers and will be glad to help you. Write us frankly about your plans. Tell us frankly what you propose setting out and we will advise with you without any obligation on your part.

Ground Limestone
for
Agricultural Purposes

WESTERN ROCK PRODUCTS COMPANY · SAN FRANCISCO · WESROCK QUALITY

Get the greatest production from your land by the proper application of lime.

The benefits of liming are due to its chemical, physical and biological effects upon the soil.

Chemical effects — Makes "sour" soils "sweet" by changing an acid soil condition to a slightly alkaline one. Acidity in soils is very detrimental to the growth of anything, while a slightly akaline condition is ideal. Adds to the supply of the three most essential plant foods; nitrogen, potash and phosphoric acid.

Physical effects—Makes clays and clay adobe soils looser, prevents their packing, baking and cracking, makes plowing and cultivating easier, and, in general, makes the soil a healthier medium for plant growth.

Biological effects—Favors the growth of useful and beneficial bacteria and other micro-organisms of the soil, especially those which live in the nodules on the roots of alfalfa, vetch, peas, beans and other leguminous crops.

Lime builds up the soil, restores impoverished lands and because our lime is not caustic it may be used in almost any quantity at any time. We recommend applying about one ton to the acre for beneficial results.

Nearly all lime used, no matter in what form, is prepared directly or indirectly, from deposits of calcium carbonate, chief of which is limerock, from which our ground limestone is made.

Our ground limestone for fertilizing is made of the purest quality of limerock obtainable, is an honest material, honestly prepared and ground to that degree of fineness recommended by the Agricultural Department of the University of California as rendering the greatest efficiency.

You can get immediate deliveries from us either in bulk or packed in 100 lb. sacks. Write us for further information, prices, etc.

WESTERN ROCK PRODUCTS CO.
Balboa Bldg., San Francisco

THE RIGHT KIND OF LIMESTONE

California soils have usually been considered well supplied with lime. However, practical experiments have proven that often they are greatly benefited by its judicious application. As a rule air slacked lime or sugar lime have been employed. Finely crushed lime rock is often recommended. A fund of information is given in an article appearing in a recent number of the Country Gentleman, from which we quote:

"It is difficult to estimate by simple inspection of a sample how finely limestone is pulverized. The dust covers and obscures the coarser chunks, so that the whole mass of material appears to be finer than it really is.

"In order to determine exactly the proportion of the various-sized particles in an average lot of screenings, and also of finely ground limestone, 100-gram samples of each were weighed out and screened through a nest of three sieves—the top one having ten meshes to the linear inch, the second forty meshes to the linear inch and the third one hundred meshes to the linear inch. The results of the experiment were as follows:

	Pct. ¼-In. Screenings.	Pct. Fine Limestone.
On 10-mesh sieve	39.5	0.3
On 40-mesh sieve	46.0	36.0
On 100-mesh sieve	9.5	34.3
Through 100-mesh sieve	5.0	29.4

Material Must Contain Dust

"The bad effects of soil acidity are so pronounced and the good effects of lime in such cases so profound that eminent authorities have said that an adequate supply of lime carbonate is the very foundation of soil fertility and successful agriculture. An adequate supply of lime carbonate means lime enough not only to neutralize all soil acidity but to give a slightly alkaline reaction. A limestone monument a mile high in the corner of a field is not an adequate supply of limestone so far as that field is concerned, neither is a quantity of small chunks of limestone artificially scattered over the field. In liming the soil the question of solubility must be considered.

"Only the comparatively small particles of limestone go into solution readily enough to produce immediate results. The material used must, therefore, contain enough dust to produce the desired result. Residual coarser particles will doubtless do some good, but they cannot be counted upon for immediate effects.

"A soil that is acid enough to require 1,000 pounds of carbonate of lime to neutralize the plowed surface of one acre—and this is not an extreme case by any means—must have at least 1,000 pounds an acre of fine limestone dust to render it even neutral, and a larger amount to render it basic in reaction and really suitable for the growth of legumes. It is generally believed that chemical methods underestimate the real acidity of the soil and that more lime must be applied than is indicated. In the above instance, however, it is evident that about 1,600 pounds of the limestone dust or about 7,000 pounds of the quarter-inch screenings would be required to supply the requisite amount of available lime. These estimates are based upon everything passing through the forty-mesh sieve. This, of course, is merely an empirical estimate, but it has the advantage of squaring up well with the results of field experience.

"Small applications of screenings are rarely satisfactory. The acidity of the soil is not neutralized, even though numerous small chunks of limestone remain in the soil: it is simply decreased somewhat. A case of this kind was encountered recently in Henry County, Indiana. A farmer plowed under two tons to the acre of limestone screenings, with no apparent good effects. Two years later it was easily possible to find small pieces of limestone at the bottoms of the furrows, but repeated tests showed that the soil where these particles lay was acid to litmus paper.

"In another case a farmer was advised by the experiment station to apply two tons to the acre of ground limestone. Not understanding the difference between limestone screenings and finely ground limestone, he applied the former and got no results.

GROW INOCULATED LEGUMES

Alfalfa, Clover, Vetch, Field Peas and Beans

Inoculate Forage, Cover and Green Manure Crops with

The Improved German Soil Inoculator, Nobbe-Hiltner Process
NITRAGIN
TRADE MARK REG'D DEC. 6, 1898 NO 32212
PURE CULTURE
THE SIMPLEST SAFEST AND SUREST SYSTEM OF SOIL INOCULATION FOR ALL LEGUMES

"NITRAGIN" is the wonderful germ that unites with the legume root and draws from the air the precious *nitrogen*—necessary to *all* plant life, health and growth.

Failure to get a stand or a perfect "catch" is nearly always due to the absence or weakness of the nitrogen-gathering germ. "NITRAGIN" Pure Culture gives to your legumes *billions* of these active, vigorous germs; as a result the plants grow quickly and luxuriantly; they are big, strong, healthy, deep-rooted.

A legume inoculated with "NITRAGIN" Pure Culture is the best *shade or cover crop* because of the quick growth, vigor and luxuriance of plant, and because it is a *soil-enricher* instead of a *soil-robber*. It is the best green manure crop because of the immense quantity of new nitrogen it adds to the soil and the extra richness of the humus.

"NITRAGIN" Pure Culture is the *original*—discovered by Nobbe and Hiltner, famous German bacteriologists; it has been improved and perfected by twenty years of testing and proving. It comes to you in *granular* form, packed in ventilated tin cans. Easy to apply—ten minutes work—a boy can do it.

Alfalfa—You can't afford to risk failure on this wonder crop. For Alfalfa success, inoculate the seed with "NITRAGIN."

"NITRAGIN" invariably insures a perfect "catch," quick growth, enormous yield and extra food value.

Inoculate *all* legumes with "NITRAGIN" Pure Culture. A special strain for each legume—27 varieties.

Pure Culture inoculation is endorsed by Government authorities, state experiment stations, practical farmers, agricultural experts and soil culturists. Let us send you testimonials and other *proof*.

Price: Garden size $1.00 per can; acre size $2 per can; 5-acre size $9 per can. F. O. B. Postage and express extra. Parcel Post, 10c per acre extra. Ask your seedsman or fertilizer dealer for "NITRAGIN."

Prepared in the Laboratories of the German-American "NITRAGIN" Company, Milwaukee, Wis.

Guaranteed and Distributed by **Armour Fertilizer Works** Los Angeles, California

Alfalfa Seed

It pays to be particular when you are purchasing.

All the stock we offer for sale has been grown on fields personally inspected by us before they were harvested

We do not grow, nor do we deal in any kind of seed—Our whole time and attention is devoted to the Alfalfa Seed Game.

We can, and do, offer California's best product.

Samples, prices and any information you may desire will be furnished on request.

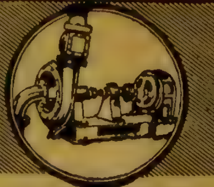
Irrigation Forestry



FALL IRRIGATION

Written for the California Cultivator
By Sacramento Valley Contributor

THERE are lessons we should learn every season. Now that the water is out of most of the irrigation ditches in the great interior valley, let us look back and see just what things we should have done that we did not.

Are there not a great many of us who could have used the last run of water to good advantage and we did not do it?

If any one ever lost by having his soil well filled with moisture at the beginning of the winter season we do not know of it, and any one who has lived in any of the irrigated sections of central California can recall at least one, and perhaps many, times when the rains we hoped would come did not arrive, and trees and alfalfa and other things got very, very dry before we had water in the ditches again.

Every farmer should have a diary for the succeeding year's work, on which to set down the things he should do, and some time in August, 1915, there should be an entry something like this: "Be sure to get everything on the place well irrigated before the water is turned off."

We believe that the tissues of every plant should be full and plump and well nourished all the time, and there is no time when this is more necessary than in the fall. There are many days of drying wind during September and October, and unless there is ample moisture in the soil to supply this to the plant it must come from the plant itself to the detriment of its growth for the present and succeeding season.

PROTECTION OF THE IMPERIAL

The Inland Waterways Association of California, at the semi-annual session held in Stockton, September 24, 25 and 26, unanimously adopted the following preamble and resolutions:

Whereas, the Imperial Valley is in constant danger from overflow waters of the Colorado River and has in the past been damaged seriously by overflows from this river, and is at all times menaced with the possibility of an overflow which will destroy or largely damage its irrigating systems and other property in the valley; and,

Whereas, the overflow waters leave the bed of the Colorado River in Mexican territory and flow thence into that part of the valley on the American side of the line; and,

Whereas, on account of this peculiar condition the regulation and prevention of the overflow of the Colorado river becomes a matter of national concern requiring the intervention of the United States and agreements between that government and the government of Mexico, and the same cannot be regulated or controlled by either local or state agencies.

Therefore, be it resolved, that we earnestly favor such action on the part of the United States government as will result in protecting the Imperial Valley and the $75,000,000 of wealth that the people of that valley have developed within recent years from the disastrous effects of the overflow of the Colorado river, and we recommend the immediate appropriation by the congress of the United States of a sufficient fund to establish such retaining levees and other works as will protect the Imperial Valley from the danger of overflow.

ALKALI IN IRRIGATION WATER

It is quite impossible to make an accurate general statement as to just what percentage of soluble salts, commonly called alkali, irrigation water may contain without being prohibitive for application to crops. Very little water indeed is too alkaline for irrigation under proper conditions. The permissible percentage of soluble salts depends not so much upon the quantity in the water as upon the kind of salts that are in solution, and the physical character of the soil to which it is to be applied. The one fundamental which should be observed is that any land to which very alkaline irrigation water is to be applied should have good drainage. A heavy, compact soil with poor underdrainage will be damaged by a comparatively small alkaline content of the irrigation water, while a sandy soil with a loose subsoil and good drainage would show no damage from irrigation water many times stronger in alkali.

Another fundamental is, at least where the land is inclined to be heavy, the alkali water should be applied to it in quite heavy irrigations. This excessive amount of water will have a tendency to prevent surface accumulation of salts and will wash the salts downward through the soil and away from the feeding zone of the plants. Light irrigations with such water would allow practically all of the water to evaporate from the ground surface with the result that virtually the total amount of alkali carried in the water would remain in the soil and accumulate with each successive irrigation until the danger point is reached.

Whenever water is considered to be dangerous for irrigation because it is alkaline, it is best to plant such crops as permit of the greatest flooding of the land, and those crops which are usually forage crops will not only stand, but require heavier flooding than other field crops.—V. M. Cone, Colorado Agricultural College.

QUITE DIFFERENT

Little Mary had been sent to the store by her mother to get some fly paper. She was a long time in returning, and the mother began to get anxious. Going to the door she spied the little girl coming up the street, and called to her, "Mary, have you got the fly paper?"

"No, mother," replied Mary, "it's got me; but we're coming together."

WHERE IGNORANCE IS BLISS

"Was that your intended that you were walking with?" "Yes, but he hasn't yet caught on."—Life.

A Tip on Almonds

On this continent Almonds are grown only in California. The American market alone demands *four times* the present supply.

With practically an unlimited home market and a monopoly of the product

Plant Almond Trees if you are seeking a real money-making investment.

We have an extra fine lot of trees growing on Bitter Almonds, Peach, and Myrobolan Root, but as there is usually a shortage of trees on Bitter Almond, place your contract immediately—don't delay.

RIGHT KIND OF LIMESTONE

(Continued from Page 463.)

Later be applied to another part of the field two tons to the acre of finely ground limestone, with the best of results. The sole reason for the failure of the screenings in both these cases lay in the small amount of fine dust applied and the comparatively slow solubility of the coarser particles.

"In the cases just cited the soils were rather closely grained silt loams with but little organic matter in them. Doubtless better results might be secured in the case of open, sandy soils, in which the limestone would dissolve somewhat more readily, but even in such cases it is better to use really adequate amounts.

"A large application of screenings will outlast a smaller application of finely ground limestone, but there is plenty of room for debate as to which is the more economical. Advantage may be claimed for the screenings in that a single application lasts longer and the same land does not have to be gone over again so soon, and that there is a larger excess of lime carbonate in the soil for a time after liming, which is very beneficial to certain crops. Furthermore, the first cost of material is much less.

"On the other hand, it must be borne in mind that the labor cost of handling the necessarily large amount of material is quite an item, particularly in the case of long hauls, and the excess of undecomposed lime carbonate in the soil is subject to heavy losses by leaching, so that a considerable amount of it leaches out without doing any good.

"Limestone applied in the presence of soil acidity combines with acids, but limestone that is lying in the soil waiting for acidity to develop may get washed away before any need of it arises. This condition makes it plainly unwise to apply any very large excess of the relatively soluble finely ground limestone, and throws some doubt on the advisability of liming with any kind of lime very much in advance of immediate needs of the soil.

"However, important as it may be to know something about the various kinds and grades of lime and limestone in order to get the desired results most economically, the main thing to bear in mind in the case of acid soils is that any kind of lime—burned lime, slaked lime, limestone screenings, limestone dust, marl or shells—is much better than no lime at all. Application of lime to soils deficient in it means fewer failures and bigger yields of clover, which, in turn, if wisely utilized, mean more nitrogen and organic matter in the soil and larger yields of all other crops in the rotation."

THE FERTILITY OF THE SOIL

The Fertility of the Soil by Edward J. Russell, D. Sc., Director of the Rothamsted Experiment Station, published by Cambridge University Press and G. P. Putnam's Sons, New York, price 40 cents. The Cultivator will be glad to secure the book for its subscribers at the above price or, including a year's subscription to the Cultivator, at $1.30.

The book is small enough to carry in the coat pocket and big enough to give a world of information regarding soil fertility. It contains nine chapters, with a bibliography and an excellent index. It discusses natural history of the soil, how plant food is made in the soil, what is fertility and how maintained, raising of the fertility limit, and many other most interesting topics.

"To those who have never thought about the matter the study of the soil may seem very trivial; it has neither the glory of the celestial nor the glamour of the unfamiliar; it is associated with such unintellectual and mundane concerns as food production, and has no place in our ordinary conception of a refined and liberal education."

It is said that the forest service contemplates a decided change in the present regulations governing the issue of permits in the Wichita, Washington, national forest. The plan provides for a 10 per cent reduction upon permits above the protective limit held by owners of improved ranches and a 20 per cent reduction upon permits above the protective limit, held by persons who do not own improved ranches in the vicinity of the range.

At Last!—a Real Tractor for EVERY farmer—

$495 COMPLETE

—at a Price That Makes Horses too Expensive to keep!

Big news for you farmers! Now you can have a tractor on your place—in fact, you can't afford to be without it. $495 buys the Bull Gas Tractor. Designed by men who have specialized in tractors for years. The Big Four "30" was their creation—now the sturdy "Bull" comes because these experienced men realized that there was a gigantic demand everywhere for a small tractor. After constant work they perfected the Bull Gas Tractor. They eliminated one of the big bull wheels and thus eliminated a lot of other expensive and heavy mechanism, such as in the frame, axle and differential gears. Every part of the "Bull" is easy to get at—you don't have to take the tractor all apart to repair some little piece of machinery.

The BULL TRACTOR

The "Bull" is a 3-wheeled machine—two in a hard, smooth furrow, one on the stubble. One of the furrow wheels guides the machine when plowing, relieving the driver of that responsibility. It has a leveling device by which the operator can readily level tractor when on side hills. Has but 5 working gears (think of it—only five). Has but one drive wheel, thus needs no equalizing gears. Has but one main drive gear, which will last during life of the tractor. Motor is two-cylinder, four cycle, water-cooled type—no better motor on the market today anywhere!

The Bull Tractor delivers 12 horsepower at the belt, 5 horsepower at the drawbar and is built to do the daily work of 5 ordinary horses. It travels faster than horses—and keeps right on going. Never gets tired. Costs nothing for harness. Costs one-half as much for gasoline as for horsefeed. Never eats when not working. Never gets sick. Gets your work done better, cheaper and on time. It's the best paying investment you could possibly put out on your place, whether you have 80 or 800 acres. The "Bull" is not only a tractor—it's an expert at everything! Here's what it does:—

Pulls Plows, Seeders, Harvesters, Mowers, Drills, Discs, Grinds Feed, Saws Wood. Does Any Stationary Belt Work.

Send for Free Booklet

Learn for yourself why hundreds of farmers all over the country are using The Bull Gas Tractor in place of horses.

READ THESE FEW LETTERS

Euclid, Minn., May 11th, 1914.

I have the "Bull" hard at work and it is pulling three bottoms in the stubble, and I believe it will haul four. I have had from fifty to one hundred visitors every day, and it proves to be one of the best tractors ever built.

JOHN BIEVER.

Bird Island, Minn., April 24, 1914.

The "Bull" is working finely. I pulled a six-horse road grader at an average speed of four miles an hour yesterday, and six horses can't average over three miles per hour at their best.

HEANEY & PALMLUND.

Hingham, Mont., June 10th, 1914.

The Tractor that we got is working every day, plowing from four to five acres per day and eight inches deep with a harow behind it, and does elegant work.

KIMPEL IMP. & HDWE. CO.

A FEW LIVE AGENTS WANTED WIRE OR WRITE

Doesn't this sound good to you, Mr. Farmer? Wouldn't you like to have one of these $495 Tractors on your farm? Haven't you waited for years for a tractor of small price, knowing that some day it must surely come? Every shrewd farmer has—and now the "Bull" offered at a price so low that no business-farmer is going to be without one! Certainly no farmer is going to keep and feed 5 hungry horses all the time when he can get the Bull Gas Tractor for $495.00. It seems perfectly logical and practical, doesn't it? Then write to us today for our illustrated booklet. It's free—we'll be glad to mail it to you. Address

Economics on the Farm

WARNING AGAINST CHEAP LOAN SCHEME

(This warning is sent out by the United States department of agriculture.)

SOME one recently remarked that it was astonishing how hard some men were willing to work in order to make a dishonest living. The field of rural credit is already producing a number of examples. Certain companies are actively at work promising farmers cheaper money than anybody else is able to get on equally good security. The eagerness with which some are accepting the bait is one indication of the need there is for a sound system of rural credit. It is not wholly the fault of the farmer who is taken in. A great deal of mental energy, combined with marvelous skill, is expended in preparing soul-compelling circulars which seem to promise the farmer everything, but really promise him nothing. If as much thought and skill were exercised in trying to convert sinners, we should be very near the millennium.

Stripped of verbiage and words which darken rather than enlighten, the scheme is essentially as follows: Such a company offers to lend you money on good security, at say, three per cent interest, and to allow you to repay the loan in easy monthly installments on the amortization plan. This sounds alluring, and, if you are not too persistent in asking what you are to get and when you are to get it, you sign an application for a loan on these favorable terms. In a few days you receive from such a company a contract for the loan for which you applied. The contract which you receive is duly signed by the officers of the company. Then you realize that the application signed by you and the contract signed by the officers of the company together constitute a valid contract, and that you are now in for it.

Under the terms of the contract you are to begin at once paying off the debt of, say, $1000 at the rate of $10 a month, but you have not got your $1000 yet. Moreover, you do not know just when you will get it. The only thing you know is that you have got to go right on paying $10 a month. You have, however, the promise that whenever the company has the money to spare, you will get your loan. Another way of saying the same thing is that when your turn comes, you will get it. This means that such a company has not the money now, and that there are several other gentlemen whose turns come before yours. As fast as the company gets money it lends it out to these men each in his turn. When your turn comes, if the company lasts that long, you will get your money.

Now, where does this kind of company get the money which it is going to lend to you and the other gentlemen who have signed these contracts? Why, it gets it from you and those same gentlemen, and from no one else. Speaking to all of you collectively, it says, in effect, "Gentlemen, this company has no money of its own, but if you will pay your money into its treasury, we will then be glad to lend it back to you, if you will give good security, on very favorable terms indeed."

If such a company ceased getting new contracts, it could not lend you your thousand dollars until you had paid in a thousand. It has no other source of income, and it cannot create something out of nothing. If it continues to get new contracts after yours, then it can take the money paid in by those who follow you to lend to those who precede you. In this way your turn may come before you have paid in quite the full amount which you expect to borrow. But those who follow you will have to wait still longer on that account. If new applicants should sign up rapidly and in large numbers and begin paying their good money into the company, the company may then be able to give you your loan tolerably early. But that only postpones the evil day. Those who follow you in such numbers will have to wait longer and longer unless the applicants should continue increasing in a geometrical ratio. But the longer this sort of thing goes on the greater will be the smash when it comes.

Unless you have been initiated into the mysteries of geometrical progression you may imagine that this sort of thing can go on indefinitely; but if you will take your lead pencil and figure a while you will find that in order that you may get your loan within a year there must be about 10 times as many applicants next year as there were this. In order that they may get their loans within a year, there must be 10 times as many applicants the following year as next year, and so on indefinitely. Now, if there are 1000 applicants waiting for loans this year, in 10 years there would have to be, at this rate, 10,000,000,000,000 new contracts in the tenth year. This is nearly 7000 times the present population of the earth.

But if you and all the applicants are willing to wait five years for your loans it would only take 1,024,000 new contracts in the tenth year to keep the company going. By the thirteenth year there would have to be 8,192,000 new applications. There are about

6,500,000 farms in the United States. If there were several companies like this operating on our farmers, you can see that the competition among them would, by that time, become what might be called severe.

But why mince matters? Everyone who has ever studied the question knows perfectly well that this sort of business is foredoomed to failure. There are only two possible conditions under which it can possibly last, and both these conditions assume a degree of foolishness on the part of the American farmer of which even his worst enemy would not accuse him. One is that he will be willing, in considerable numbers, to continue paying his monthly installments into the treasury of the company until he has actually paid in as much as he expects to borrow back. A savings bank would be better, because it will allow him interest on what he pays in, and when he draws out what he has paid in, he does not have to pay any interest, not even three per cent. The other is that so many of those who begin paying in their monthly installments will get tired of their bargain and quit, as to enable the company to take their money and make loans to the few who stick to it. If nine out of every ten who pay in money stop before they get their loans, the company may then make its loans within a reasonable time to the troublesome one who sticks to them. Under no other condition whatever can such a company last many years. One can predict its failure with the same certainty that one can predict the death of a human being. In neither case can one predict the day and hour, but that the event itself will occur within a nameable period is absolutely certain.

If, instead of paying $10 a month into the treasury of one of these companies, one were to deposit $10 a month in a savings bank, which would allow him interest month by month on all his deposits, the following table shows what he would have to his credit at the end of each year. The first column shows what he would have to his credit in a savings bank that allowed him three per cent; the second column shows what he would have to his credit in a savings bank that allowed him four per cent. It will be noticed that in either case, by the end of the fourth year, he would have to his credit more than $500:

End of—	3 per cent	4 per cent
First year	$121.95	$122.60
Second year	247.56	250.10
Third year	376.94	382.70
Fourth year	510.20	520.61
Fifth year	647.46	664.03
Sixth year	788.83	813.19
Seventh year	934.44	968.32
Eighth year	1084.42	1129.65
Ninth year	1238.90	1297.44
Tenth year	1398.02	1471.94
Eleventh year	1561.92	1653.42

EXPERIMENTS WITH TEPARY BEAN

The tepary bean is proving a wealth maker for some of the hotter desert sections of the Southwest. It has been proven out and selected for hundreds of years by the Indians and perhaps by prehistoric tribes. We are glad to give the following, by Mr. Geo. C. Clements, touching upon conditions in Riverside County:

I desire to report on my second year's experience with the white tepary bean, which, through the kindness of Mr. Clothier of the Tucson Agricultural College, I brought into Riverside County last spring.

As a rotation crop in lieu of summer fallow I had the following return: May planting, listed, one cultivation, 600 pounds to the acre, soil red adobe. May planting, listed, neglected, 400 pounds to the acre, soil the same. Another field of two acres was lost, the quail and rabbits totally destroying it.

As a cover crop it proved a great success. In a young two-year-old lemon grove it ran one and one-half to two tons of cover crop, and a portion which I matured threshed out 1700 pounds to the acre. In an old orchard I made a failure, due to quail.

The season was too cold for the bean to do its best. It needs lots of heat and to be let alone as much as possible. Irrigation, if used, must be done sparingly or it will produce successive crops and shatter badly.

I find that as a rotation crop with grain it is a success, and as it is superior to the navy as an edible bean, should have a great future. Any stock, cattle, horses or swine, hens, ducks and turkeys eat the bean hay and enjoy it, so there is no loss attached to its growth or cultivation.

More extensive rice culture is being urged for Florida.

OH! MIKE!

Pat—Have ye christened yer new baby yet?

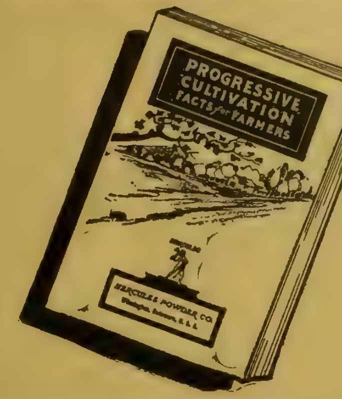
Mike—We have.

Pat—And phwat did ye call it?

Mike—Hazel.

Pat—Er'a, glory be to God; 223 saints to name yer kid after and ye had to go and name it after a nut!

The Use Of
Hercules Dynamite
On Farm, Orchard and Ranch



PROGRESSIVE CULTIVATION FACTS for FARMERS
HERCULES POWDER CO.

Write for a Free Copy of this Book

Every man who operates a farm or ranch should have a copy of "Progressive Cultivation." In its pages many of the problems which confront him daily are solved. In a way it is a text book that points the way to better, more productive cultivation.

Here are a few of the subjects on which it treats, picked at random from the index pages: Air in the Soil, Alkali Soils, Benefits from Subsoil Blasting, Controlling Erosion, Disposal of Stumps, Ditch Blasting, Draining Swamps, Felling Trees, Gully Filling, Handling Dynamite, Rejuvenation of Orchards, Road Building, Tree Planting, Well Digging.

You will find this book of great value to you in your work. Thousands of men use it as a reference book and would not be without it.

Write today for your copy. Fill out the coupon below *in full* and mail it. "Progressive Cultivation" will reach you promptly.

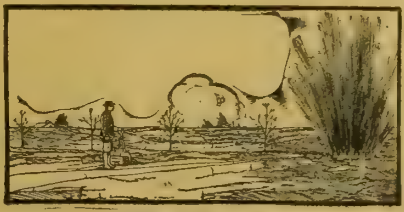
The Best Way to Plant Trees

Those who have once used Hercules Farm Dynamite for the planting of trees never employ any other method. They find that, in the first place, the planting is done much more quickly and easily than when a spade is used to do all the work. Secondly, and still more important, the benefits to the tree are so great and so valuable that the method which produced them becomes the *only* method to the idea of the experienced.



Blasting the Hole

The difference between the growth and yield of a tree planted in a dynamited hole and one planted in a spade dug hole are almost unbelievable.

Planting the Tree

During the first year alone the development of the former will be almost twice that of the latter. When the trees begin to bear the yield of the one which has received the benefits of dynamite is much greater than that of the other. Its fruit is larger and of a better flavor.

When you have trees to plant don't fail to use Hercules Farm Dynamite. In "Progressive Cultivation" you are told just how to use dynamite to produce more, and better fruit.

Breaking Rocks with Hercules Dynamite

The illustrations reproduced here show well the efficiency of dynamite when used to break up rocks and boulders preparatory to removal.

Before

The rock in question was blasted by means of a mud-cap. The dynamite stick was laid upon the rock at the point which one would naturally strike if attempting to break it with a hammer. The charge was then covered with a quantity of mud pressed down firmly. In the lower picture the result of the discharge is shown. The entire operation takes but a few minutes, and at the end of it the rock is broken into small pieces easily handled and removed on a stone boat.

After

For large boulders or rocks deeply imbedded in soil the snake-hole or block-hole method of blasting should be used.

In "Progressive Cultivation" these methods are described in detail. Write for this book.

FINE EXHIBIT

The educational force of the recent fruit growers' convention was greatly increased by the exhibits of farm and orchard appliances and implements. It is practically correct to say that there were hundreds of these different exhibits, and almost everything that would interest the orchardist was on hand at the convention. There were some seven or eight tractors, and trucks were still more numerous, and of course cultivators, together with similar implements, made up an exhibit almost equal to that at the recent state fair at Sacramento.

This is the first attempt to make such an exhibit at a state fruit growers' convention, but we do not believe it will be the last, for we think those making the exhibits were repaid for their efforts, and surely the orchardist was.

VALUE OF CONVENTIONS

One great value of state conventions is that they give opportunity to see representative men in all lines of effort. At the state fruit growers' convention were such men as J. H. Hale, a great peach grower and great orchardist generally, in fact a great man. E. H. Grubb, the potato specialist, was in good company in mixing with the orchardists, and brought a fund of information regarding his European experience to the special potato session. In addition, there were specialists from the United States department of agriculture and a great number of practical orchardists of this state.

Fruit growers should make more of the opportunity offered by these conventions. The attendance at Los Angeles was good; it should have been far better, however, considering its value.

SERIOUS DISEASE

A most serious condition faces the live stock interests of Chicago and in fact many points of the Middle West. This is a serious outbreak of the foot and mouth disease. The Chicago stock yards have been quarantined, as have several other important shipping points. This disease has appeared in this country two or three times before and is so serious that the department of agriculture has gone after it with such vigor that it has been crushed out. The present outbreak is by far the most serious that has ever visited the country, and it seems to have appeared almost simultaneously in many different sections. It has been charged that the department has not gone after it with its usual vigor. We are not informed on this point, but we trust most thorough work will continue until it is absolutely stamped out. This has been done; it can be again.

TIME OF TRANSITION

An attendant at the state fruit growers' convention, in session this week in Los Angeles, remarked that matters horticultural, especially as to legislation, were in a state of transition, that is, there would be many changes within the next few years or even within the next few months. A representative legislative committee has been at work for a year or more discussing matters of legislation affecting the fruit industry. There is much confusion at the present time owing to diverse ways of handling matters that are of vital importance to orchardists. The nurserymen especially find themselves unable to get a bearing on the various ordinances which obtain in the different counties. As stock which is received with satisfaction in one county is forbidden entrance to another, nurserymen say that it is almost impossible to conduct a state business. One of California's largest nurserymen has asserted that if this state of affairs continues it will be but a short time until nursery stock must all be brought in from outside the state for the nurserymen within the state cannot live under the present management. The horticultural commission grants that much of the contention of the nurserymen is true.

Will the present county horticultural commission system remain? Will the state horticultural system remain? Will the state board of agriculture remain? Or will all of these be changed and a more consistent and effective organization, similar perhaps in effectiveness to the United States department of agriculture, take its place? This has been suggested, in fact a committee was appointed at the horticultural commissioners' meeting to draft certain changes from the present horticultural law. These will probably be referred to the larger and more general legislation committee. Many favor, instead of the present county system, a state district system which shall ignore county lines, but take into consideration topographical lines, including in one district certain sections that lie similarly and have similar fruit products.

Certain it is there will be many changes in California horticultural matters, and we believe more satisfactory conditions will be brought out of what now appears to be chaos.

GOOD FARMING

Good farming—just plain, ordinary, common sense, fundamental farming— is the foundation for success in every branch of this industry.

Nowhere is this more emphasized than in the discussion of the potato industry that is so greatly interesting California and Pacific Coast growers now.

For years Hon. E. H. Grubb, the great potato authority of Colorado, Idaho, California and the world, has been preaching "rotation of crops," "grow grass in order to have sod land to prepare for a potato seed bed," "raise live stock on every farm," "use vigorous, healthy, well stored seed"—and a long list of things that are the fundamentals of every kind of farming everywhere in the world.

Foreign experts like Dr. Westerdyke and Dr. Appel tell us these same things and emphasize good cultural methods and proper fertilization—the same as Mr. Grubb has been doing—and they all urge the use of commercial fertilizers as another factor for maximum yields and profits.

There has been too much "hit or miss" speculative farming in California and the west—too many who say "Well, I'll take a gambler's chance at a crop—if I win all right—if I lose all right." Improper attention to details, under capitalization and a lack of realization of the fact that farming is a long time business that must have a well thought-out plan for operation covering a long period of years, make many such farming ventures a failure. And when they fail they hurt the operator—in spite of his gambler's spirit.

Sometimes so much has been invested in these farming propositions that they gradually become organized along sound farming business lines, but more often they fail and the organizer, promoter or capitalist condemns farming.

Mr. Grubb brings to us from Europe a more firm conviction than he has ever had that we must come to the careful, well planned, diversified farming methods of England, Scotland and the countries on the continent. And he is more than ever enthusiastic about California as a place where diversified farms—fruit, field crops and live stock—can be made to produce greater per acre returns in money, satisfaction and joy of living—than anywhere else in the world.

Agricultural Notes

The Pacific International Livestock Exposition will be held at the Portland Union Stockyards, North Portland, Oregon, December 7-12.

The Panama canal was closed to traffic five days, October 15-20, by a landslide in Culebra cut. Fifteen ships were detained one or more days each and will have claims on the government for demurrage.

Florida's county demonstration agents are reported as doing most excellent work. Especially successful has been their work in hog cholera serum inoculation. In the one county of Alachua alone more than 4000 head of hogs have been inoculated since May 1.

For the first time in several years the railroads of Texas are able to take care of the autumn traffic without experiencing blockades of loaded cars of cotton at Galveston and at interior concentrating points. This because the European war has prevented movement of the raw cotton to manufacturing centers across the ocean.

The 11th annual meeting of the Farmers' Educational and Coopera- Union of America was in session the last week in October at Fort Worth, Texas. More than 2000 delegates were in attendance. The principal issue before the meeting was the cotton situation in the South. Government aid to the cotton growers was strongly urged.

According to newspaper reports investment bankers are urging that the interstate commerce commission grant the petition of the eastern railroads for a five per cent increase in freight rates because of the psychological effect "a change in the attitude of the commission toward the railroads" would have on foreign investors in railroad securities.

On the spelling of "coconut" the Ceylon Morning Leader gives the following: "Sir Edward im Thurn, speaking before the Royal Horticultural Society, said the nut now known as 'coconut' was similar to the face of a monkey, and so the Spanish word 'coco,' meaning a grin or grimace, was attached to it. When Dr. Johnson was writing his famous dictionary he had an article on the 'Coconut,' but a careless proofreader passed a mistake in the spelling of the word, the compositor having inserted an 'a,' and the word appeared as 'cocoanut.' This spelling became general, but the nuts are now known as 'coconuts,' 'kokernuts,' and 'kokers.'"

The Barbados Agricultural Review gives some interesting uses of sugar: "Sugar and molasses are said to be used in the shoe-blacking industry to a considerable extent. Soap-making finds a use for sugar in the place of glycerine. Copying ink is made of one part of sugar added to three parts of ordinary ink. * * * The walls built in this island some two centuries ago are said to have been built with some molasses put into the mortar. Even in the tanning industry and in silvering of glass mirrors, they say sugar is used. We would urge scientist to go forward and find some more uses for our staple commodity in this progressive age." The Hawaiian Forester adds: "Experiments are being made in Honolulu with molasses as a binder of broken coral in road construction, oil having been proved unsuitable for mixing with coral, although the right thing for binding other macadamizing material."

Agricultural News Notes of the Pacific Coast

Northern California

D. W. Thorne of Placerville has recently purchased a herd of 225 Angora goats from Modoc County.

The Yolo County farm bureau held its first annual harvest festival at Woodland, October 30. Agricultural exhibits were made by all the farm bureau units.

Placer County is now considering the organization of a farm bureau and securing a county farm adviser. For this purpose a meeting was held in Auburn, October 31.

Three-year-old Bartlett pear trees on the P. R. Cox farm on the Packer tract of the Sacramento Valley Irrigation project in Glenn County produced 30 pounds of fruit per tree.

Work on Reclamation District 1001, in Sutter County, is nearing completion. When it is finished in the spring it is estimated that 33,000 acres of land will be opened to agriculture.

A prune growing center is being started in Glenn County northeast of Willows. Among those who have plantings are Leo Mitchell, S. Severance, Guy Waite, Baker Bros., R. V. Fox and Mrs. O. Goldsworthy.

It is expected that the survey of the Anderson-Cottonwood irrigation district in Shasta County will be finished the first part of this month, when a mass meeting of all irrigators will be called at Anderson to discuss ways and means of best carrying out the project.

Central California

The Associated Raisin Company has decided to feature family packages of raisins for holiday shipment.

A plant has been established near Woodlake, in Tulare County, for the manufacture of syrup from sorghum. The product is declared to be equal to that of the southern states.

Arizona stockmen who have been looking into the possibilities of Kings County as a beef raising section claim that from $15 to $20 can be realized in 90 days on alfalfa fattened stock.

The annual meeting of the stockholders of the Fresno County Agricultural Association will be held December 2, at which time directors and officers for the coming year will be elected.

Two apiarists of Kings County have prepared unique exhibits for both the Panama-California and Panama-Pacific expositions by placing foundation cones in sections to spell out the words "Alfalfa Honey." The letters stand out transparently with striking effect.

One hundred acres of farm land on which four men and four horses will be employed have been leased by the West Coast Potato Association at Stockton. Half of the land will be used for the production of seed, free from disease, and the other will be used for experiments in crop rotation.

Southern California

Chili pepper growers of Garden Grove are planning to form a cooperative marketing association.

Fruits and vegetables form a portion of the exhibit at Oceanside's annual chrysanthemum show.

A petition is being circulated in the northern section of Imperial County for the appointment of a dairy inspector in order to keep up the standard of the output of the dairies in that section.

The following officers were elected by the La Habra Citrus Association for the coming year: A. M. Otis, president; William Espolt, George H. Kibler, W. L. York, J. B. Chaffee, C. W. Milhaus and N. T. Edwards, directors.

At the recent annual meeting of the San Fernando Fruit Growers Association the following board of directors was chosen: R. H. Wilkinson, R. H. Maclay, H. P. Canby, B. F. Wolff, L. H. Peters, F. A. Fletcher of Whittier, F. D. Parker.

Investigations in the manufacture of olive paste have been successful. It is hoped that this will lead to more complete utilization of the olive crop, since the demand is for a large size pickle, and a certain proportion of even the larger varieties is too small for pickling purposes. While these small olives can be used for oil, the paste promises to give far better returns to the grower when a demand for it has been created.

The Coast

A thousand carloads of apples will be stored in the Payette Valley of Utah this fall to await more favorable market prospects.

Northern Cochise County in Arizona has formed a good roads association. J. A. Blanks of Bowie was elected president and Willard Belknap of San Simon secretary.

Four thousand head of cattle, valued at approximately $130,000 will be shipped from Lordsburg, New Mexico, soon. June shipments from Lordsburg totalled $200,000.

The eighth annual convention of the Arizona Cattle Growers' Association will meet at Douglas January 4-6. At the same time the Cochise County Cattle Growers' Association will meet.

The voters of Roseburg, Oregon, last week voted to authorize a $500,000 bond issue to assist in the construction of a proposed railroad from Roseburg to Coos Bay, Oregon, in order to secure rail communication with the Pacific ocean, which has been projected for nearly 40 years.

Nearly 25,000 head of cattle was the month's total of cattle shipped from Arizona to the Los Angeles market. The estimated value of these cattle is around $1,300,000. Most of them will be used in Los Angeles and nearby towns for local consumption. If driven in single file these cattle would make a parade nearly 50 miles long.

Read What Users Say ABOUT THE POMONA DEEP WELL PUMPS

"Your Pomona Pump has run 2712 hours, pumping 113,904 inches of water with no trouble and not one cent for repairs."

"Pomona Pumps are not to be compared with other pumps; they are in a class by themselves."

"Your No. 38, 40 H. P. Pomona Pump is delivering 400 gallons per minute at an approximate lift of 210 feet. Everything very satisfactory."

"The Pomona stands hard, heavy pumping and delivers the water from great depths to the surface of the ground at lowest cost."

"We have a very high regard for Pomona Duplex Pumps."

"I have pumped 36 inches of water from a depth of 190 feet for three years with a No. 28 Pomona Pump, running at least 8 months day and night out of each year, with little or no repairs."

"I was educated as a mechanic and never saw a smoother running or more satisfactory piece of machinery than a Pomona Deep Well Pump."

"My No. 28 Pomona Pump lifts 41 inches of water 220 feet, using 28.8 H. P. at the meter, which is better efficiency than you estimated."

Roeding's New Plan for Planters

—a plan that means protection for you against costly mistakes—that insures every planter a full reward for his money and labor.

OUR interest in the planter does not cease when he gets the trees and we get his money.

There are thousands of successful planters in California whose success is due in no small measure, not only to the fact that they were foresighted in buying the best and truest trees obtainable (Roeding's), but that they have also asked and made use of our advice regarding planting, pruning, irrigating, etc. We offer you free of charge the benefit of our more than thirty years' experience.

Write us today.

We shall be glad to tell you more about our service plans. Remember we grow everything that grows—citrus and deciduous fruit, as well as ornamental stock of every kind and description. Let us quote you prices.

Roeding & Wood Nursery Co.

1607 E. Washington St., Los Angeles, Cal.

Save That Last Crop of Alfalfa

By Putting It In An

Ideal Green Feed Silo

Alfalfa makes an excellent grade of silage, very palatable and nutritious and carrying a high percentage of protein. By letting this last crop grow to maturity and then putting it into an Ideal Green Feed Silo, you are beating nature at her own game, for it can be siloed in the rain if necessary.

Order Your Ideal Green Feed Silo Now

and get it up ready for this last crop of alfalfa when it matures. You can commence feeding it just as soon as the silo is filled, and by next spring it will be empty and ready to receive the first cutting, that as hay is usually not worth handling, because of the weeds it contains and the trouble experienced in curing it.

Nothing excels silage, especially legume silage, during the dry summer months for keeping up the flow of milk. Next spring's filling will carry you through the best part of the summer, with the silo ready to receive that crop of corn next fall, thus providing a juicy succulent feed all winter which will permit you to reduce the amount of mill feed necesary to buy at least 50 per cent, a saving more than sufficient to pay for the entire outfit.

Order your Ideal Green Feed Silo now and stop buying so much mill feed.

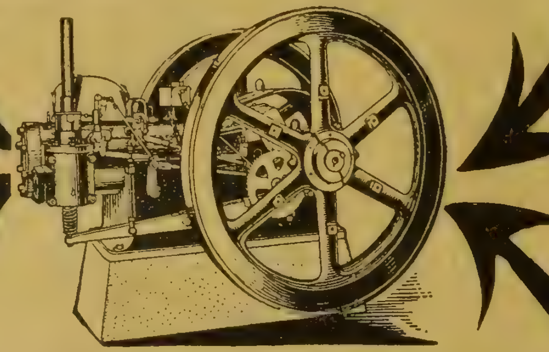
Alpha Engines and Smalley Cutters

WESTERN GAS ENGINES

There's trouble enough on the ranch without engine trouble. You don't want an engine you have to tinker with all the time. You can get an engine at most any price—as low as you want to pay—but when you get a cheap engine your troubles have just begun.

Western Gas engines are built to run without trouble. Very quiet and steady—perfect balance—no jerky, wobbly, explosive hit-and-miss running.



WESTERN GAS ENGINES

are economical of fuel—consuming special gas oil at 2¾c per gallon; they cost ⅛ of a cent per horsepower per hour to operate.

Before buying an engine send for our catalogue—free to all who write for a copy.

Live Stock and Dairy

PROFITS FROM ALFALFA

Written for California Cultivator

By Leroy Anderson

WHAT would be the probable average net profit per acre from alfalfa where it is fed to dairy cows, water for irrigation being pumped 100 feet? Of course hogs would also be run in conjunction with the dairy. This is in the center of the Santa Maria Valley where natural gas can be had for 50 cents per 1000 cubic feet or electricity for $50 per horsepower.—Subscriber, Santa Maria.

It is as impossible to give profits from alfalfa growing as it is from the banking or grocery, or any other business. It is a matter controlled by so many different conditions, primarily that of business ability, that is impossible to tell. However, this question was referred to Dr. Leroy Anderson for more specific answer, at least as to general principles.—Editor.

Yes, it is quite impossible to give profits from alfalfa growing. This year the alfalfa grower who produced hay for market finds little if any market and consequently loss instead of profit. With good dairy cows to eat the hay the story is different. The most that I will attempt is to touch upon some of the major points and in so doing certain premises must be assumed.

It may be safe to estimate that one and one-half acres will carry one cow and her proportion of calf and hog pasture. The cow ought to produce 250 pounds of butter-fat per year which at 30 cents per pound average price is a gross return of $75. The by-products such as her calf and her proportion of hog returns may be calculated at $25 more, or $100 per cow for each one and one-half acre, or $67 per one acre. The average production of butterfat for California cows is about 150 pounds. Thus it will be seen how much better than the average the cow in question must be.

Not knowing the size of the ranch, let us suppose it to be 80 acres, for we must have some area base in calculating cost of irrigation. The relative cost of pumping by electricity at $50 per horsepower per year or natural gas at 50 cents per 1000 cubic feet is given me by Professor Etcheverry of the university irrigation department as follows: The 100-foot lift would require, for a No. 4 centrifugal pump throwing about 400 gallons per minute, a 20 horsepower electric motor or a 25 horsepower gas engine. The cost of installing the electric plant would be $1,200 and of the gas engine plant $1,800. The fixed charges, i. e., depreciation, interest and repairs, would be 12 per cent, or $144, on the former and 17 per cent, or $300, on the latter. Assuming that there would be four irrigations annually of about six inches each, or a total of two acre feet per acre, the cost of irrigating them is:

Gas engine plant—Fuel cost, $250; fixed charges, $300; operation, $130; total, $680, or $8.50 per acre.

For electric motors — Electric energy, $1,000; fixed charges, $144; attendance, $65; total, $1209, or $15 per acre.

We have then an annual cost of at least $8.50 an acre for water. For two acre feet of water there would be required 90 24-hour days of continuous pumping to cover the 80 acres. This would mean two men, or one man for 180 days at $1.50, or $270, which is $3.50 an acre. Five cuttings would be a minimum yield probably in Santa Maria Valley, and this would cost $2 a cutting to mow, rake and put into stack or barn, or $10 an acre. We have then $8.50 plus $3.50 plus $10, or $22, cost per acre per year to get the feed to the cow barn. On this 80-acre farm two men would be required to milk and feed the 50 or more cows, tend calves, pigs, etc. If they boarded themselves their pay would amount to at least $55 a month, or $1,320 for both per year, which is $16.50 an acre. A third man might be needed the year round which would add $6.60 more per acre.

These are some of the items that need to be considered. And one should not forget to count interest on value of land, livestock and anything else in which money is invested (except irrigating plant which has already been considered). I will not attempt to go more into detail for no two men do things just alike. Moreover, not knowing the working conditions on the ranch I am speaking at random. If the subscriber is to do much of the labor himself he will draw some of the pay roll money and thus alter some labor items. If the milk is to be retailed instead of cream sold for butter making the gross return would be much greater.

HOG CHOLERA GERMS IN SOIL

Hog cholera germs may live in the soil for months. Lurking on farms where the disease has been present they may reappear at any time unless proper precautions are taken.

This is shown by the experiments of a Wisconsin farmer who has brought his case to the attention of the officials of the agricultural experiment station at Madison. Some time ago, after losing a number of valuable hogs from cholera, he changed the location of his swine barns and yards and later raised a fine bunch of healthy pigs.

Naturally he thought that the cholera jinx had left him, but recently it reappeared in his herd. The fact that he has not pastured his herd upon the same ground which pastured cholera-sick hogs has not prevented the reappearance of this dread disease. Much of the entire premises may have been infected at that time.

The veterinarians recommended that all hogs, the temperature of which were not already above normal, be immediately given the proper serum treatment—the one remedy by which a herd can be saved from total extinction

Feeding Roots: More and Better Milk—Beef Mutton

ALL animals improve in condition and increase their product of flesh, milk, wool, etc., by being fed liberal rations of cut roots. No matter what else you feed, cut roots will improve the ration. They add a zest which means increased consumption of roughage and aid in digestion and assimilation. They put a top finish on market sheep and lambs. They put color and richness in milk and cream and resulting butter.

Banner Root Cutters

for both hand and power, prepare roots in the best possible way. Cut so fine as to prevent all choking of animals. It's done with the **"Non-Choke Curve Cut."** Made in seven sizes. Write for free illustrated booklet. Every animal condition will be improved by feeding a ration of cut roots.

See and try a
DE LAVAL
Cream Separator

YOU can't afford to take any chances when buying a cream separator.

It is important, that you get a machine which will stand constant wear twice a day for many years to come.

It is important that you get a machine that will run easy and be easy to wash and clean.

It is vitally important that you get a machine which will save all of your cream instead of losing enough in a year to amount to more than its cost.

We know that if you see and try a De Laval, the chances are ten to one you will buy it. It's its own best salesman.

Any De Laval agent will be glad to set a machine up for you on your own place on trial, and if you want to keep it and it isn't convenient to pay for it now, we have an arrangement with our agents whereby you can buy it on easy terms so that it will actually save its cost while you are paying for it.

when cholera appears. They also urged the farmer to carefully clean up the barns and pens, burning the carcasses of all dead hogs and all litter which might be infested with the disease. Then, to prevent the recurrence of the malady which might be caused by lurking germs or introduced in the feed or by the purchase of stock, they advised him to maintain a cholera immune herd, thus doing away with the likelihood of future losses

CALIFORNIA GUERNSEY CLUB

Guernsey cattle breeders of California have formed themselves into an organization for the mutual benefit of themselves and the breed in the state. At the recent state fair initial steps were taken and a committee was named to draft a form of organization to report the same at a meeting to be held at Modesto on October 17. This meeting took place as scheduled and after hearing the report of the committee the constitution and by-laws, as drafted by the committee, the same was adopted. The following officers were then elected: President, Wm. H. Saylor, San Francisco; vice-president, C. S. Rasmussen, Loleta; secretary-treasurer, D. O. Brandt, Owensmouth. Three members to serve with the president and secretary as executive committee will be appointed in the near future.

The California Guernsey Club invites all persons interested in the breed to join the club and has provided that those who join will become life members by paying a comparatively small fee. There are now in the state quite a number of enthusiastic breeders and admirers of the Guernsey and the officers hope to build a strong body out of this material in time to participate in the big "doings" in Guernseys, and other breeds of livestock as well, at the big exposition in 1915.

HORSE TALK

Don't cut the mane of a work horse. The long hairs are a protection to the top of the neck.

If the mane is cut the collar presses on the stubby hairs and causes irritation and sores.

Keep the collars clean. Keep the neck clean, and the long hairs of the mane well brushed and free from tangles.

When putting on the collar, part the mane carefully.

The collar should fit so perfectly that there is little wear or friction on the top of the neck.

Each horse should wear his own collar, fitted by a person with common sense.

The horse with a sloping shoulder cannot work with any ease or profit in a collar made for an upright shoulder.

The colt that is kept fat from his babyhood will make an easy-keeping horse.

The young colt should be taught to eat oats with his dam as early as possible.

The grain should be fed all along. a small quantity daily when on pasture, and in winter with less hay.

Colts handled and fed in this way make better horses with more bottom.

With this kind of care and feeding, style is developed with the growth, and the value of the young horse is proportionately increased.

Bring the colts to the stables during the day while the flies are so vicious.

Put them in the pasture at night.

The wear and tear in fighting flies is a senseless loss.

A lump of sugar, or an apple given them, will soon teach them to come at the call.

Call each one by his name. This early education goes a long way in making a valuable and trusty horse.—Farm Journal.

MORE AND BETTER HOGS

The California Swine Breeders' Association is just mailing to its members a 30-page booklet on "More and Better Hogs in California." It contains a constitution and by-laws, and a list of officers and directors of the association and a series of articles by various members. These articles are short and crisp and make excellent reading. Still better, we believe they make for more and better hogs. Just at the present moment hogs are going down in price but long before Cali-

200 ACRE FIELD AFTER CUTTING—SOWED 2 LBS. SEED PER ACRE—HARVESTED 1½ TONS CURED HAY TO ACRE

$udan Grass

Cheap, Good, Sure Feed for Your Stock

Whether it's for beef or milk—for work or driving animals—you'll find no feed can equal *Sudan Grass.* Stock find it particularly palatable, preferring it to other forage. It exceeds timothy in nutritive value—is more satisfactory than sorghum or millet. Is easily cured and handled, making the finest hay when baled and stored,—or splendid ensilage.

In the short time since its introduction into this country by the Department of Agriculture its wonderful properties have placed it at the head of all forage crops. "There is no better grass in the world for conditioning work animals or milk production than Sudan," says Mr. B. Youngblood, Director Texas Experiment Stations.

It produces feed in abundance wherever grown, with or without rain. Is a marvellous drouth resistant—thrives in spite of excessive moisture. In dry and semi-arid districts of the South and South-west where other feeds can not be raised it yields heavy crops.

Four pounds of seed will sow an acre that will return 400 pounds seed and from one to two tons of hay the first cutting. Grows again immediately from the stubble—good for two, three or four more cuttings each season—a ton to a ton and a half per cutting. It can not become a pest—strictly an annual—causes no trouble through infesting the land like Johnson grass.

Read the following statement made by Mr. B. Youngblood:—
"We took special pains to organize a local experiment association at Lubbock, and have a considerable acreage planted there, as we felt that the Texas Plains country would be one of the best seed producing centers in the United States."

Lubbock Association Grass Seed is absolutely pure, genuine and thoroughly reliable. It has been grown under the supervision of Texas Sub-station No. 8, located in Lubbock County, V. L. Cory, Supt., and every field has been officially inspected, certified and passed before harvesting.

WARNING—We are the only authorized agents for selling LUBBOCK ASSOCIATION GUARANTEED SEED. Be sure that all seed you buy has our name and trademark stamped on the bag. None other is genuine. This is the only way you can get protection from adulterated seed and insure a profitable harvest.

Put up in 1-2-5-10-25-50 and 100 lb. packages. Retail prices delivered:

fornia is raising as many hogs as she ought to supply her own markets they may be still higher. With cheap alfalfa and feeds of all kinds much lower than in former years it is certainly a misfortune to send perfectly good money over the Rockies for stock which could better be raised on the Pacific Slope. May the California Swine Breeders' Association have length given to its arm in its work of drawing to it more and more swine breeders.

Answers in this column by Dr. Wm Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Warbles

In your issue of July 17, 1913, Page 64, appears an article entitled "An Insect Injuring Cattle." In explaining the habits of this warble fly there does not appear any suggestion as to the possibility of preventing or controling its attacks on cattle. I have a young cow, recently fresh, that has a few of these insects just beginning to pass out through the skin on her back, and I will be glad if you will publish an article explaining the manner of treatment for this pest.—Subscriber, Phoenix, Ariz.

It is very seldom that warbles are found in the backs of cattle at this time of the year. The fly deposits its eggs during July, August and September, and the grubs appear under the skin about the middle of the winter. When the warm weather comes in spring they fall to the ground. Sometimes they do seem to stay beyond their regular time. About the best way to keep the fly from depositing eggs on cattle is to apply some good fly repellant. Two gallons fish oil, one gallon oil of tar and two ounces of crude carbolic acid, well mixed, makes a good one. This can be applied with a spray or it may be rubbed on with a cloth. It should be applied two or three times a week. When the warbles do appear under the skin they should be removed by placing the ends of your thumbs on each side of the bunch and pressing down. This will cause the warble to pop out and the sack that it was in will take care of itself.

Bloody Milk

The milk in half the udder of one of my cows is thick and of a dark brown color when we first begin to milk, but after milking part it clears up and seems all right. She has no fever and we do not think has been hurt. We also have a three-year-old heifer that shows some blood in the milk when stripping. What is wrong?—Subscriber, Patterson.

Bloody milk may be caused by an injury or from too rich food. In either case the udder should be handled very carefully when milking and the cow should be milked oftener than twice a day if possible. Reduce the grain and feed some green corn fodder or alfalfa. Also give the following: Mix three pounds of epsom salts, one pound of common salt, four ounces of bicarbonate of soda and two ounces of nux vomica. Divide this into eight powders and give one every night.

Worms

Will you please tell treatment of hogs for worms?—Subscriber, Santee.

Give a teaspoon of powdered areca nut in some sweet milk every morning for a week. The reason for giving it in the morning is because the stomach is empty then and the medicine will reach more of the worms. Reduce the dose if the hogs weigh less than 100 pounds each.

Skin Disease in Cattle

I have a fine Jersey heifer, fresh one month, that has an affection of the skin that takes the form of small dry pimples under the hair, only no-

Poultry for Profit

POULTRY PROBLEMS AND THEIR SOLUTION

SO MANY poultry queries have come in for answer that it has been decided to turn over the whole poultry department this week to questions and answers. Here you will find Mrs. Koethen's solution of your neighbor's poultry problem which may be yours tomorrow. Be sure to keep this issue where you can easily find it when your own poultry problem presents itself. If it is not solved on this page, write it down and send to the Cultivator, and Mrs. Koethen will tell you what to do.

Fireless Brooder

Please give dimensions and directions for building fireless brooder.—S., Pomona.

To make the Philo fireless brooder, which is the type generally used, take a box 14 to 18 inches square and about six inches high, and cut a door in one side. The box must be of rather heavy boards and perfectly tight. By tacking pieces of thin wood each side of the door you can make a groove to run the door in so that the brooder can be closed when the chicks are inside.

In each corner of the box nail a peg four inches high and about an inch square. This is to rest the quilt frame on. For this frame use lath or strips of light wood, making it a little smaller than the box so that it will rest on the pegs in the corners and still leave space next the sides of the box for air. The air which comes through this crack is all the chicks get at first, so see to it that the frame does not fit tightly inside the box. Tack a square of outing flannel to this frame, letting it sag in the middle so low that it will rest on the backs of the chicks.

Now you are ready for the quilt, which is made of cotton batting and cheesecloth, neatly tacked as you would tack any comfort. This should be so large that it will sag down into the middle on the outing flannel and yet reach to the ventilation space outside the frame. It is a good plan to make two such quilts so that one may be added when nights are cold. On very cold nights you may need to lay a burlap sack above the quilts, but never cover the crack that has been left for ventilation.

A box 14 inches square will hold 25 chicks. One 18 inches square will hold 35 at first, but they will have to be divided by the time they are two weeks old. It will hold 25 chicks for a month. Never let them crowd it.—J. A. K.

Mash for Poultry

Please give good formula for mash for producing eggs. What is the best way of feeding grain? Give a formula for a full day's rations for egg producer for 1500 hens. What do you think of steamed barley?—Subscriber, Sebastopol.

The "Association mash," which is generally used by poultrymen around Los Angeles, is as good as any. It consists in winter of 600 pounds bran, 400 pounds ground barley, 300 pounds shorts or middlings, 100 pounds alfalfa meal, 100 pounds feed corn meal, 150 pounds kafir meal, 150 pounds beef scrap, 150 pounds fish scrap, 50 pounds fine ground bone, 10 pounds salt. This is calculated for a ton of mash. This dry mash is kept before the hens in hoppers, and the grain mixture, which is varied at different seasons or in accordance with the price of different grains, is fed in deep litter at night. Some poultrymen feed a light feed of grain in the litter in the morning and a heavier feed at night. Some feed all the grain at once late in the afternoon. Some feed a single grain in the morning and a mixture at night. It does not matter just how it is done, provided the hens get all they want, and always provided they get a good feed of green stuff, alfalfa, lettuce, kale, chard, or sprouted grain, if you have nothing better, in the middle of the day.

If the above mash seems too complicated, try the following: six quarts bran, one quart corn meal, one quart middlings, one quart ground barley, one quart alfalfa meal, one quart beef scrap, one quart linseed or soy bean meal or fish scrap, one-half quart coarse bone meal.

California poultrymen are feeding a good deal of barley this year. The best method of preparing it is to soak the whole barley 12 hours or longer, then pour it into a box with a crack in the bottom, so that the water can drain off, cover with a sack and let it stand till the tiny white roots begin to show. The longer it is soaked, the shorter the time required for sprouting. This may be used for the morning grain feed, and wheat, or wheat and oats, or wheat and kafir corn, or wheat with a little whole corn, if your hens are Leghorns, fed at night. Some poultrymen feed the barley, mixed with wheat and corn, as soon as it has drained 24 hours, without waiting for it to sprout.

I formerly used a good deal of steamed barley, but I like the whole barley, sprouted, better. One reason for this is that there is less waste; another, that the hens seem to like it better; and my third reason is that it

MOLTING TIME

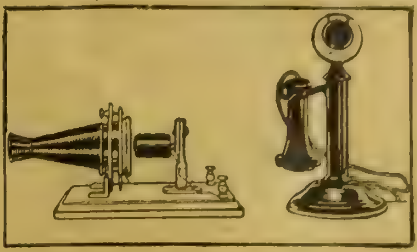
How the Public Profits By Telephone Improvements

Here is a big fact in the telephone progress of this country:

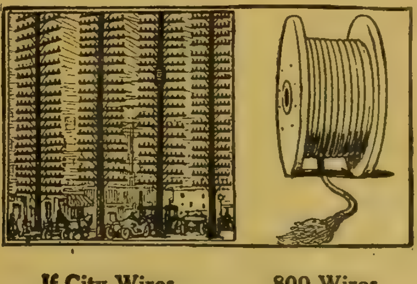


Original Bell Telephone 1876

Standard Bell Telephone To-day

Early Telephone Exchange

Typical Present-day Exchange



If City Wires Were Carried Overhead

800 Wires in Underground Cable

Hand in hand with inventions and developments which have improved the service many fold have come operating economies that have greatly cut its cost.

To appreciate these betterments and their resulting economies, consider a few examples:

Your present telephone instrument had seventy-two ancestors; it is better and cheaper than any of them.

Time was when a switchboard required a room full of boys to handle the calls of a few hundred subscribers. Today, two or three girls will serve a greater number without confusion and very much more promptly.

A three-inch underground cable now carries as many as eight hundred wires. If strung in the old way, these would require four sets of poles, each with twenty cross arms—a congestion utterly prohibitive in city streets.

These are some of the familiar improvements. They have saved tens of millions of dollars.

But those which have had the most radical effect, resulting in the largest economies and putting the telephone within everyone's reach, are too technical to describe here. And their value can no more be estimated than can the value of the invention of the automobile.

This progress in economy, as well as in service, has given the United States the Bell System with about ten times as many telephones, proportionate to the population, as in all Europe.

is difficult, when barley is steamed, to get just the right amount of moisture into it. If too little water is added, the barley is dry and the hens don't like it. It too much is added, it is sloppy and apt to affect the bowels. The steamed barley, when it is just right, moist and not watery, is excellent for young stock and a nice change for the hens once in a while.

It is difficulut to say just what a full day's rations for 1500 hens should be. Different breeds require less or more and hens eat more when they are laying than when they are not. Proffessor Jaffa of the University of California, in Bulletin 164, has calculated several mash formulas on the basis of so much per hen per day. He allows about 10 pounds of dry mash and from nine to 12 pounds of hard grain for 100 hens, which would be about 150 pounds of mash and from 135 to 180 pounds of grain for 1500 hens per day. Professor Dryden of the Oregon station, in Bulletin 157, makes a similar estimate, but allows 100 pounds of mash and 200 pounds of grain for 1500 hens in one day. The Cornell station agrees with Professor Dryden in the proportion of mash to grain feed. Professor Rice says in Circular 90, "Fowls should eat about one-half as much mash by weight as grain. Regulate the proportion of grain and ground feed by giving a light feed of grain in the morning and about all they will consume at the afternoon feeding (in time to find grain before dark). In case of pullets or fowls in heavy laying, restrict both night and morning feeding to induce heavy eating of dry mash, especially in the case of hens".

From the opinions quoted above it is quite plain that there can be no fixed rule as to amount of feed per hen. My own plan, in feeding hard grain in litter, is to try to keep a little in the litter all the time so that the hens may find it if they care to scratch for it. Generally speaking, a handful is enough for one hen at a single feeding.—J. A. K.

Feather Picking

I would like to know how to break chickens from picking feathers from other fowls.—Subscriber, South Pasadena.

Make an ointment of a teaspoon of extract of aloes, well mixed in a cup of lard. Rub this on the feathers about the portion of the bird which has been plucked. One or two doses of these feathers will usually cure the bird that has been picking feathers. Trim off the point of the beak of any bird you know to be guilty of this bad habit, and keep all your hens busy scratching.— J. A. K.

Liver Trouble—Tuberculosis

In past six months I have lost about 30 chickens and hens from a trouble I can do nothing to stop. They will commence to droop, stop eating, keep by themselves away from the flock, sit with head down and mope around for several days and finally die. Have cut open several and their livers seem enlarged and covered with yellowish spots. Sometimes the liver is nearly decayed. Can you tell me the trouble, cause and remedy? They have for feed wheat, barley, alfalfa, milk and occasionally a bran mash and meat.—Subscriber, Lompoc.

Without knowing more about the symptoms it is impossible to say whether these chickens had tuberculosis or liver trouble. The two diseases are much alike in their effect on the liver, and a post mortem by a bacteriologist is the only certain means of distinguishing between them. In general these different symptoms characterize the two diseases: In tuberculosis the comb becomes pale and the bird loses weight, sometimes becoming greatly emaciated. The eye is bright, the appetite good, till near the end. There is likely to be diarrhoea and frequently lameness. A post mortem reveals the liver and often the spleen and intestines covered with whitish or yellowish cheesy nodules. Tuberculosis rarely attacks young chickens, but confines itself to adult fowls.

The first symptom of liver trouble is usually a dark red comb which becomes purplish or even black as the disease progresses. There is watery diarrhoea, lack of appetite, and indisposition to move. A post mortem shows the liver enlarged, conjested with blood or spotted.

You will need to study your birds very carefully to find out which of these diseases is carrying them off. Feel them on the roost at night and if you find that any seem much lighter than they should, put them by themselves as suspects. Look them over by daylight and if you see any with pale combs put them by themselves. Diseases of this sort come on gradually. The birds are ailing a good while before the trouble seems serious.

Your ration is not well balanced, and it may be this is all that ails the chicks. Feeding too much barley is said to cause liver trouble, and a diet of hard grain without a mash of any sort rarely agrees with fowls of any age unless they are on range, and then not for long. Try keeping this dry mash before all your birds all the time: 2 parts (by weight) bran; 1 part middlings; 1 part alfalfa meal; 1 part ground barley or ground oats; 1 part medium coarse beef scrap; ½ part ground bone; a little charcoal. See that girt, shell and fresh, clean water are always before them. For the grain feed use wheat alone or wheat and Kafir corn, and make them scratch for it in deep litter. Give all the green feed they will eat once a day, oftener if you have it.

It would be a good plan to give all your birds a dose of Epsom salts twice a week for a few weeks. Put the salts in a moist mash which may be made by moistening the dry mash with milk, about half a teaspoon for each bird, less if they are not grown. This will cleanse the system. and help to prevent clogging of the liver.

If, after studying your birds carefully, you are convinced that the symptoms point to tuberculosis, remove all suspected birds from the flock; disinfect the houses with cresol disinfectant, the runs with lime, and the troughs and fountains with boiling water, and try in every possible way not to carry infection from the sick birds to the well ones. When you are certain any bird has this dread disease, kill and burn at once. There is no cure.

Cresol disinfectant is made as follows: Shave a ten-cent cake of laundry soap into a pint of water; steep it until a paste is formed, then stir in one pound of commercial cresol, which may be bought from any druggist for about 30 cents. Beat this mixture till the paste is dissolved, then stir in one gallon of kerosene. Apply to the walls and roosts with a brush.—J. A. K.

VETERINARY QUERIES

(Continued from Page 472.)

ticeable by passing the hand over the parts. The heads of the pimples rub off easily taking the hair with them. They are most numerous on the shoulders, neck and upper part of the front legs. There seems to be some swelling under them in the skin. I have used lime and sulphur and now am using zenoleum with only partial success so far. Do you think it is due to the condition of the blood?—Subscriber, Bairdstown.

Wash the parts clean with warm water and soap, removing all the scabs that are loose. When dry anoint the parts with carbolized olive oil which you can procure of your druggist. Also give a physic of epsom salts.

Nasal Gleet

I have a mare with what appears to be a very severe cold in her head. She has difficulty in breathing and snorts and coughs a great deal when eating. There is a discharge from her nostrils and she makes quite a noise in breathing. A local veterinarian locates the trouble in her nostrils and prescribed steaming by sprinkling eucalyptus oil on hot water and allowing her to breath the fumes. It does not yield to this treatment. Can you suggest something that might relieve her?—Subscriber, Buena Park.

It may be nasal gleet, and if it does not extend too far back into the head, into some pocket, the following powders will dry it up: Powdered gentian four ounces, powdered nux vomica two ounces, sulphate of iron four ounces and enough farina to make one pound. Give a tablespoon in the feed morning and evening. If this does not relieve her in two or three weeks then it will probably be necessary to trephine the head, which can only be done by a good veterinarian.

THE OLD KENTUCKY HOME

By Stephen Foster

The sun shines bright in the old Kentucky Home;
'Tis summer, the darkies are gay;
The corn-top's ripe, and the meadow's in the bloom,
While the birds make music all the day.
The young folks roll on the little cabin floor,
All merry, all happy and bright;
By-'n-by hard times comes a-knocking at the door—
Then my old Kentucky Home, good night!

Weep no more, my Lady,
O weep no more today,
We will sing one song for the old Kentucky Home,
For the Old Kentucky Home, far away.

They hunt no more for the possum and the coon,
On the meadow, the hill and the shore;
They sing no more by the glimmer of the moon,
On the bench by the old cabin door.
The day goes by like a shadow o'er the heart,
With sorrow where all was delight;
The time has come when the darkies have to part—
Then my old Kentucky Home, good night!

The head must bow, and the back will have to bend,
Wherever the darkey may go;
A few more days, and the trouble all will end,
In the field where the sugar-canes grow.
A few more days for to tote the weary load,——
No matter, 'twill never be light;
A few more days till we totter on the road,——
Then my old Kentucky Home, good night!
Weep no more, my Lady,
Oh, weep no more today!
We will sing one song for the old Kentucky Home,
For the old Kentucky Home, far away!

COMMON SUPERSTITIONS OF THE SOUTH

In nearly every human heart there is a trace of superstition; this is more strongly in evidence in the unlearned and ignorant. The Southern darkey possesses this trait in a marked degree.

The screech owl, with its shrill, shivering cry coming around the home of a darkey at night will give him horrors, as he considers this a sure sign of death of some member of the family. You will see the shovel and tongs quickly thrust into the fire, pockets turned inside out, or cuffs turned back, these being the charms supposed to drive the unwelcome intruder away.

"I jes' knowed Sarah Ann's little Julie gwine die," said old Aunt Chole to me on hearing of the death of a little negro girl of the community, "case I hearn dat old screech owl hollerin' round de house several nights while she was sick."

My old nurse would never sweep under the bed in which any one was lying sick, nor would she pour water on the fire in the room of a sick person, as these things are thought to exercise an evil influence over the disease, possibly inducing a fatal termination.

Something bad is surely expected to happen to the person who sees the new moon through the tree tops or over his left shoulder.

A darkey never turns back for something forgotten without first making a cross mark on the ground and spitting on it to prevent bad luck.

In some districts, the darkies have a strange custom of laying a newborn baby on the floor and sweeping around it, thus, as they say, sweeping away all cares and troubles from its future life.

If a rabbit crosses the road in front of a darkey and goes to the right, the darkey proceeds on his way rejoicing, expecting only the best results from his errand or journey; but if the rabbit goes to the left he loses heart, thinking only bad luck will come to him. It is considered especially desirable to be the possessor of the left hind foot of a graveyard rabbit; but no darkey would kill a graveyard rabbit to obtain one.

"Miss Marthy, company's comin' to dinner," said the cook one day, "case I drapped de dish cloth on de floor, and de old red rooster, he flew up on de fence and crow'd three times."

Other signs of company coming are the scissors dropping and sticking up in the floor, or a chunk of wood falling down from the fire. If there is a burning, tingling sensation of the ears, a darkey will tell you that some one is talking of you; if the right ear, they are saying something good of you; if of the left ear, something bad. To stump the toe of the right foot, they think, is a sign that you will be a welcome visitor at the place to which you are going; to stump the toe of the left foot, you will be unwelcome.

If Aunt Chloe finds a pin on the floor with the point toward her, she picks it up with a smile of satisfaction—that is good luck; but if the head of the pin is toward her, she thinks that is bad luck; but she wards off the evil by walking around until the point of the pin is toward her and then picks it up.

Southern cooks always insist on having hog jowl and peas on New Year's Day. This is supposed to insure you against want during the year. There is a couplet commonly quoted:

> "Eat hog jowl and peas
> And live at your ease."

Aunt Chloe always saves the bones of the hog jowl to rub her "jints" "when I has de rheumatiz," she said. "I always rubs wid dem to ease my pains."

Many darkies have a habit of wearing silver dimes in their shoes as a charm to keep away witches and evil spirits.

It is considered bad luck to meet a funeral procession. I have known darkies to turn around and go a mile out of their way rather than meet and pass one.

The negroes have a peculiar superstition that when a person is buried the tools used in digging the grave must not be carried from the cemetery until the day after the burying. They tell you some one in the community will die soon unless the tools are left all night in the cemetery

A negro will never burn the wood of a tree that has been struck by lightning; to do this is thought to bring the worst kind of luck.

The old darkies are strong believers

Cherry Trees

Cherries are the first, the most attractive and the best fruit of the summer season. This, together with the fact that they are very profitable, yielding from $400 to $600 an acre, makes them a good "buy" for any fruit grower in position to raise them.

Our Block includes Bing, Black Oregon, Black Tartarian, Burbank, Royal Ann, and other good varieties on Mahaleb and Mazzard Root. Write Us First.

in "conjuring," as they call it. A negro woman living near my home came over one day in great distress to tell me that she was being "conjured." She said that every morning when she arose she found something white like flour sprinkled around her house. She had an enemy, she said, who was trying to bring her under an evil spell. So firmly was she convinced of this that she left a good place and moved to another part of the country.

I have seen old darkies whose limbs were drawn with rheumatism, who would tell me with the utmost sincerity that they had snakes, frogs and lizards in their limbs and body—placed there by the "conjurer."

A few years ago there lived on my uncle's plantation a stout, healthy negro girl of about seventeen years of age. Coming in from the field one day and, being warm and tired, she lay down on some planks in the yard and fell asleep. While she was sleeping a negro boy came by and, in a spirit of michief, cut off a lock of her hair and ran out of sight before she was sufficiently aroused to see who it was. Placing her hand upon her head and finding the lock of hair gone, she made a great lamentation and would not be comforted, saying that some one had taken her hair away to "conjure" her. From this time she grew sad and melancholy, lost her appetite, and finally grew sick of fever. In her delirium she would start up wildly and beg some one to bring her hair back to her.

One day, in a conscious interval, she called her mother and said: "Mammy, I'm dying, but if you will jes' git me back that lock of hair I will get well." But her mother did not know who had the hair, so in a few days the poor girl died, a victim of her delusion.

Poor Uncle Solomon Johnson for a number of years had been crippled with rheumatism, and, as he was not able to work, the good things of life were very slow about coming his way. At last he died, and, as is usually the case when a negro dies, all his friends and kindred gathered from near and far to enjoy the "settin' up" and the funeral.

Uncle Sol, had suffered with rheumatism for so long his knees were drawn up, and when he was dressed they found it impossible to straighten them; but, at night, after he was laid out and they were waiting for the coffin, the watchers in that little hillside cabin witnessed a strange sight. Uncle Sol's knees suddenly straightened out and his feet slipped to their proper places. Immediately the superstition in the darkey nature asserted itself.

"Did you see dat?" was asked. "My Lord, what's dat?"

No one waited to answer questions. There was a rush for the door and the little cotton patch around the cabin gave evidence of the haste with which the panic-stricken darkies fled, for the white, fleecy locks were scattered over the field.

The preacher, being a good runner, was a little in advance of the others, but, taking a short cut through the branch, he became entangled in some bamboo vines, and, being in a hurry, he could not extricate himself. Having a dread of being left alone so near the fearful cabin, he endeavored to stay the fleeing darkies. "What you niggers runnin' for?" he asked. "Dere ain't nuffin to be feared of. You all is just de biggest fools I eber seen in my life." It was in vain he called to them. They left him to his fate and tarried not until the doors of their own homes closed upon them.

Superstition is dying out to some extent. Is is not so common as it was a few years ago. Education is doing much to relieve the negro mind of those old foolish superstitions.—Southern Ruralist.

The Flame of Acetylene Light is Small and the Burner Peculiar

You have probably noticed that a Pilot Country Home Acetylene burner is shaped like the letter "Y."

And that the little gas openings in the arms of the burner are only pin hole size. So small they let out only half of a cubic foot of Acetylene in an hour.

You might leave one of these Acetylene burners open by accident all day—and even then there wouldn't be gas enough in the air of the room to enable you to set fire to it if you tried.

As a matter of fact, you would have to leave the burner open fully three days and nights in a room twelve by fourteen, with windows and doors closed tight, before there would be any fire or explosion whatever.

And the chance of your leaving a burner open that long is not worth considering. The pungent odor of the escaping gas would be certain to attract attention in a few seconds.

Insurance reports say that in a list of 10,000 recent fires and accidents caused by illuminants, 9990 were charged to the misuse and abuse of electricity, kerosene, gasoline and city gas and only ten to the misuse and abuse of Acetylene.

That's why the engineers of the National Insurance Board have endorsed Acetylene. They say it's safer than the oil illuminants it is rapidly displacing.

You should use home made Acetylene yourself to light your house and barns and to cook your meals.

All the facts and figures are in our illustrated catalogue which we send on request. Address

Citrus Fruit Market

LOS ANGELES, Nov. 11, 1914.

Valencias are selling very satisfactorily. Shipments have all been made, and in face of the fact that the eastern markets are filled with quantities of Florida fruit which is selling anywhere from $1.48 to $2.00, our Valencias are commanding big prices. At the prices mentioned for the Florida fruit there is practically nothing to be turned over to the grower. Early navels from this state will be held until they can stand the test. But it is probable that within the next week or two shipping will be quite lively. Lemons are commanding good prices, but the market is without features.

Shipments

Shipments of oranges to date from Southern California since November 1, 184 cars, lemons 79, total 263. To same date last season, oranges 7 cars, lemons 12, total 19. To same date, two years ago, oranges 168 cars, lemons 89, total 257. From Tulare County, Nov. 7-8, oranges 6 cars, lemons 5, total 11. From Butte County, Nov. 7-8, oranges 1 car.

IDEAS FOR THE COOK

(Continued from Page 477.)

Dinner

Filet of Fish Creamed Potatoes
Cauliflower, Butter Sauce
Bellevue Salad
Almond Cream Cake Coffee

Corn Meal Souffle

Cook three-fourths of a cup of corn meal in one pint of hot milk until thickened, add salt and remove from fire; then beat in singly yolks of four eggs, adding lastly the stiffly beaten whites. Bake in moderate oven in earthen baker until light and nicely browned and serve at once from the baking dish, either with butter or gravy.

Bellevue Salad

Select choice head lettuce, allowing one head to two persons. Remove green outer leaves and cut each head in half, wash and drain thoroughly. Make a French dressing with salt, paprika, oil and vinegar and pour into the upturned halves so that each leaf is moistened. Sprinkle with finely chopped hard-cooked egg and minced chives and serve.

Fried Filet of Fish

Clean the fish thoroughly, then wipe dry and roll in egg and bread crumbs, or if preferred dip in milk and roll in seasoned flour. Place in the frying basket and immerse in hot fat until crisp and delicate. Serve with tartar sauce.

Almond Cream Cake

Cream one-half cup of butter, add one cup of sugar, and mix in alternately one-half cup of milk or water and two cups of pastry flour sifted three times with two teaspoons baking powder. Beat well, flavor and add five stiffly-beaten whites. Bake in two layers.

Whip sweetened cream until stiff; flavor with almond extract; add chopped blanched almonds and spread between and over the layers. Garnish with cherries.

A Telephone Saves Time and Money

It's easy! With a first-class telephone line from home to town you and your neighbors can talk direct to crop buyers every day without driving over those long miles. You can watch the market for top prices—ask the railroad station if your freight has come—order supplies from the store—find out what's doing at the stock yards—set a time with the grist mill for grinding your grain—get the doctor *quick* when you need him. Besides all this, you can talk business or pleasure without leaving your own doors.

Western Electric
Rural Telephones

are standard for use on the farm. Thousands are in daily use by progressive farmers everywhere. If you are still without telephone service, write us for information on how it can be secured. Write the nearest house below, and mention this paper.

built like a high grade auto

Throughout The Yuba Ball Tread Tractor an endeavor has been made to gain greatest strength with least bulk and weight.

It was the adoption of this policy that made the high-grade automobile of the present day dependable, simple to operate and cheap to maintain.

THE YUBA BALL TREAD TRACTOR

An ample margin of safety is built into every portion of the machine. Each part is made strong enough to withstand much greater strains than it will ever be called upon to bear in the course of ordinary work. Highest grade materials and careful workmanship insure maximum wear and reliability.

In outward appearance The Yuba Ball Tread Tractor resembles an automobile—neat, clean-cut, pleasing to the eye.

There is a booklet describing it fully.

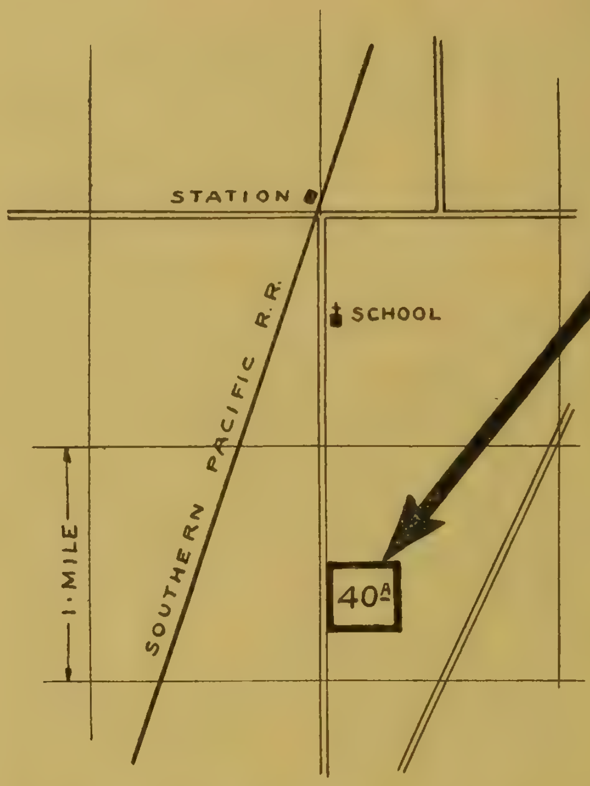
on a

FORTY ACRE FARM



This forty acres is one and one-half miles from the station on the Southern Pacific Railroad.

Clean, Level, Good Land

It is adapted to growing Alfalfa, Beans, Corn, Almonds, Figs and Olives. Located in the Sacramento Valley, near the Foothills.

It is now without improvements, but ready for immediate crops.

The Price--$150 per Acre. **One Quarter Cash, Balance to Be Arranged**

THIS PRICE INCLUDES a Modern Pumping Plant, completely equipped and installed; WATER WHEN YOU NEED IT. Also a selection of trees and seed; a plow, harrow and cultivator.

THIS EQUIPMENT AND FURNISHING PLACES YOU IN POSSESSION OF A FARM THAT IS READY FOR IMMEDIATE OCCUPANCY AND EARLY CROPS.

REMEMBER THAT NOW—November and December—are the months to prepare the land for a full crop next year. We advise in planting, and supply seed and trees best suited to the land.

Send this paper to any friend who you think may be interested in such an opportunity. We will send a three months' subscription to The California Cultivator, without charge, to any one in the East who is interested in owning a California farm.

Write for further particulars of this inviting opportunity to establish yourself on a profitable and fully equipped farm.

45th State Fruit Growers Convention

State Commissioner Cook Calls to Order the Largest Fruit Growers Convention Ever Held in California. Over 1200 Registered. Next Convention to be Held at Stanford University. A Full Week of Interesting Discussions, Together with Instructive Exhibits. Most Interesting Topics, Legislation and Permanent Society Organization

HAVING been present at many of the conventions of the State Fruit Growers in California, where the registered attendance was less than 200, it certainly was gratifying to note that the registration at the convention just closed in Los Angtles passed the 500 mark, then passed the 800 mark, and later the 1,000 mark, reaching finally even past 1,200, which made it apparent that the last State Fruit Growers convention was the greatest ever. It will be recalled that the previous convention at Davis reached a total registration of 722. The registration, however, is only an indication of the attendance, for without question, more people came who neglected to register than put their names on the book at the entrance or on the filing cards at the headquarters at the Hotel Clark.

It was a great week, not only in numbers, but in results. Perhaps the most pleasant feature, and possibly the most educational, was brought out by the social side of the convention. The exhibit rooms, the hallways leading to the assembly room and the lobby of the Hotel Clark were one continual hum of greetings and conversation.

If there was a weak point in the program it was its length and the length of most of the addresses, which prevented discussion. In face to face conversation the discussion was continued, however, and, as noted, I believe this was the most valuable feature of the whole convention. One feature was a distinct surprise; for the first time in the history of this old association there was made an exhibit of appliances and tools useful to the orchardist. This exhibit comprised almost everything from tractors, of which there were six, through the range of cultivators and plows and other implements down to even the tiniest tip for the spray rod. In the arcade, hallways and gymnasium of the old normal school there were exhibits of plants and grasses, pumps and even small engines, water tanks and frost fighting pots, blasting powder and other items, mention of which would fill a column of this paper. Not content with the interest manifested, the exhibitors employed a quartette of colored singers with their banjos, and their music competed with the general program. Fortunately, however, the music was far enough away so that it did not disturb.

The Exhibits

The most educational of the exhibits was that of the citrus experiment station of the University of California. The large room just off the main entrance to the assembly hall was filled with exhibits showing results of fertilizer applications and of soil treatment. Also there were exhibits of roots and trunks of trees which had been destroyed by foot rot or mal di gomma and many kinds of fungous trouble. These exhibits were made more effective by display of large photos of tree trunks and tree tops. One feature which encouraged citrus growers by the promise it gave of future utilization of the wastes of the citrus industry was the display of marmalades, jellies and other products made by the laboratory of the department of agriculture. This consisted of oranges and lemon oils and extracts, ctirate of lime, and many other by-products. These are seldom produced in California in a commercial way, but the department has been conducting experiments for the past few years, and it is expected that these investigations will lead to more extensive saving of our waste products. This will have the advantage not only of turning more money toward the fruit grower but also will aid in keeping much low grade fruit out of market.

EUGENE GRUBB OF COLORADO AND CALIFORNIA
Potato Expert Just Returned from Europe Where He Has Been in the Interest of the Panama-Pacific Exposition.

Luncheon and Excursions

Referring again to the social side, there were various features, but two on Friday are worthy of mention.

The Los Angeles chamber of commerce and the sixth district agricultural association united in a luncheon to 100 or more horticultural commissioners and visitors from the northern section of the state. The luncheon was tendered in the assembly room of the permanent state exposition buildings erected at the sixth district agricultural park. This building has been constructed for some years, but it was not until within the last few months that the exhibits have been installed, and it was a surprise even to those who have known of the existence of this building and a permanent exposition in Los Angeles. There are some of the most perfect examples of processed fruit ever seen, and the method of arranging the exhibits makes the entire display a work of art. There is none of the cheap bunting appearance to any of them, and all has the appearance of permanency. The building is arranged as an exhibit chamber, and in addition to the assembly rooms there are rooms arranged for moving pictures and lantern slides. The entire institution is made an educational factor which will be state-wide in its influence.

In addition to the state building, on the same grounds is a permanent museum and art gallery built by the county of Los Angeles. The interest manifested in the anthropological exhibits exhumed in the brea beds west of Los Angeles was so great that it was indeed hard to get the attendants away from them, and many expressed the desire to return and inspect more fully.

On the same afternoon the chamber of commerce of Whittier tendered a complimentary excursion to those who could break away from the convention program and go to that thriving city some 20 miles southeast of Los Angeles. The private car carrying the guests was greeted by music of the state school band. Autos were in waiting and the fruit growers were given a two hours' ride through the rich citrus and walnut groves of Whittier and La Habra. A stop was made at the beautiful country home of Mr. S. W. Barton, where all were urged to fill their pockets with walnuts; another at the much talked of Ganter avocado tree. A luncheon was served at the Elks' club rooms, and opportunity given for a general social time. President Robbins and Mr. Arnold of the chamber of commerce told some of the nice things about their home town that they had forgotten to mention in the course of the drive, and the visitors, through Harry P. Stabler, horticultural commissioner of Sutter County, expressed their appreciation of the afternoon's entertainment.

The one thing pleasanter than showing California to appreciative easterners is showing California to thorough going Californians, and this was what the people of Whittier had to do. The visitors from Siskiyou, from Humboldt, and all the counties down to Los Angeles were ready to admire, and indeed they found ample grounds for admiration and were not slow in expressing it. The beautiful Whittier citrus belt and the hospitality of the City of Friends will be the brightest spot in the memories of those attendants at the State Fruit Growers' Convention who were so fortunate as to take the trip.

On two or three occasions during the convention there was more or less spirited discussion, but the program was so filled that there was little opportunity for the heat to become oppressive. One rather warm occasion was at the discussion of the formation of a permanent association. The state "association" has been in existence for the past 30 years or more without any definite organization. All who have entered the doors of the assembly rooms have been constituted "members" with full voting power. This resulted on one or two occasions some years ago in packing the convention for the sake of influencing the resolutions. It has been felt by many that this loose form of organization should be succeeded by something more definite, as at present the state horticultural commissioner and his secretary are the only recognized authority. For the past few months several have discussed in a general way the matter of perfecting such an association and when it was brought before the convention the plan was unanimously supported and a committee appointed to make recommendations. This committee's report was:

STATE COMMISSIONER A. J. COOK AND C. C. TEAGUE OF LIMONERVA ORCHARDS.

Report of Committee on Permanent Organization

Your committee appointed to consider permanent organization of the horticultural interests of the state have carefully considered various

(Continued on Page 486)

Clover
Vetches

produce humus and nitrogen in the soil — the two big essentials in groves and orchards. From our studies of the needs of the citrus belt this year, we are strongly recommending the following:
FENUGREEK: is a rank and rapid grower, producing successfully on poor soils.
MELILOTUS INDICA and BURR CLOVER are also adapted to heavy and poor soils as they produce a deep and heavy root system resulting in the breaking up and in the porosity of the soil.
VETCHES: We are headquarters for imported and Oregon vetch.
We cannot too strongly advocate the inoculation of seed for best results. Hundreds of our patrons testify that the use of

FARMOGERM

300%
Crops

has increased their crops from 200 to 300%, thus giving more humus for the soil and more nitrogen — gathered from the air by the nitrogen gathering bacteria and deposited in the soil through the nodules they form. The cost—less than $2.00 per acre. For booklet on *Farmogerm*, advice on Cover Crops and Prices, write to Dept. C

Citrus and Tropical Fruits

AVOCADO CULTURE AND EXPLOITATION

Translation from the Spanish Made for California Cultivator

By I. J. Condit

THE "aouacate" was at first thought to be native to the West Indies but later writers state that it was introduced into the Spanish colonies from Colombia. Oviedo, about 1526, recognized that the avocado was not really a pear tree but resembled the laurel more closely. Some of the early historians have described the fruit as being a food of great importance to the natives of South America.

The name which has been proposed for the fruit is the "avocado" which is as widely used as "alligator pear," and although the name is not free from objectionable points, its adoption would help to prevent confusion between this salad fruit and the true pears. In Chile, Peru, and Ecuador, it is called "palta," a name which is said to have been given it by the Incas who brought it from the province of Palta to Cuzco Valley.

The avocado belongs to the family Lauraceae, genus Persea. It is generally a tall tree, but there are some dwarf varieties. In some kinds the skin of the fruit is soft, smooth, flexible and very thin, while in others it is tough, granular, and sometimes very thick. The seed contains an astringent, bitter, and milky juice which gets black when exposed to the air, forming an indelible ink. Some authorities, Mez for example, name 47 species of the genus Persea, which produce avocados, all of which, with one exception, are native to America. On the other hand Pax admits but ten species, only one, Persea gratissima, being native to America. In some cases these authors used the fruit as a basis for classification, in others, the flowers and leaves of the tree, as among the 47 species described by Mez there were 28 the fruit of which was unknown. Observations made by Schomburgh show that the seed frequently presents three cotyledons and sometimes the seed sprouts in the tree itself, a fact which led him to believe that these seeds might serve as a sure means of propagation without necessarily resorting to graftage.

The plant did not spread as a cultivated plant in the old world until commercial relations with America had become well established. A great number of varieties are now cultivated, however, especially in the region between the tropics, extending to about 36 degrees latitude, although some varieties can be grown outside these limits. Its culture has been stimulated in Cuba, Costa Rica, Guatemala, Peru, Brazil, Hawaii, Porto Rico, Jamaica, California, Florida, Canary Islands, Australia, and in a general way in Mexico, Central and South America. The avocado zone extends from the region of the pines to that of the mangoes, the temperate climate producing the most palatable fruit. The avocado tree thrives in nearly every state in Mexico and its culture should be extended.

The diversity in form and color of the Mexican avocados is such that an almost perfect and continuous gradation can be formed, with very few laps or discontinuities. The varieties of Costa Rica have a somewhat darker colored flesh near the skin, while those of Cuba have the skin and flesh perfectly distinct, and the flesh does not contain bundles of fibers as it does in other varieties. The fruits of Hawaii are of larger size and several fruits mature on the same branch. Acosta relates that he made the distinction between the avocados with thick skin and those with thin skin in 1590; he described the palta as a large tree with very big leaves and fruits resembling pears, with a big seed and soft flesh which separates from the skin and both looks and tastes like butter. The fruit called "palta" was used long ago in Mexico as a food; this fruit has a good taste and thin skin which can be taken off as easily as that of a stewed apple.

The numerous applications and uses of this fruit make it possible to prepare several very delicious culinary products from it. The proportion in weight of flesh, seed, and skin is variable, but on an average it is about 9:2:1; of this only 20 to 25 per cent must be considered, as the rest is water. The great amount of oil contained in the flesh makes the fruit comparable to the olive, although the latter fruit contains in some varieties much more oil than the former. The oil of the avocado has been separated and studied by some chemists who named it "Grasa Persea," or avocado oil, said to be similar to laurel lard (oil extracted from Laurus nobilis).

The avocado is more exacting as to climate than as to soil. In Porto Rico compact clay soils are good for the avocado if good drainage is provided. Low, undrained land is not adapted to its culture, as the roots will not thrive in a water-logged soil. In a general way it can be said that an avocado orchard should be in a deep, fertile soil, with a porous subsoil. There are many varieties in Mexico which grow and thrive in cold climates such as the Federal Districts, Atlixco, Tecozautla and others where there are severe winter frosts. The abundance of avocado crops sometimes gives name to a place as in Tizapan, where a part of the city is called Aguacatitla, excellent fruits having been produced there since early times. The climate there is cold and the soil contains a grat proportion of clay and humus. In the warmer sections the "paguas" reach a greater development. Since strong winds are injurious to the trees they should be planted only in protected places. There are many places which produce without great care or cultivation very good fruits of the best flavor and excellent taste, qualities which cannot be due to improved systems of cultivation but only to favorable local conditions.

In some places such as the district of Amealco, State of Queretaro, in a ravine called "El Chamacuero," there is a wild variety in great abundance, which has a small, black, oblong fruit as big as a prune, with a very thin skin and soft flesh, the color of which is a dirty green and the taste of which is bitter. The seed is also very small and oblong, having an integument adherent to the stone. The stone is fertile and the plant undoubtedly propagates itself by this means. It is a branching shrub so exuberant and abundant that it forms thickets. The leaves are opposite, entire and similar to those of the laurel. It is commonly called "Aguacate de Coyote" or "Aguacate cimarron." It is certain that these wild plants would improve with cultivation and could be used as stock for other varieties.

The avocado can be propagated either by seeds or by buds, the former method being most common, since the art of budding has not been much diffused among the people. Selected seed should be planted as soon as possible to prevent drying and early loss of vitality. The seedlings are transplanted to their permanent place in the field at the end of a year, most of them being left to fruit as seedlings, a few others being budded. The large tap root of the avocado makes transplanting difficult, and care should be taken not to injure or mutilate this root. The advantage of budding the avocado are: the tree is almost certain to produce fruit in one year from budding; the size of the tree can be controlled; orchards can be made to contain trees of only one variety; the hardiest and best variety for stock can be selected. Flute-budding is recommended. A rectangular bud is taken from a healthy branch, placed on the stock where a similarly shaped piece of bark has been removed, and then waxed over. Shield budding in the form of an inverted T may also be used. The avocado can also be propagated by means of cuttings and layering, but the operation in the first case is doubtful of success and in the second laborious.

Heavy clay soils are dangerous for the avocado trees as such soils are liable to crack, leaving the roots unprotected and exposed to the heat of the sun. A leguminous cover crop which will also serve for forage may overcome this difficulty. The land should be irrigated whenever necessary to prevent excessive dryness. Irrigation is not advisable during the blossoming time as it may cause the blossoms to drop; it is better to apply water at the beginning of this period to facilitate the blossoming. The improvement of an impoverished soil in the case of the avocado consists in supplying potassium nitrate, ground bone, and vegetable ashes, but the amount and proportion of each of these substances will be subject to the analysis of the soil. Young orchards on fertile soil will maintain a good crop for many years.

Certain factors influence the production of fruit. An excessive humidity interferes with the proper pollination of the flowers (this is also the case with the mango), and many plants do not produce fruit at all. To avoid this the time of blossoming must be modified. Varieties adapted to humid sections may be introduced or judicious root pruning to encourage blossoming may be practiced. This is accomplished by nature in the case of some trees growing in rocky ground; the roots run along the crevices and cracks and the checked development produces an increase in crop. The operation of uncovering the roots and exposing them to the air is dangerous and it is therefore best to follow the practice of many growers in several sections of Mexico who prune the roots carefully to increase the production of fruit. By means of these methods the time of fruiting and the quality of the fruit are modified. A reduction in the size of the seed, either by selection or by breeding, is important. The seed should fill the cavity, for if it is free to move from one side to the other, the flesh is bruised during transportation and decay is more liable to occur. Another important point in the improvement of the fruit is the appearance and texture of the flesh which should be free from fiber. As to the flavor of the fruit it was found long ago that the varieties of smaller fruits, although having less flesh, are of delicious and excellent taste, especially those coming from Southern Mexico. Fruits of poor taste are very rare, and when they are found it is generally due to the fact that they have been picked too green or spoiled by a forced maturity.

It was at first believed that the largest avocados were produced in Porto Rico, but still larger specimens have been found in Florida. Although the size increases the beauty of the fruit, it does not at all improve the quality. Medium-sized fruits are in great demand among the majority of consumers, while the larger or exceptionally large ones are sought only by a few merchants. A point of much greater importance than the size of the fruit is the proper presentation of it in markets distant from the point of production.

The principal insects which attack the avocado are: Hoplophora monogramma, the avocado fly, which sucks the sap from the tender shoots and sometimes the leaves; Copaxa multifenestrata, the avocado butterfly, which occasionally does some damage; Triofas magnoliae, a gall insect which works on the leaves; and a curculionid beetle called in some places "Picudo del Aguacate," the larvae of which make long galleries along the branches between the bark and wood. A fungus, Rhytisma persea, often attacks the leaves, interfering with their functions and causing them to dry up little by little. A species of Tillandsia or moss and several species of mistletoes are often found living on the tree.

The profits of an avocado orchard are great because the tree continues in full bearing from 50 to 60 years, many trees often producing more than 1000 fruits. Little attention has been paid to this crop, and it may be true that with the increase of production the prices will be lowered, but on the other hand new markets will be formed and the increased demand will restore the good prices. In short, the prolific nature of the tree and the small expense connected with its culture will make this one of the most profitable fruit crops.

(A copy has recently been received at the university, division of citriculture and a translation made of Boletin Numero 71, de la Estacion Agricola Central Mexico, entitled "The Culture and Exploitation of the Avocado" by Gabriel Ruiz Valencia. The bulletin was written in June, 1912, and consists of 70 pages of text with several figures of fruit and leaves and seven colored plates of insects and diseases.)

In painting wood work, which has been painted before, do not rub the brush dry on the work expecting to rub the paint in. Paint cannot be rubbed into a painted surface. Lay the paint on evenly, always dipping the brush often enough to keep paint in the bristles. It should work like a fountain pen.

It does not pay to buy a cheap varnish. A good coach body varnish will give good results in kitchens and living rooms. It will wear well and stand washing with pure water. Do not use soap to keep it clean after the new coat is on, it kills the lustre and ruins the varnish.

About Increasing
Orchard Profits

THE object of every business is to make money. If fruit growing is your business, you can only increase your profits by producing *more* and *better* Fruit, which means planting More and Better Trees.

Buying Cheap Trees is False Economy

When planting trees, *know* they are profit-makers. Don't be satisfied with *just* trees, or even *good* trees—plant our *prize winners.* They cost *no more* and *must be better,* otherwise they could not have won first prize in competition with California's best stock.

Gold Medal trees mean Gold Dollar profits for you—plant them this year and take the first step toward increasing your orchard profits.

The First Prize and Gold Medal was awarded our Fruit, Nut and Olive Trees and Grape Vines at the 1914 State Exposition.

A catalog of the best varieties of Fruit and Nut Trees and valuable Horticulture Data is yours for the asking.

The Care and Feeding of Crops

The Value of a Commercial Fertilizer

Commercial Fertilizers differ from the ordinary manures in that they are more concentrated carriers of Nitrogen, Phosphoric Acid and Potash.

One ton of commercial fertilizer contains as much actual plant food as ten or even twenty tons of barnyard manure.

In this concentrated form it is possible to economically transport it to the various farming sections; also the cost of handling, application, etc., of the commercial fertilizer is very much less than barnyard manure.

The elements composing the commercial fertilizer are so prepared as to be more soluble and in a more active condition and more available to plant-life than those of natural manure.

Send for the Above Book

The above is a quotation from it and it readily explains why a commercial fertilizer is more valuable and of less expense than any natural fertilizer.

It tells about Nitrogen, Nitrate of Soda, Sulphate of Ammonia, Organic Nitrogen, Phosphoric Acid, Potash. It tells how these various elements in a concentrated form make it possible for your plants and crops to get the most of food from the soil.

This little book contains 64 pages of simply told, vital facts about the care and feeding of crops.

Be sure and send for it today. You'll keep this little book at hand for constant reference on account of the valuable information it contains.

EMANCIPATOR LITTER CARRIER
LOUDEN MACHINERY COMPANY FAIRFIELD IOWA

MOVE EASIER LIFT MORE NEVER BALK

The Louden Litter Carrier

THIS MAN TELLS WHY HE PREFERS LOUDEN CARRIERS

will enable you to pick up the manure at each stall and convey it direct to the manure pit or to the spreader, without any hard lifting or pushing. A light pull on the hand chain will raise or lower the carrier to height desired, and it will stand firmly at any elevation, empty or loaded; has no trouble-making ratchets, brakes or clutches. Has the most powerful lifting gear of any carrier and moves easily on roller-bearing trolley.

117

E. J. BECKWITH,
of Lisbon, Mich., writes:
"I like the Louden Litter Carrier for the following reasons: 1st, it is easy to install; I did it myself. 2nd, because it has strength and durability. 3rd, no other carrier would work on the short turns in my barn. 4th, the bearings rest on the track at two points, and the strain is less. 5th, in turning corners it works same as bobs going over mounds—the carrier makes the turns gradually and saves both the jerks and the strain on track."

No matter how small or what kind of barn you have, you'll find the Louder Carriers a profitable investment—they will pay for themselves over and over in labor and time saved.

We will send you sketches and suggestions free, for your new barn or remodeling your old one, if you will write us what size and kind of barn you need, also how many cows and other stock you wish to care for.

The Louden Line includes also Steel Stalls and Stanchions, Maternity Pens, Bull, Calf and Pig Pens, Alignment and Go-Right devices, Spring-balanced Mangers and Manger Partitions, Barn Door Hangers, Hay Tools, Power Hoists, Etc.

FRUIT GROWERS' CONVENTION

(Continued from Page 483)

types of organization and desire to submit for your deliberation at least two types of organizations.

First: The committee have considered the organization as at first proposed of a state horticultural society to be composed of all horticultural interests of the state with a corps of officers elected annually, and publishing annually a report of their proceedings financed by the dues of members. The committee believe this plan to be thoroughly practical and think that such an organization once started would attract a membership of from 2000 to 3000 people, which with annual dues of from $1 to $2 would furnish ample means for the publication of the report of the society. The committee are highly in favor of such an organization, if no better plan can be devised.

Second: The committee have considered a second plan which is more ambitious and appeals to them as preferable and as one likely to command the interests of the agriculturalists of the state because of its broader conception and its greater ultimate usefulness in the development of the agricultural interest of the state. This second plan contemplates organizing in one great society all of the varied agricultural interests of the state, including horticulturists, agriculturists, stock raisers, dairy men and men engaged in scientific research related to agriculture. Such an organization would be comparable to the American association for the advancement of science.

The committee contemplates that such a general California agricultural society would have its corps of officers for the general association, and then would be composed of various sections representing the different horticultural and agricultural interests of the state, as for instance the following sections:

First. Citrus fruits.
Second. Deciduous fruits.
Third. Tropical fruits.
Fourth. Small fruits and bush fruits.
Fifth. Nursery interests.
Sixth. Dairy section.
Seventh. Live stock section.
Eighth. Grain section.
Ninth. Vegetable section, and such other sections as demanded by any special agricultural interests. If such an organization were formed the general association would probably hold a meeting biennially, at which business matters of general interest could be taken up, and the association in general be directed by its executive committee consisting of the officers of the various sections.

The different sectional meetings could be held as often as the various sections desire, and in places most convenient for the members of such sections.

The committee see many difficulties in the organization of such a general society, but believe that such difficulties can be overcome, and that a broad general agricultural organization of this sort would strengthen and cement the varous agricultural interests of the state. They would recommend that a strong committee be appointed by this meeting for the careful consideration of these suggestions, and for the drafting of permanent plans, constitution and by-laws to be presented at the next meeting of this association for consideration and action.

We would further recommend that this committee consist of seven members appointed by the chairman of this convention, of which he should be one.

Respectfully submitted, C. B. Messenger, W. B. Ames, H. J. Webber, R. C. Allen.

This report was no sooner before the convention than several connected with the recently formed Farmer's Protective League opposed the adoption of the report on the grounds that such organization had been formed in the Sacramento Valley and was of sufficient scope to accomplish all that could be accomplished by a newly formed organization.

It will be noted that there were two recommendations made by the committee. The first is for the organization of a horticultural society, which would be practically putting on an organized basis the institution which has existed for so many years. The other is far more ambitious, and we believe has a great future if the fruit growers and farmers generally can be brought to see its advantages Careful reading of the report of the committee, which was finally approved without a dissenting vote, will give an idea of the work which may be accomplished by such an organization.

Another report, on which there was no fight whatever, but which had been awaited all week with anticipation of a fight, was that of the legislation

A Tip on Almonds

On this continent Almonds are grown only in California. The American market alone demands *four times* the present supply.

With practically an unlimited home market and a monopoly of the product

Plant Almond Trees if you are seeking a real money-making investment.

We have an extra fine lot of trees growing on Bitter Almonds, Peach, and Myrobolan Root, but as there is usually a shortage of trees on Bitter Almond, place your contract immediately—don't delay.

Kirkman Nurseries

RELIABLE TREES AND VINES

We again solicit the fruit tree and vine orders of the planters of the West, knowing that nothing but the **Best** will satisfy the experienced buyer. Twenty-eight years of successful nursery business has proven the quality of

KIRKMAN TREES

and the treatment Kirkman accords his customers. Our steadily growing patronage has demanded that we grow more stock each year, until we now have more than **five million** trees and vines growing in our nursery plants in California and Arizona. A considerable portion of the stock in our nurseries, which will be ready for delivery this coming winter and spring, is already sold to early customers, but we still have a complete stock of all varieties of fruit trees and vines, as well as a general assortment of **ORNAMENTAL** and **SHADE** trees, etc., etc. What are you going to plant? We have it, without doubt, in large or small quantities. Illustrated price catalog on application. Please mention what varieties you are expecting to use.

KIRKMAN NURSERIES 2525 Tulare Street, Fresno, Cal.

committee. This committte has been working on proposed legislation for more than a year, and many diverse interests have been anticipating recommendations which they would be compelled to antagonize. However, as will be seen by the accompanying report, the recommendations were all of a general nature and did not draw out a fight which had been anticipated, or rather the fight was settled in the committee before coming before the convention.

Report of the Committee on Legislation

DEAN THOMAS F. HUNT OF THE STATE AGRICULTURIAL COLLEGE

As a result of a consideration of the various statutes relating to agriculture in the state of California at the meeting of the State Fruit Growers' Convention in Davis, and of a further consideration during the present meeting, your legislative committee, in the interest of economy, efficiency and the development and protection of the resources of the state, recommends that the State Fruit Growers' Convention records itself as favoring the creation of a state department of agriculture to be administered by a secretary of agriculture. The secretary of agriculture should exercise all the executive and regulatory powers and should perform the duties now vested in and required to be performed by such boards, commissions and officers as follows:

The state board of agriculture, the state agricultural society, the state commissioner of horticulture, the state board of horticultural examiners, the state dairy bureau, the board of veterinary medicine, the state veterinarian, the state board of sheep commissioners, the stallion registration board, the state board of viticultural commissioners, the state board of forestry, the state forester, the conservation commission of the state of California, the state superintendent of weights and measures; the state analyst, the Redwood park commission, the reclamation board of the state of California, the state water commission, and other statutes relating to agriculture not properly belonging to the functions of the University of California.

Your committee recommend that the convention refer the matter to the legislative committte for the purpose of having a bill prepared and presented to the legislature which shall embody the principles set forth in the foregoing resolution. Respectfully submitted, C. C. Teague, Chairman; G. H. Powell, T. F. Hunt, Peter Shields, H. J. Webber, A. J. Cook, W. A. Johnstone, E. K. Strobridge, P. F. Cogswell, G. H. Hecke, M. DeMott, Geo. C. Roeding.

Report of the Committee on Resolutions

Whereas, there have been gathered together for this meeting a large number of valuable addresses and discussions from which the people of the state of California will derive much lasting benefit; be it

Resolved, by the 45th State Fruit Growers' Convention, in convention assembled, that we hereby express our sincere thanks to the state commissioner of horticulture for his strong efforts in procuring this program and in carrying it through to a successful meeting. We would further express our appreciation of the part taken in the arrangements and program by the citrus experiment station of the college of agriculture. We desire further to thank all the speakers who have taken part in the various meetings.

Peaches $10,000 Worth — 400 Tons from 900 Trees in Six Years from Planting

Read This Letter from Mr. C. H. Schmidt of Selma, Cal., who is Shown Beside One of His Peach Trees when They Were Three Years Old:

Selma, Cal., Nov. 14, 1914.

Mr. Geo. C. Roeding, Pres. and Mgr. Fancher Creek Nurseries, Fresno, Cal.

Dear Sir:—

I think you will be interested in a brief outline of what I have accomplished with the peach trees which I purchased of you in 1908.

In the first place, the trees that you supplied me with were just the kind of nursery stock that I know Roeding invariably supplies to his customers. I am only one of the many boosters you have throughout the West who can point with pride to Fancher Creek Nursery grown trees which have created a standard of their own through the exceptional care and thought you have given to the perfecting of all your stock.

The very fact that I had the right kind of a start and in connection with this, that I gave proper attention to the matter of pruning, cultivating and fertilizing has, in a measure, contributed to the very satisfactory results which I have succeeded in obtaining. You have visited my orchard from time to time, but I do not believe you have ever fully realized the success I have met with.

My orchard is now six years old and up to and including 1914, I have delivered from the 900 trees, 400 tons of peaches and have received for the same the tidy sum of $10,000. If I do say it myself, I think there are very few orchardists who can make a more favorable report than this.

Only recently I measured a few of these trees and I was very much surprised to find that they average from two to three feet in circumference a foot above the ground, while neighboring orchards, planted on the same character of soil, ten years of age and older, would not average over one foot in circumference.

I think I have demonstrated very fully that any fruit grower who will secure quality trees to begin with, such as you always furnish, and will put the proper thought into the care of them, will meet with the same result that I have obtained. I want to take this opportunity of thanking you for the advice that you have given me from time to time, and I want to say further that it is this kind of service which does not end after the sale of an article that is appreciated."

Yours truly,

(Signed) C. H. SCHMIDT.

General Agriculture

THE RICE SITUATION IN THE SACRAMENTO VALLEY

Editorial Correspondence

RICE growing as an industry is established in the Sacramento Valley. The first experimental stages have been passed and the problem now is not "Will rice grow?", but "How should the soil be prepared?" "What variety will mature earliest and produce a satisfactory quality of rice?" "How can rice crop be rotated to insure permanence to the industry?" "How can irrigation water be conserved?", and similar things.

Far seeing men who have had the agricultural progress of the Sacramento Valley at heart have believed that rice would some day be a great industry here. Many years ago Hon. Frank Freeman of Willows, Glenn County, secured an appropriation from congress for rice experiments to be carried on in cooperation with state agencies. The project failed for lack of appreciation by legislators in this state. Through all these years he has continued untiring in his efforts to promote the industry. Wm. Grant, agricultural expert and manager for Balfour, Guthrie & Company, began experimenting with rice on one of that company's properties near Biggs several years ago and demonstrated commercial possibilities. Experts in the United States department of agriculture have been working on the prob lem- for a number of years conducting experiments in connection with individuals and companies. C. E. Chambliss, of the bureau of plant industry, has been in charge of this work and great credit is due to him. The government rice experiment station at Biggs has been of value to the industry in trying out varieties, methods, etc., and will continue to be of more and more benefit in years to come. E. L. Adams, in charge at Biggs, is a safe counsellor for rice growers and those contemplating the planting of rice. Conscientious, hard working, trained agriculturalists who have the best interests of the industry they are connected with at heart, as Mr. Adams has, are of inestimable value to the agriculture of America and are a great credit to the United States department of agriculture. The Sacramento Valley Development association has been helpful in the development of the rice business. Four years ago the Sacramento Valley Irrigation Company, at Willows, in Glenn County, grew 42 varieties of rice in a cooperative experiment with the United States department of agriculture. Many other individuals and agencies of different kinds have been and are now engaged in the work of developing a new and great industry for California.

A number of elements are essential in the rice business. These are soil, irrigation water, cultural methods, varieties, climatic conditions, rotation of crops, prices—all of which determine yields and profits.

These subjects will be discussed as the Cultivator sees the situation now. It must be understood that there will be those who do not agree with all of our observations—and it must be also understood that the industry is in a state of evolution and practices that seem to be right in the light of present information may be found radically wrong later.

Soil

Practically all of the rich and heavy clay and silt soils of the Sacramento Valley are suited to rice growing as far as containing a sufficient quantity of the elements of fertility is concerned. If they can be handled so that these elements can be made available to the plants they will produce many profitable crops before commercial fertilizers will be necesary. The difficulty will be in getting and keeping the mechanical or physical condition that permits the bacterial action that liberates these elements of fertility. The soil must be plowed and worked when the moisture content is right; if too wet it dries in brick-like lumps; if too dry it breaks up in rock-like chunks that are hard to work into a seed bed. And when these chunks are broken down they do not granulate as mellow, moist soil does, but form dust and smaller chunks which run together and get hard again when they are wet.

Next to containing fertility, a soil to be suited for rice must be capable of retaining moisture not only in the body of the seed bed but on the surface. In order to accomplish this either the entire body of the soil must be compact and of fine texture so that water does not penetrate into it readily or it must be underlaid by an impervious stratum that will retain the water in the top soil and on the surface. In the Biggs-Gridley country on the east side of the Sacramento Valley the black adobe top soil is underlaid by a yellow clayey marl that holds up the water admirably. On the west side the heavy alluvial silt and clay is so dense that it holds water up even better. In fact the problem in irrigating any other crop on this land is to get moisture to penetrate deeply enough to permit deep rooting of the plants.

Rice is being grown on lands more or less heavily impregnated with alkali, and the crop seems more tolerant of it than are some others. On heavy clay soils in which the alkali content is high when a section six feet in depth is considered—but where the stratum heavily impregnated with alkali is 18 inches or more below the surface, rice is apparently little affected by the alkali during the first one or two years, probably because the feeder root system is principally in the top six or nine inches of soil and because the soil is so dense that there is no upward movement of alkali salts by capillarity. Where soil is covered with six inches of water for several months feeder roots are compelled to stay close to the surface because that is where the oxygen is. But on land where there is a heavy coating of alkali on the surface rice has not been a satisfactory crop nor can it be expected to be until the alkali is washed off or removed by drainage.

The deep rich alluvial lands of the Moulton ranch in Colusa County are producing splendid crops of rice.

Irrigation Water

The principal water requirement for

rice seems to be that there be plenty of it. It is generally figured that the requirement is at least five acre-feet per acre for the season. Much more than that has been used on some fields this year.

Water from gravity irrigation ditches or that pumped from the Sacramento river is generally used. The cost in the Biggs country and at the Moulton ranch in Colusa County, is $1 per acre-foot per season. Estimates for pumping from wells are higher than this.

Some rice growers claim that well water is not as good for rice as river or creek water—and that if water from wells is used it should first be reservoired. Others who have made a study of the situation can find no reason why this should be so unless the well water were heavily charged with injurious salts. What the rice wants is water, and it is not particular as to the source. Well water may be colder than river water when it comes from the well, and if it came in contact with many plants while it is at a low temperature their growth might be checked, but water spread out in a thin sheet over several acres of Sacramento Valley land in a summer day cannot long remain cold.

RICE FIELD NEAR GRIDLEY, BUTTE COUNTY
Courtesy Sacramento Valley Development Association.

Most ditch water from Northern California rivers or other streams carries so little silt during the summer that this factor is a negligible one in comparing well water with stream water. If much silt was carried it would be a serious thing because of filling up ditches and distribution structures.

It is desirable to have irrigation water as free from weed seeds as possible. Water grass, as the barnyard millet (panicum crus-galli) which infests rice fields is called, tule, flag, willow and cottonwood seeds are a detriment to irrigation water for rice.

When rice is sown in a seed bed too dry to germinate the grains, it must be irrigated to bring it up. After it is six or eight inches high, or when "tiller," the field is flooded to a depth of three to six inches and the water remains until the grain is in the "dough," generally about three months. If rice is planted and up by April 15—and it takes until some time in June to get high enough to flood—the field would be flooded during a part of June, July and August and some of September, leaving the last of September to get the field dry and the harvesting well under way.

Various methods of applying water have been used; from merely keeping the checks filled and allowing none to run off, to running a big head through the checks constantly so as to give a decided circulation to the water and change the entire volume frequently. The latter system is very wasteful, and very satisfactory crops of good rice have been grown where no water is run off the checks at all, water being applied only to supply the loss from percolation and evaporation and keep the plants in five or six inches of water. One good grower permits a very small stream to pass through the checks, and this probably represents the best present practice.

The flooding is necessary because the rice plant throws out a water root system without which it will not yield seed satisfactorily.

Cultural Methods

In preparing a field for rice growing it is first necessary to check the land into borders to hold in the irrigation water. Most land on which rice is grown is very level, and rough borders thrown up with a road grader or big ridger along the lines of the contours are generally sufficient. Very little dirt is moved within the checks—only that from high spots or ridges. This sometimes leaves places where the water is a foot or more deep. It would probably be better to fill these holes somewhat so as to have an even depth of water, for the three to six-inch depth of flooding has been found to be the most satisfactory. Where the soil has simply been saturated with water and none left standing around the plants the yield has been lower. Checks in the ditches and boxes and gates to control the flow of water from the ditches to the checks must be provided. Estimates on the cost of preparing land for rice irrigation range from $2 or $5 to $25 or $30, depending on the character and contour of the land and the care with which the work is done.

Much of the land used for rice is heavy adobe or clay and must be plowed and worked when rain and other conditions permit, which is not always as the operator would like to do the job. It is a benefit to heavy land of this character to fall plow it (if crops are grown continuously without summer fallowing), so that it can "slack out" and weather as much as possible before the crop is sown, the idea being that turning the heavy soil up to the air permits the oxygen to enter and make possible greater bacterial action for the liberation of plant food. Then in the preparation of the seed bed it is a benefit to disc and harrow often for the same reason.

The land is prepared for sowing rice the same as land is prepared for barley; plow, disc and harrow in such a way and as frequently as is necessary to make a mellow and open but well firmed bed for the seed to germinate and root in. The seed is sown with a good grain drill the same as barley. From 80 to 90 pounds of seed per acre are sown, and the depth of planting is one and one-half to two inches.

When the rice grains are in the hard dough stage the water is turned off and the ground allowed to dry so as to hold up horses and self-binder. This requires ten days to two weeks or more, depending on the soil and weather. Rain at this period delays harvest. If rice is in the bundle or shock or stack it will stand a great deal of rain and weather after ripening without the grains shattering from the heads, but good crops were lost last year because they were so late that the rain prevented cutting. After binding the rice is shocked and allowed to remain in the shock a couple of days before threshing with a regular threshing machine. Drying north winds at this time are a favorable condition. Last year some stood out in the shock all winter and was threshed in the spring.

Early planting is an essential. April 15 should be the last date for planting although much was planted in May this year. The season has been unfavorable in that it has been too cold, but the long late fall may permit the saving of much of this late rice. A long chance is always taken with late planting.

Another important factor is to have a well worked, mellow, fine seed bed—as for any other grain.

Varieties

A great many varieties of rice from all over the world have been tried and are yet under trial. In general two sorts of rice are grown in the United States: Honduras or long grained rice and the Japanese with a short grain berry. Until this year Honduras has sold highest, but now there is little difference in price. Because Honduras is later in maturing

Ground Limestone
for
Agricultural
Purposes

Our ground limestone may be applied to the soil at any time during the winter season. It is especially beneficial before seeding to alfalfa, beans, peas or any leguminous or cover crop.

Lime corrects acidity; promotes the growth of soil bacteria; makes available the plant foods, nitrogen, potash and phosphoric acid; makes clay and clay adobe soils looser; makes sandy soils more compact, increasing their water holding power, and in general makes the soil a healthier medium for plant growth.

You can get immediate deliveries from us, either in bulk or sacked. Write us for further information, prices, etc.

"As TRUE as the Name"
"AMERICAN"
"Superior from Every Standpoint"
Surface Irrigation Pipe

Made in lengths of ten feet each, from a single sheet of galvanized steel, with a heavy taper collar riveted to one end, making total length 10 feet 6 inches.
"AMERICAN" pipe is made with the "lock seam" or turned joint—contains no rivets, except at collar. A riveted joint has only 70% of the strength of the sheet metal, while a turned joint has 100% or more. This means that "AMERICAN" pipe will last as long as the sheet steel. It is practically indestructible, and it is impossible to produce leakage in this pipe, as the turned seam is DOUBLE LOCKED and soldered. It is the pipe you will eventually use. Write for Illustrated Catalog.
We also manufacture steel tanks, wagon tanks, watering troughs, dipping tanks—in fact, anything in sheet metal. We make RIVETED pipe for underground use only.

FRUIT GROWERS' ASSOCIATION

(Continued from Page 487)

Whereas, this convention has been very comfortably housed and everything possible has been done for its comfort, education and success, we do hereby express our deep gratitude to the committee of arrangements, and especially to Messrs. Messenger, Wood and Jones of Los Angeles, for their untiring efforts on our behalf. We would further express our thanks to the Los Angeles chamber of commerce, the city of Los Angeles, the daily press for excellent reports, to Mrs. Thorpe and pupils and to the Birkel Music Company for music, the Roeding & Wood Company, the Germain Seed Company and the Smith & Dietrich Company for decorative plants, and the management of the Hotel Clark for the many courtesies afforded us.

Whereas, the state quarantine service has been increased from six to 11 officers during the present administration, and the present force is beyond doubt far more efficient than ever before; therefore we do hereby commend the action of the state commissioner of horticulture in increasing this force and do express our utmost confidence in the present quarantine service.

Whereas, the state commission of horticulture has recognized the grave danger of the introduction of injurious insect pests and plant diseases into California through the medium of the mails and especially since the introduction of the parcel post, and whereas, a bill providing for the inspection of all horticultural products at certain points of entry into any state, which meets the approval of the state quarantine service, has been introduced into congress and is known as the Raker bill, therefore, be it resolved, that we do most heartily endorse said bill and urge its prompt passage. Further be it resolved, that a copy of this resolution be forwarded to each member from California in congress.

Whereas, Mr. H. S. Smith, superintendent of the state insectary, and his assistants have been working with great energy and care towards the establishment of new beneficial insect parasites, and

Whereas, certain of these new parasites now appear in a very encouraging way, be it resolved that we express our complete sympathy with this work and our confidence in Mr. Smith's ability, and do hereby urge the continuance of these efforts.

Whereas, the state commission of horticulture has adopted a policy of publishing a Monthly Bulletin, which is filled with timely articles and information in a most readable form, and the appropriation by the state legislature for printing is insufficient to cover both this monthly publication and the complete proceedings of the conventions,

Therefore, be it resolved, that we do heartily approve the financing of the publication of proceedings through some outside medium, as is being undertaken for this meeting, and the continuance of the publication of the Monthly Bulletin.

Whereas, the state of California is at present expending a considerable sum of money for the collection of agricultural statistics through the office of the state statistician, and the sum of money now spent is inadequate when used in the present way for the gathering of reliable and complete data, and the state commission of horticulture is in position, through cooperation with the county horticultural commissions, to gather this data more accurately and cheaply than any other organization,

Be it resolved, that we recommend to the California state legislature that the work of the state statistician be placed under the state commission of horticulture, and that the appropriation now granted for the compilation of data as mentioned above be attached to the commission's office for this purpose.

Whereas, President Benjamin Ide Wheeler of the University of California has appointed a commission with Dr. David Burrows as chairman, to prepare a measure to be submitted to the next California legislature, providing for a system of state colonization and also for a system of state rural credits, and the farmers and fruit growers of the state feel deeply concerned in such measures, believing that if wisely enacted and properly administered they must materially add to the welfare of the commonwealth and its people, therefore, be it

Resolved, that the thanks of this Fruit Growers Convention be hereby extended to President Benjamon Ide Wheeler and to the commission appointed by him to prepare the desired legislative measures, and that the hope is expressed by this convention that such measure will meet with the hearty and earnest support and consideration of the members of the coming legislature.

* * *

In addition Mr. Russ D. Stephens presented a resolution urging approval of a recording thermometer and its use in refrigerator cars in transit from the coast to eastern markets. There has been some contention between fruit shippers and carriers, and the fruit shippers wish to be sure proper icing and proper care is given. A recording thermometer, which will make a correct record of temperatures and not be influenced by the jarring of the car, is now offered to the shippers, and some of these wish a test made. The resolution adopted, however, suggested only that such a trial may be made.

Hale, the Peach Man

The feature of the convention which called for closest attention and greatest interest were the addresses by Mr. J. H. Hale, peach grower of Connecticut and Georgia. Mr. Hale has grown peaches for 47 years and counts his acreage in peaches by the hundreds. Mr. Hale reviewed a bit of his earlier experience in farming and especially called attention to one incident in his life when a quarter of a century ago he came to California, at which time he made suggestions as to pruning orange trees and was told they were never pruned, but now observed from present-day practices of orange growers that he had opportunity to say, "I told you so!" We quote at some length from Mr. Hale's address because it has great interest for California fruit growers. We regret it is impossible to give even sufficient of the address made at this great convention to give readers who were not there even a faint idea of its importance. One point we regretted regarding Mr. Hale's address was that he in no way made reference to the new peach which is the result of his selection from many seedlings. This peach has been called the J. H. Hale peach, and while in the course of his address he referred only to the Elberta and the Belle of Georgia as the peaches which were supreme in the markets of the East, we asked him personally as to his estimate of his own peach, or rather the peach which bears his name. His modesty prevented him from saying very much regarding it other than that for his own table and as a profitable fruit he very much preferred the Hale peach to any ever grown.

We also interviewed Mr. Parker Earle, a veteran peach grower now retired and living near Los Angeles, and Mr. Earle said it was the superior of any peach he had ever seen.

The Hale peach has been fruiting in the East for twelve years. As to its behavior in California there is little opportunity to judge excepting that the fruit of a few trees which bore in their second summer's growth at Yucaipa, above Redlands in San Bernardino County, was magnificent.

With this reference to the Hale peach we will make extracts from

J. H. Hale's Address on Peaches Along the Atlantic Coast

We have grown peaches on the Atlantic Coast for family supply since the early settlement. Commercial peach growing there is over three-quarters of a century old, and when I was a small boy it was thought that God had set aside (they did not put it just that way) a few special regions where peaches would grow. Some portions of New York and New Jersey and a little bit out in western Michigan were supposed to be the only regions east of the Rockies where peaches could be grown, just two or three favored sections. By the way, that favored section theory is being wiped out; there are no special regions now for growing any kind of orchard products. You can today produce a great deal more than was ever dreamed of. In the particular peach growing regions where peaches were planted on a large scale they grew corn or wheat between the rows for the first few years. They practiced moderate cultivation, no pruning. When harvesting came everything was gathered at one time and put in baskets or crates, without any grading or sizing, and shipped to market in the crudest way. They had no refrigerator cars in those days. The belief at that time was that there was a single peach season of a few weeks in August and the first week in September, and that was all there was to it. The peaches were inferior in size, color and quality. There was no system of packing or marketing. They were shipped in bushel baskets, in market baskets or hampers such as are used for vegetables. I know of barrels being made to ship fruit in, 50-gallon barrels. The peaches arrived in the market in some kind of condition, sometimes. In a later day they used shelved cars in which they put the baskets upon the shelves, four shelves high, the baskets being without covers. While those cars were on the road many of the peaches were overturned and the fruit damaged to such an extent that on arrival from 30 to 50 per cent had to be dumped. They picked them out of the cars, piled them on peddler's wagons, and distributed them as best they could.

This had run on for a great many years. Then something happened. Some of the people in the northern part of the state of California began to grow peaches. You could not eat them all, of course. So you began to ship those peaches east. They arrived in fair condition. They were not very eatable, but they looked well. Don't laugh, that is no joke. Now these peaches arrived in the East in June and July. Nobody had ever seen a peach in July and it changed the idea that peaches could only be eaten in August or September. It taught something else, and that was grading and packing. We had very good peaches in the East, but the work of handling and packing was very inferior. We thought you were very far away, that you could never do the trick to any extent, but you did send, and in quantities, and in attractive packages. I don't know that I have ever thanked you, but I will now thank you for giving us a great idea which we have copied from you. We have copied and copied largely. In fact, you Californians helped in a way to revolutionize peach growing on the Atlantic Coast.

In Georgia

About this time a couple of men in Georgia who were growing some of the earlier varieties of semi-cling peaches constructed a refrigerator on wheels something like a big safe that would carry a couple of hundred pounds of ice and six bushel crates of peaches. They brought ice from 250 miles away and shipped it back in these refrigerators, arriving in market some two or three days later. By steamer it took six days to reach New York from Georgia. These peaches usually arrived in fair condition. That was the start of the business on the South Atlantic Coast.

A little earlier I began planting in Connecticut. We were far north, out of the peach belt, but we started the business there. One of the first things after getting the orchard under way was to see what others were doing.

The next great forward move was fruit planting in Connecticut. I planted a commercial orchard with 2000 trees. Now there are millions of trees in the state. There are also hundreds of thousands and possibly millions in western states and in many other states running up even to the Southwestern corner of Maine. The peach territory has extended almost from the Atlantic to the Pacific and from Maine to the Gulf.

New Varieties

The next great forward step was the origination of the two great commercial varieties of today—the Elberta and the Belle of Georgia. It is a singular thing that the two great commercial money-making peaches today that compare with your navel orange in importance—the Elberta and the Belle of Georgia, one a yellow and one a white peach—originated from

The Lawn and Flower Garden

THE CALIFORNIA GARDEN

Written for California Cultivator

By Ernest Braunton

DYNAMITING soils is becoming quite universal, and through this practice large areas once considered worthless for field and orchard crops or for park purposes are now being reclaimed, planted, and successful results obtained. In Balboa Park, San Diego, where tens of thousands of holes for trees have been blown out, involving the use of tons of dynamite, plant life shows a greater growth than when planted elsewhere under normal soil conditions. At the annual convention of the California Association of Nurserymen, John G. Morley, Superintendent of Parks in San Diego, was asked to describe methods and materials used in his reclamation work on large areas where there is practically no soil or where it is very shallow and underlaid with hardpan, adobe, cobblestones, etc., and where road plows attached to sixteen horses or traction engines could not tear up the "foundation of the World." We quote the following from Mr. Morley, trusting it may be of practical use to many, as the same methods and materials are being used in Los Angeles and elsewhere in the planting of gardens, street trees, etc.:

FAN PALMS ON THE GROUNDS OF THE TULARE COUNTY COURT HOUSE AT VISALIA

THE DATE PALM IS HARDY AND MAKES A MOST ORNAMENTAL POTTED PLANT

"When you stop to consider that the holes for two-thirds of the trees and shrubs in Balboa Park were drilled and blasted, cleaned out, and good soil and fertilizer placed therein before planting could be done; that even on large sections of the lawns the surface was shot before grading and seeding could be done; that over large areas closely planted to trees and shrubs, the whole ground was dynamited so as to provide for root action, you can readily see the expense of the work before results could be obtained. These conditions existed even in the area where the exposition will be held, and when you visit Balboa Park and the exposition grounds and see the results of the work, I am sure you will be surprised, for you will see hundreds of thousands of trees and shrubs growing luxuriantly in ground that was once impossible of cultivation.

"In our work we have used chiefly No. 2 dynamite, that is 40 per cent, having had better results than with the 25 per cent or by using black powder. We find that the 40 per cent shatters the ground better and there is not the tendency to fall back in place as with the 25 per cent or black powder. Hammer drills have to be used in most of the work, although we do sometimes strike a soft place that can be drilled with an auger. The holes for small trees and shrubs are drilled from three to five feet deep, according to conditions, and from two and a half to six sticks of dynamite used for each hole. This shatters the ground for about seven feet. After the blasting the hardpan and stone are removed, good soil and manure filled in, then flushed with water under pressure to fill all the spaces. After it is well settled the holes are filled to grade and the planting is done.

"When large trees, shrubs and palms have to be planted, it is frequently necessary to drill from five to eight holes from six to eight feet deep, and from 20 to 40 sticks of dynamite are used, all hardpan, etc., removed, good soil and manure placed in the bottom of the holes and these filled with water to settle before planting. This is expensive work, but has to be done to get the required results. Where all the area to be planted is blasted, the shots are placed about five feet apart each way. After shooting, the ground is plowed and the worst of the hardpan and larger stones removed, and the ground settled by sprinklers closely set, leaving them about an hour or more at each place. After a few days the area is graded and the planting done. Where new roads and walks are being built, whatever good soil is found therein is utilized on the planting areas, and the hardpan removed from the planting areas is used to surface the roads and walks."

Tree Peonies

Government plant explorers who have visited China readily declare that tree peonies (Paeonia moutan) should thrive in the semi-arid southwest where the herbaceous peonies so common on the eastern coast do not thrive except under special conditions. Local experimenters have found that a very deep and free sandy loam, with the addition of leaf mold, makes an ideal soil for this class of peonies and that if such soils are kept moist at all times, yet never wet, the tree peonies may be grown to perfection in local gardens.

Divide Perennials Now

Shasta daisies, phlox, and a host of herbaceous perennials are now past blooming and in a somewhat dormant condition and may be divided and reset. Last November the writer had many sorts moved and 200 young Shasta daisies were made from one dozen old plants. These latter started to blossom in February and kept up continuously until October. In eight years growth of these flowers, involving four removals, the plants have never before responded with such vigor, therefore it is evident that now is a splendid time to divide and reset.

Garden Millipedes

Millipedes, erroneously called "thousand-legged worms," are a great pest in any garden, for while they feed largely upon decaying vegetation they are not slow to attack any plant organism, more especially roots and bulbs. Where they are common it is better to poison them—if poison may be safely placed where children, domestic animals, birds, etc., will not come in contact—with a bran mash. Use a total of ten parts—one of Paris green, two of sugar, and seven of bran. shorts, cornmeal, or any old "breakfast food." To drive them from the soil use one ounce of bichloride of mercury in ten gallons of water. This will cause any worm or insect in the soil to move on to the next place.

Dwarf Cocos

The hardiest cocos palms we grow belong to the dwarf section, not to the lofty Cocos plumosa section of the family so popular throughout Southern California. These dwarf hardier types come from nearer the south pole than the plumosa section of the genus, hence are native to almost temperate climes. The correct name of the species used here is in some doubt. By some quite competent authorities it has been referred to Cocos eriospatha and may be a variety of that species but is not the type.

A most valuable paper on his experience and success in growing the potato was read by E. H. Phreaner of Placerville. He called attention to the importance of clean seed grown in high altitudes and outlined a plan for field inspection to produce healthy seed by eliminating the weak and diseased hills during the growing season. He also impressed the fact that commercial fertilizers must be used for maximum yields.

The fungous diseases of the potato were discussed by W. V. Shear, the government specialist in charge of the potato experiment station at Middle Island in San Joaquin County.

The fungus diseases, rhizoctonia and fusarium wilt, were described and good cultural methods urged as the principal control treatment. A University of California bulletin covers this topic fully, and any specially interested should apply to Director of Experiment Station, Berkeley, California, for it.

Wm. Garden, horticultural commissioner of San Joaquin County, discussed tuber moth, eel worm and other insect pests and assured the convention that their control was possible and would be accomplished.

The potato industry on the Pacific Coast certainly has a large and bright future.

Small Fruits Vegetables

THE SPECIAL POTATO PROGRAM

Written for California Cultivator
By Sacramento Valley Contributor

ANOTHER enthusiastic and surprisingly well attended potato meeting was held as a part of the big Fruit Growers' Convention.

Dr. Cook belives that the mission of the state commission of horticulture includes the care of the potato interests, and in him they have an able champion. As president of the West Coast Potato Growers' Association he is determined that everything possible be done to place Pacific Coast potato growing on the highly profitable basis that it will be when all of the problems connected with it are understood and under control.

It was particularly fortunate that Hon. E. H. Grubb, the great potato authority, arrived from Europe in time to take part in the potato session. In him Dr. Cook has an enthusiastic co-worker. He impressed upon the growers the imperative need of rotation of crops, preferably with the potato as a crop one year in a four, five or six year rotation, with grass and grain as alternate crops. He particularly emphasized the value of grass roots in maintaining the soil in a healthy condition for potato growing and cited instances in Europe where fields, in disease infested districts, have been kept clean for years by the sowing of grass immediately following the digging of potatoes and never growing a crop except on land where sod is turned under and worked into the soil in the preparation of the seed bed for the potatoes.

He also called attention to the fact that in Europe in the past four years practically all big successful growers are discarding late varieties that require a long time for maturing—say 120 or 130 days—for the earlier sorts that mature in 90 to 100 days after planting. This is because the longer the potato is in the ground the more chance for disease.

Another valuable lesson brought from Europe by Mr. Grubb is further testimony on the practice of using nothing but good-sized whole seed. Many of the best growers in England and Scotland use 2000 to 3000 pounds of seed to the acre as against 500 to 700 pounds of cut seed per acre as is the custom in many sections here. The whole seed, with an abundance of stored-up plant food, makes a vigorous, healthy plant and its planting far exceeds in result the planting of a smaller piece of seed. And where earliness is an object the seed is sprouted before planting, and a vigorous, well greened sprout developed before planting. The furrows are then opened out and the sun has a chance to disinfect the soil somewhat before the sprouted seed is dropped. Two to three weeks is gained by this start in sprouting over seed planted unsprouted.

"And with better methods and larger yields we will produce potatoes of higher quality," said Mr. Grubb—"all of which will cause our people to more greatly appreciate and use this great food crop. At present our people consume only two and one-half bushels of potatoes per capita per year, while in Europe the consumption in various countries is from five to ten bushels per capita."

BEAN GROWING

Written for California Cultivator
By H. Culbertson

I am asked to say something on this subject as applied to sections some distance from the ocean. El Cajon Valley, where the writer has had his experience, is less than 20 miles from the coast line. There is a range of hills about 1000 feet high between the valley and the coast, the valley itself having an average elevation of about 500 feet above sea level. In this locality we are subject to higher temperatures and less humid air than the coast. Bean growing has not proven profitable as a rule. The tests, however, have been on spring plowing just before planting. This has not proven sufficiently profitable to encourage a continuance of the business. The writer's experience is that we get moderate returns on pink beans when we use the same methods as the coast growers, that is, plow early in the winter and keep the ground well cultivated. Plant early and they mature before the real warm weather begins. This means to plant in March as a rule and grow without irrigation.

Beans do well with irrigation planted almost anytime. Early planting with one irrigation gives very good results. We would emphasize the early winter plowing and cultivation up to the time of planting. Give good cultivation after every rain, or if the ground gets well compacted replow it. This treatment retains a large part of the rainfall and stores available plant food to start the young bean plants with energy.

In a general way it has been our observation that the coast climate as it affects bean growing varies much in distance from the coast. If the coast has nearly an east and west trend, as in part of Ventura and Santa Barbara Counties, the peculiar conditions favoring bean growing reach much farther back from the coast than where the coast line is nearer north and south. They are also affected by the hills that may be high or low near the coast.

There is a locality in San Diego County where good corn is regularly produced without irrigation a few miles from the coast. In many other localities the same distance from the coast the same treatment would be a failure.

As one travels along the coast a great difference is observed in the long trailing moss that hangs on the trees. In some places in Santa Barbara and San Luis Obispo Counties the trailing moss hangs on the trees 15 miles from the coast, in other places it hardly grows even on the coast. Apparently it is largely a question of moisture in the air; if the air is humid and the temperature not too high the soil moisture is not exhausted. A dry air with extra heat exhausts the soil moisture beyond the limits for large yields without irrigation.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

J. H. HALE

One of the greatest pleasures of the convenion week just closed in Los Angeles was the meeting of such great minds as that of J. H. Hale, the peach grower. For almost a life time this man has been growing peaches. It has not narrowed him, however, for he is big and brainy, and with it all, modest beyond most men. This modesty prevented his giving notice to the peach which Parker Earle says is the greatest commercial peach yet produced, that is, the one bearing J. H. Hale's name. Mr. Hale in his address referred to the Elberta and the Belle of Georgia as being two of the greatest commercial peaches known today. From an eastern standpoint, perhaps from a California standpoint, he might well have put the Hale well before all others. Both of his addresses were listened to with most intense interest by all at the convention.

MORE DISCUSSION

Many times during the recent convention at Los Angeles did we hear requests for more opportunity to discuss questions brought out by addresses. The program was too full, and as a rule the addresses were too long. Had there been half as many we believe the results would have been better. It is not to complain that we write regarding the program, but to suggest changes in the future. So many questions come to the orchardist when he is facing big men that he wishes to ply them with questions, and from the interest taken in these proceedings we believe the attendants got greater help from the discussions than from the addresses themselves. Of course, it must be admitted that some with a hobby to ride will take advantage of such opportunities, and in endeavoring to ask a question present an argument almost as long as the address made by the speaker on the program, but these people may be easily called to order and the convention kept within reasonable bounds in such round-table discussion.

HARD WORKER

After a registration of some 1200 had been counted up at the State Fruit Growers' convention, those who had worked hardest in arranging for it and conducting it went home with a feeling of gratification, for it showed plainly that by long odds it was the largest convention yet held in the state. It takes much work to get such a convention into running order and see that all sessions come through on schedule time. But hard work is just what State Horticultural Commissioner Cook revels in. One criticism we heard of his manner of conducting the convention was that Dr. Cook was such a believer in hard work that he was holding us to it at the rate of 12 or 14 hours a day. The sessions began soon after 9 in the morning and there was practically a continuous performance until 10 or 11 at night.

Nor is this method of work confined to convention week, for we believe the entire force of the state horticultural commission is one which revels in long hours and hard work. The office at Sacramento was never on as good working basis and its documents and books so accessible as today.

LEGISLATION

The report of the committee on legislation which was made at the recent Fruit Growers' Convention, and which appears on another page, indicates only faintly the work done by the legislation committee. There are many conflicting interests which have to be harmonized before better legislation which will be acceptable to all can be suggested. The ochadists will have the largest interests at stake and will doubtless be the first to be heard in the matter. Nurserymen, who have been so seriously handicapped by the various and diverse ordinances passed by the different counties in the state, are sincerely hoping for some more uniform system of inspection and quarantine. The commissioners may be regarded in the light of servants working for the interests of the growers and nurserymen, but their work at law enforcement has given them an experience which is valuable and allows them the right to speak their views on proposed legislation. It is to be hoped that such a large number of bills will not be presented as at the last session of the legislature. There was such a mass of stuff that nearly all of it had to go to the waste basket. Growers should unite before the session is called, next January, and present the few measures necessary and bring pressure to bear that will give the growers of the state protection and opportunity to accomplish better results.

THE WOMEN'S SESSIONS

The women's sessions at the State Fruit Growers' convention were a success. This was evidenced by the eager questioning and discussion which followed each address. The questions were very much to the point, too, calling for practical help in details of work which proved obstacles to success. The speakers were able in many instances to give the help asked; if not, usually someone in the audience did. The sessions were live ones, business from start to finish. There was no suggestion of the Browning or futurist art club about them; what the women were interested in was accomplishment. They wanted to know how to accomplish the most, the best, and with leas' expenditure of time and labor—and how to make it pay.

We predict that future sessions will have more extended scope and bring in still more of the practical women who have done and are doing things.

Notes and reports of the women's sessions will be given in next week's and succeeding week's household department. This issue was too crowded with the special prize articles to find space for anything on the convention.

The meetings were conducted by Miss Lilian D. Clark of the agricultural extension department of the state university. The parlors of the Hotel Clark, where sessions were held, accommodated at least 150, and accommodations were taxed each afternoon.

CONCENTRATE

Just now the agricultural leaders of our state are giving serious thought to the condition of the affairs of the various associations that represent the different branches of the industry. We have a great many societies and commissions and other organizations, so many that the situation is confusing to many farmers and agriculturists who are coming to California from other states.

Agriculturally, we are in a state of evolution, in spite of the fact that we have been producing large quantities of good products for many years and that we have had societies, and meetings have been held for several decades.

California is a big state, of almost unlimited resources and variety of products. And greater intensive development is going on than ever before in our history.

We now have organizations representing almost every branch, and in some cases sub-branches of the various industries—and a wide range of activity in the organizations—from the busy, financially sound and fundamentally useful and necessary marketing organizations, like the citrus, walnut and almond associations, to the conventions that are poorly attended and supported.

In the first place an organization cannot be well supported or attended, nor can it live long, unless there is a real need for it and some definite mission for it to perform. In this state we nave many that have a real mission and are successful. But the meetings are held at different times and widely different places. This makes it difficult and expensive, both as regards time and money, for one who is interested in several different things to attend.

No one in touch with advanced agriculture questions the great good to be derived from an occasional "getting together" of those engaged in the same business or interested in the same line of work. It is offered in criticism of most agricultural conventions that a large part of the time is taken up by a discussion of "the same old subjects in the same old way," and while in some cases the point is well taken, there are always some of the big men in the business in attendance, and no one can mingle with a convention crowd and not learn much and be benefited in many ways.

Now the great question is—how can the various organizations and conventions be correlated and combined and condensed in such a way as to make it possible to derive the greatest possible benefit from them and still retain their identity and maintain and increase their usefulness in the districts where they are now located.

This is the problem that several of our great minds are now at work on, and we hope for recommendations that may be as nearly universally satisfactory as is possible.

FOOT AND MOUTH DISEASE

Live stock men in the United States have been aghast at the sensational spread of the foot and mouth disease in many of the greatest live stock sections of the United States. It is now located in more than a dozen states and Pacific coast stockmen are startled to find that it is reaching as far west as Spokane. This report, however, comes only as we go to press and we hope it will not be verified. States now under quarantine include Michigan, Indiana, New York, Maryland, Illinois, Wisconsin, Iowa, Pennsylvania, Ohio, Massachusetts and Rhode Island. From all these live animals (exclusive of horses) may not be shipped out. One of the serious phases last week was the discovery of many infected cattle in the Chicago stockyards, this hastening the order for entire cessation of receipts and shipments at that point. More than 7000 men have been thrown out of employment by the stockyards quarantine in Chicago. It is feared the scare may induce live stock people to throw half prepared stock on the market and break prices. The department urges that this be not done but that greater care be observed in moving cattle from sections which are not quarantined.

The former outbreak in this country was quickly suppressed by the department of agriculture, but the present one seems to have swept beyond all control and with such great rapidity that practically all the forces of the bureau of animal industry of the department of agriculture have been unable to cope with it. At first rumor said that the department was not doing as efficient work as was done some years ago, but practically all comment made now is that it is taking a strong hand and shippers even maintain that the quarantine is altogether too rigid. But that is impossible with such a dread disease. The effect upon the meat packing interests is temporary, but already some of America's best breeding blood has been destroyed, for the stock of some of the breeders who have given greatest attention to pure blood animals have been within the path of the disease. Packing interests and all breeders should aid in every way in the campaign that the department of agriculture is making.

Agricultural Notes

Over 76,000,000 pounds of raw sugar was imported from Cuba through Galveston, Texas, in the year 1914-1913.

The grapefruit crop of Florida is about normal. Much of the fruit is smaller than last year and is ripening slowly.

The United States is now receiving pineapples from the Azores as the European market has been closed to this product of the islands.

Agricultural News Notes of the Pacific Coast

Northern California

The olive harvest of the Anderson Valley, Shasta County, is unusually good this season, at least 40 per cent larger than last year.

Yuba County is increasing its citrus acreage by large plantings of both oranges and lemons, and nurserymen in that section are rushed to fill orders.

The Sonoma County Grape Protective Association is advising grape growers not to be in too great a hurry to make settlement for their 1914 crop.

The first shipment of Australian butter for the season, comprising in the neighborhood of 27,000 pounds, was received at San Francisco early in the month.

Registered Poland Chinas for the foundation of herds were recently bought by H. E. Wilson and P. R. Cox of Butte City, Glenn County, from A. M. Henry, Farmington.

As a result of early rains much plowing and seeding is being done in Stanislaus County. It is anticipated that some 3000 acres will be planted to alfalfa in the Oakdale district.

It is reported that the Hawkins dairy herd at Orland, in Glenn County, is producing better than $12.00 per cow per month. The cows are being fed alfalfa, rolled barley and oil meal.

R. C. and J. W. Jesse of Glenn, Glenn County, have three-year-old almond trees that produced 12 pounds of nuts per tree this year. Many almond trees are being planted in this vicinity.

A farm adviser for Glenn County is practically assured. James Mills of Willows, and G. H. Hecke of Woodland have recently addressed euthusiastic meetings, and farmers all over the county are joining the farm bureau.

The 80-cow herd of Holsteins recently brought to the Delevan tract of the Sacramento Valley Inrrigation Company from Wisconsin by the Roeber Company is doing well in its new home. At the head of the herd is a bull from one of the best herds in the east.

Aralia de Kol, world's champion 12-year-old milk and butter producing cow, has died of milk fever. This Yolo County Holstein was the first cow in the world to produce over 28,000 pounds of milk in a year, and was the first 12-year-old to give 1142.32 pounds of butter. The performances were accomplished in 1912.

Last year's rice crop in California was 150,000 bags of 100 pounds each, valued at $300,000. The 1914 crop is now being harvested. It is estimated that it will amount to between 550,000 and 600,000 bags, worth about $1,250,000. The farmers are having some difficulty in financing their crop and in finding sufficient storage room.

Yolo County is becoming a decided factor in the alfalfa seed production of the state. One shipment recently made to Central and South America by way of the port of San Francisco aggregated over $10,000 worth of seed. This is the largest shipment of seed made from Woodland in many years. The growers received an average of 10¾ cents per pound.

Central California

Government forest rangers will carry on a vigorous fight against the pine beetle throughout the winter.

The Woodlake section of Tulare County has had a good crop of chestnuts this year which show exceptionally fine quality.

The Terra Bella Fruit Growers' Association has sent out its first shipments of canned tomatoes labeled as Terra Bella pack.

A two-year-old Holstein heifer, Stratford Lazon De Kol 2nd, was sold at the Hanford fair for $1,000 to J. G. Fakes of Patterson.

Farmers of Hickman and Waterford districts in Stanislaus County met recently for the purpose of forming a branch of the farm bureau.

Acording to the annual report of the directors of the Fresno County Agricultural Association the district fair this season realized a profit of over $2,000.

The shearing of 100,000 sheep has just been completed at Waterford, Stanislaus County. It is estimated that 50,000 sheep are held awaiting better prices for wool.

Estimates made of the coming orange crop of the Tulare district place it at 5000 cars. The crop is not so heavy on the trees as last season but the new acreage just coming into bearing will bring up the total to practically the same as that of the season just closed.

The annual meeting of the Lemon Grove Fruit Growers' Association was held on Saturday, October 31. The following directors were elected: T. F. Bryan, C. B. Vogdes, John Campbell, Wm. M. Doubleday and H. S. McLean. The manager of the association is A. V. Jester.

The Associated Raisin Cmpany has issued a statement of its financial condition up to September 30, showing the company's total assets as two million and a quarter. Manager Madison reports the marketing very satisfactory considering the weak demand for other dried fruits.

Monterey County potato growers met at Salinas recently to consider the organization of an association and adoption of a label or brand for Salinas Burbanks. The immediate occasion for this action was the circulation of reports that inferior potatoes from other sections were being marketed as Salinas grown.

The girls employed at the Fresno Fruit Growers' packing house struck for increased wages recently. They claim that on the basis of four cents a crate they could only make from 60 to 75 cents a day, owing to poor condition of the fruit. They particularly found fault with the poor quality of Emperors, which necessitated much sorting.

The West Coast Potato Association was formed at the recently held Emergency Potato Convention at Stockton. State Horticultural Commissioner A. J. Cook was elected president and Wm. Garden of Stockton, secretary. An invitation is extended to potato growers of Oregon, Washington, Idaho, Utah, Nevada and British Columbia to join the association.

Southern California

Ventura County estimates her bean crop at a million and a half sacks.

Beekeepers suggest as an addition to "Buy a Bale of Cotton," "Buy a Can of Honey."

Walnut deliveries in the Santa Ana district are practically finished. One hundred and twenty-nine carloads have been shipped to date.

The Southern California Sugar Company's plant at Santa Ana has just finished the season's run, showing a total of 50,000 tons of beets.

The Pomona district disposed of the last of its Valencias the last week of October. In some seasons all Valencias have been marketed in this district by the first of October.

A canvass is being made of beet growers of Talbert, Artesia and other beet growing districts of Los Angeles and Orange County to induce them to grown their own sugar beet seed.

At a meeting of the West Coast Potato Association held at Stockton the following officers were elected: President A. J. Cook, vice president I. L. Borden, secretary Wm. Garden.

Clexico is sending out a call for cotton pickers. Two thousand will be needed to harvest the crop. Inexperienced pickers, however, will not make more than a dollar a day until they become accustmed to the work.

The Hemet Fruit Association shipped 30 tons of cured fruit to Havre, France, last week. This is the first foreign shipment made by this association this season and was sold subject to payment before leaving New York.

Dr. Webber of the Riverside Citrus Experiment Station addressed the Pomological Club of Claremont at its meeting last Saturday. His subject was the fertilizer experiments which have been in progress at the Riverside station.

The Hog Raisers' Association of Imperial Valley met at Holtville recently for the discussion of problems pertaining to that industry. A representative from the bureau of animal industry gave a demonstration of the method used in hog vaccination.

Refrigeration rates on carload shipments of deciduous fruit from California points to Denver, Chicago, New Orleans, Kansas City, St. Louis, Philadelphia, New York and common points have been declared reasonable by the interstate commerce commission.

California bee-keepers have just completed gathering the 1914 honey crop. According to the bureau of crop estimates of the United States department of agriculture, the yield per colony of bees was 75 pounds. In 1913 the production per hive was 36 pounds.

Los Angeles bankers will raise a pool of $500,000 to alleviate conditions affecting the cotton raising industry of Imperial Valley. The Los Angeles bankers declined to cooperate in the national movement because they considered they had a local situation to face, and that the interest of the Imperial Valley cotton raisers should demand first attention.

The Coast

Farmers of Chandler, Arizona, are going to experiment with plantings of sugar cane this year.

Berry growers of Opportunity, Washington, are discussing the erection of a box factory.

Hop growers of Oregon, Washington and California plan to form a Pacific Coast Hop Growers' Association.

Thirty thousand head of cattle will be shipped from the Pecos Valley of New Mexico during early November.

The attendance at the college of agriculture of the university of Arizona is 30 per cent larger than last year.

Greenacres, Washington, is a center where are being assembled carloads of apples to ship to war sufferers in Belgium.

Oregon's minimum wage law will be brought before the supreme court on December 7 for decision as to its constitutionality.

The agricultural demonstration train conducted by the university of Arizona in cooperation with the railroads will soon start on its fall trip.

From North Yakima, Washington, comes the report that thousands of boxes of apples that in an ordinary year would be marketed will not be picked.

The North Pacific Fruit Distributors has received over $1,000,000 from the central selling agency from collections made on the first cars of fruit shipped for the season.

Shipments of cattle from northern Arizona are now admitted to Mexico without health inspection. This is owing to the careful work of the state veterinarian of Arizona.

The Yakima Valley of Washington is now shipping out 400 to 500 carloads of apples per week. This movement, it is expected, will soon end and buyers will devote their energies to disposing of the enormous holdings now in storage.

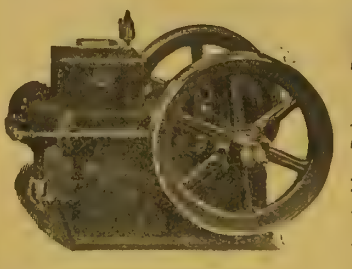
By a recent ruling of the bureau of chemistry potato growers and firms handling potatoes will not be compelled to weigh and tag each bag before shipping, this because of the practice of selling the potatoes by weight exclusively and not by sack.

The fourth annual Pima Indian fair is being held at Sacaton, Arizona. The Indians are taking a greater interest in the fair this year than ever before, and their exhibits are said to be of a quality that will make some of their white brothers sit up and take notice.

The agricultural extension service of the University of Arizona is endeavoring to interest dairy farmers in testing their cows to find out which pay and which do not. It is estimated that for only 15 cents per cow per month farmers can have accurate tests made.

A cider mill in the Hood River Valley of Oregon will this fall undertake to manufacture and test on the retail market 1000 gallons of concentrated cider. Experts of the United States department of agriculture have perfected a method of concentrating cider to one-fifth its usual bulk without destroying its fresh flavor.

The MASTER Engine



ALPHA GASOLINE AND DISTILLATE ENGINES have the new built-in, gear-driven, gear-timed magneto, which is guaranteed for the life of the engine.

Starts Easy No Batteries No Coils

THE ALPHA ENGINE starts on the magneto without turning over, requires no cranking.

TAKES LESS FUEL AND OIL and delivers more power because of special features and design.

PUT YOUR POWER PROBLEM UP TO US. Our Engineering Department is fully equipped to handle it, and will help you and save you money.

GAS, GASOLINE AND DISTILLATE ENGINES for every purpose.

FOOT-AND-MOUTH DISEASE SPREADS

By Richard Hamilton Byrd

THE experts of the bureau of animal industry of the department of agrculture are concentrating their efforts on the suppression of an epidemic of foot-and-mouth disease among cattle, the spread of which has been so swift as to prompt federal quarantine against shipments of cattle out of ten states—New York, Pennsylvania, Maryland, Ohio, Indiana, Illinois, Iowa, Massachusetts, Michigan and Wisconsin. All interstate as well as intrastate shipments of cattle, hogs and sheep in these states are absolutely stopped by the agricultural department's quarantine. Doubtless other states will be found to have infected herds, and if so they will be quarantined. At this writing cases of diseased cattle at Como, Mississippi, are suspected of being the foot-and-mouth disease, and are under investigation. The presence of these suspected cases became known through a letter addressed to the secretary of agriculture. The owner of a herd at Como stated that for some time his cattle had been afflicted with sores about the mouths and hoofs, and in treating them he seemed to have contracted the disease himself. The symptoms given were those of foot-and-mouth disease.

The seriousness of the epidemic of the foot-and-mouth disease and the necessity for use by the department of agriculture of funds set aside for other purposes have been laid before the president by Secretary Houston. The secretary told President Wilson that, as a result of the epidemic, it will be necessary to increase the estimates of expenditures for the department now being drawn up and which will be sent to congress next month. He said the department believed it was in control of the situation, and that the food supply would not be very seriously affected.

Even if no further areas are added to the quarantined section, it will cost several million dollars to stamp out the disease, since the only effective method is to kill and bury or burn all affected animals. The indirect loss, however, will be much greater. Only the most drastic measure of immediate slaughter gives any hope of eliminating the disease, even rigid quarantining but partially checking its spread, since the germs may be carried by animals and even pigeons to a distance of scores or hundreds of miles.

The foot-and-mouth disease is practically unknown to American stock raisers, therefore it has not been generally recognized, which accounts for the foothold it has gained; nevertheless, the foaming at the mouth and the ulcers appearing on the udders and feet of the animals attacked are unmistakable signs to those aware of the presence of the disease in the United States, and the secretary of agriculture urges the immediate report to him of any suspected animals or herds. Indeed, prompt action in such cases, even if involving a pecuniary loss to the farmer or the shipper, rises to the height of patriotism since the general spread of the disease would be a tremendous national calamity. In a former outbreak of the disease in Massachusetts and New Hampshire failure to report the malady and the evident intention of some of the people to conceal it resulted in greatly prolonging the period of quarantine and rendered the work of eradication by the government much more difficult. With the present widespread prevalence of the diease such a course would probably result in its getting beyond possible control. In such an event, it is stated, the present high price of meat would not be a marker to what could be expected. Secretary Houston therefore urges every good American to report at once, by telegraph if possible, any case of supposed foot-and-mouth disease. In case of the slaughter and destruction of animals the federal government and the states pay the owner the full meat value for his animals as if in good health.

Protests of cattle owners against the rigid enforcement of the preventive measures were answered by Dr. S. E. Bennett, chief of the inspection force of the bureau of animal industry at the Chicago stockyards, by the statement that the slaughter of infected animals at a cost of $10,000,000 would be cheaper to owners of herds and the packing interests than a general spread of the disease, with the vastly larger loss it would involve. The death rate ranges from 2 to 30 or 40 per cent, with great variation in the violence of the epidemic, but the average loss to the farmer through the crippling and deterioration of the animal attacked is placed by the department of agriculture at 50 per cent.

The latest appearance of the foot-and-mouth disease in this country was in 1908, when small areas in New York, Pennsylvania, Maryland and Michigan were affected. To stamp out even this restricted epidemic involved the expenditure of nearly half a million dollars and the unremitting efforts of 575 employes, of whom 159 were veterinarians. The task today is far heavier, and if the department of agriculture can kill the present epidemic it will justify its existence many times over.

PLACE FOR SHEEP ON THE FARM

As the sheep breeding season is now opening, the United States department of agriculture urges the desirability of maintaining a small flock of sheep upon the farm. With proper care and attention, a flock of 25 or 30 ewes can be kept at very little expense, and they will prove of inestimable value in freeing the farm from weeds and adding something to the farm income. In addition to providing a considerable supply of delicious wholesome food for the farm table, there will be a surplus for sale and an additional item of revenue in the form of wool.

Many farmers make a practice of buying ewes in the fall, breeding them and selling the lambs the following summer. Such ewes can be carried through the winter on wheat and rye fields if not pastured too closely, or on clover hay with some roots and a little linseed meal. If the clover hay is not available, corn fodder may be used as roughage, in which case it should always be supplemented with bran or linseed meal. Lambs should come early and should be taught to eat as soon as they are old enough. Give lambs access to corn by providing a creep through which they can go without allowing the ewes to follow.

Ewes can be purchased at the present time at prices ranging from $3 for common, inferior sorts to $7 for good fairly well-bred ewes. For farm purposes the black-faced ewes are more popular than the others, although good results can frequently be obtained from the white-faced ones. In buying ewes, be sure that they stand well on their feet, have good straight backs and good mouths. Ewes that have broken teeth, or teeth that are badly worn down should not be bought. As a rule, a sheep has one pair of permanent incisor teeth when it is one year old; two pairs when it is two years old, and three pairs, or a full mouth, when it is three years old. A fullmouthed ewe, if the teeth are in good condition, can be used for breeding with good results, although she may be as much as five years old. Never buy a ewe that has a broken mouth, that is, with teeth that have been broken off or lost.

None but a pure-bred ram should be used. It is not necessary to have a show animal, but a strong, vigorous buck is essential. Shropshire, Oxford, Southdown, and Hampshire rams sire excellent mutton lambs, and these breeds are recommended for the farm states. A suitable ram can be bought for $8 to $20.

The two principal drawbacks to the sheep industry in the farm states are dogs and stomach worms. The dog nuisance can be obviated to a great extent by placing dog-proof fences around the pastures. The United States forest service has had excellent results in protecting sheep from coyotes and wolves by building fences constructed in the following manner: A barbed wire is first stapled to the posts right on the surface of the ground. Three inches above this is placed a panel of close-woven wire, 36 inches high, and above this two strands of ordinary barbed wire. Care should be taken to see that there are no openings between the ground and the lowest barbed wire. An inclosure made in this manner, into which sheep may be turned at night, is inexpensive, and dogs will not get through it. Most of the damage by dogs is done at night.

The presence of stomach worms is a very serious drawback. The young lambs become infested with them by eating grass to which the worms have attached themselves, the eggs being deposited by the mature sheep. It is therefore desirable to keep the lambs on land on which the mature sheep have not run, and if possible, in cases of bad infestations, to keep the lambs away from the mature sheep as much as possible.

In the farm states, the farmers will find it to their best advantage to regard the wool from the sheep as a by-product, and direct their principal attention to the production of lambs, and mutton for the table.

CARE OF HOGS AT VACCINATION

Bad results sometimes follow improper or careless methods of handling and feeding, both prior to and immediately after vaccination, in spite of the fact that clean, potent serum and fresh, uncontaminated virus were used. Among the things that can be done to contribute to good results are the following:

Feed the hogs moderately for 24 hours before vaccinating. Do not fast them, as this will cause them to be wild and hard to handle.

During hot weather, vaccinate early in the morning or towards the evening, rather than in the middle of the day, when it is hot.

The hogs should be kept in a clean, dry place before vaccination. This is better both for the hogs and for the persons who are to handle them.

If possible, group the hogs according to size. This will lessen the chances for error in estimating the doses of serum to be injected.

Provide a box or table on which to place the bottles of serum and virus, disinfectants, syringes, etc., where they will be convenient but not likely to be upset.

It is even more important that the hogs be kept clean and dry after vaccination, to reduce to a minimum the chances for infecting the needle wounds.

Get the hogs into an enclosure where they can be caught without chasing them. This should be done before the arrival of the veterinarian.

Special attention should be paid to the feeding of the hogs after vaccination. Corn should be excluded from the diet entirely for at least a week. Give reduced rations of slightly laxative feeds.

Watch the hogs carefully for at least three weeks after vaccination, especially if the double treatment has been used. If all goes well for three weeks, there is little to be feared later on.

If any hogs show signs of sickness following the double treatment, they should be isolated from the rest of the herd. Sometimes another dose of serum will save them.

If an abscess forms at the point of injection, it should be opened promptly and given a chance to drain. Very few abscesses should occur, however, if the foregoing rules are followed. —H. Preston Hoskins, Assistant Veterinarian, Minnesota University Farm.

STERILIZING MILKING MACHINES

By Lois W. Wing, Cornell University

Milking machines are expected to deliver milk free from dirt and bacteria, but in practice this result is not possible without considerable attention to the cleaning and sterilization of the machine.

The present experiments were arranged to test: (1) the efficiency of machines in producing a high grade of milk, and (2) the amount of care necessary to keep the machines in a sterile condition.

The first experiments were conducted at a laboratory and a farm near Little Falls, N. Y., in 1911. The stable was whitewashed and had a plank door, whilst the feeding alleys, mangers and gutter were of cement. No unusual care was given in keeping the stable and cows clean.

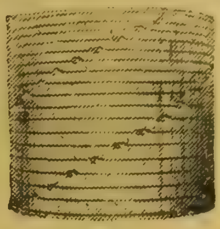
The sterilization was carried out by various methods, using brine, alcohol, hydrogen peroxide, potassium permanganate, copper sulphate, acetic acid, and hot water as germicides. Samples of milk were taken for bacterial counts each night.

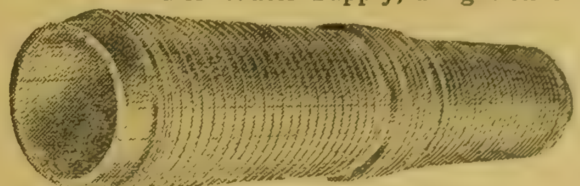
As a result of the experiments the writer concludes:

1. Brine solution, as generally used for the treatment of rubber tubes and teat-cups, does not keep them in a sterile condition.

2. Although the milking machine excludes external contamination to a marked degree, the milk may still have a high bacteria count owing to contamination in the tubes.

3. The rubber tubes and teat-cups may be kept in a practically sterile condition by the use of a salt solution containing chloride of lime.





SILOS
All sizes and dimensions made to order for your particular conditions.
This is a Photo of the 20x40 Redwood Stave Silo Manufactured and erected by us on the Sheldon ranch, Kenwood, California.
TANKS
From 500 to 500,000 gallons capacity.
Built to suit All Uses and Users. Cheaper than Metal Tanks, last 10 times as long.
PIPE
Machine Banded or Continuous Stave. For Water Supply, Irrigation or Power.
All Designed by our expert engineers. Made in our own immense factory from clear, air-dried redwood, selected from Air-Dried Stock of 40 Million Feet, which we carry at our plant at ALL times. Write Us for Prices.

Mermaid Spray Powder

FOR CITRUS AND DECIDUOUS FRUIT TREES

(Made in California)

ANALYSIS Curd Soap 50%, Bi-carbonate Sode 5.0%, Carbonate Soda 37.5%, Balance Moisture.

SOAP SPRAY An effective soap spray used in the proportion of one part of powder to six gallons of water with 200-pound pressure. Not harmful to trees or fruit if properly used.

ERADICATES SCALE

Mermaid Spray Powder will kill this form of pest when applied conscientiously with the above proportions at the right time. You will also note its effectiveness towards reducing red spider while spraying for scale.

COST A cheaper and purer soap powder that is prepared with accuracy.

UNIFORMITY Guaranteed to be at all times uniform and without lumps and to dissolve with absolutely no waste, thus saving time and money by not having your spray machine stopped to clean out impurities.

DELIVERY Promptness is our watchword. Any order placed with the Fruit Growers' Supply Company will receive immediate attention.

WRITE US TODAY

We will cheerfully give reference from Professional Sprayers and Growers throughout Southern California who have tried all other Powders and have found MERMAID SPRAY POWDER without an equal. If California can produce the goods—it is up to you. Investigate.

Contagious Abortion

Can abortion be cured, and if so how and in what length of time? Is there any way to prove conclusively that an abortion is of the infectious kind and not the result of an accident? Would you advise selling a cow that aborts to the butcher or treating her, the cow being valuable and profitable? Can calf scours (infectious) exist in a herd free from abortion?—Subscriber, Irvine.

Contagious abortion is caused by a germ that lingers about the genital organs of both male and female. The only way to determine conclusively that an abortion is caused by infection and not by an acident is by the use of the microscope and finding the germ. But should it occur too frequently in a dairy one might safely conclude that it was of the contagious kind without using the microscope. By diligent care and treatment a herd should be freed from the disease in a year or perhaps half that time. We would not advise selling a good cow on account of abortion. The one you would buy to take her place might be no better. The treatment for abortion can not be fully given in the space allowed in this column, but briefly, it consists in destroying the foetus and afterbirth by burning it, washing out the stable with strong lime water and once a day, for a week, washing out the uterus and the surrounding parts of the cow with some good antiseptic solution, as one part of bichloride of mercury or permanganate of potash to one thousand parts of water. Internal remedies are of no use in these cases. The bull should also be treated to stop the spread of the disease. The infectious calf scours is due to an entirely different germ and may or may not be present where contagious abortion is known to exist, or may be present at any other time.

Sore Mouth

Have a four-year-old Jersey cow which has a number of red pimples on the upper surface of the tongue. When not eating she spends considerable time in working the tongue in and out of the mouth as though it might be itching. She is especially active this way after licking herself.—Subscriber, Ontario.

Probably the trouble is Mycotic stomatitis which comes from eating food that has a fungus on it caused by dampness. It is only seen in the fall after the first rains. It may get much worse and affect the skin above the feet where they get damp from walking through wet grass. When it gets bad it acts very much like the foot and mouth disease that has broken out recently in the eastern states but it does not spread as that does and is less dangerous to other animals. If you have other cattle it will be best to move them into other pastures and put the ones affected in a dry corral and feed them soft feed that will not irritate the tongue. Be sure they have plenty of water to drink. Twice a day swab the mouth with a solution made by putting a pound each of alum and borax in a gallon of water.

Tail Switching

About two months ago my driving mare begun switching her tail. What is the cause and what is best to do for it?—Subscriber, Bachelor.

It may be due to pin worms in the

County Horticultural Commissioners

State Association Holds Interesting Sessions in Los Angeles

THE county horticultural commissioners of California have maintained a state association which for several years has aided in more effective work in practically every county of the state. Membership in the association is practically necessary for each commissioner, and once or twice each year this association is called to meet in conjunction with the state fruit growers' convention. All but two or three of the commissioners were at this year's session, which was of greater interest than usual because of its preceding the session of the legislature and the fact that fruit growers and commissioners have for the past two years been discussing legislative questions. Of course, there were extended discussions as to methods of enforcing present laws, and best methods of quarantining and watching after the interests of each commissioner's county, but the greater interest centered around the resolutions regarding legislation. A special committee was appointed by the commissioners to act in conjunction wtih the general legislative committee.

The special committee reported as follows:

Report of Special Committee on Legislation

This committee recommends:

First. That measures be taken to secure greater uniformity in quarantine and inspection regulations relating to shipments of nursery stock and horticultural products.

To secure this result we recommend the following addition to the law relative to the duties of the state commissioner of horticulture:

To prevent the introduction and spread of pests and diseases from place to place within the state, the state commissioner shall be empowered to divide the state into such districts as may seem necessary in his judgment for the prevention of the spread of various pests.

Such districts may be different for different pests. Such districts need not necessarily follow county lines.

The state commissioner shall make regulations governing the quarantine or the shipment and inspection of agricultural and horticultural products and plants in transit, either from one district to another district, or from one place within a district to another place within the same district, and shall issue such instructions to the county horticultural commissioners and quarantine guardians in such districts or parts of districts for the enforcement of such regulations.

Second. We recommend that a bill be framed providing for the control of the ground-squirrel pest and that such control be made a part of the duties of the county horticultural commissioners, under the direction and jurisdiction of the state commissioner of horticulture.

Third. Inasmuch as there is a possibility of legislation relative to agricultural and horticultural state commissions, which will take time to install and arrange and to test out in operation, we recommend that for the time being, and for a period of at least two years, no fundamental changes be made in the status, or mode of appointment, of county horticultural commissioners.

Additional Clause.—There shall be a standing legislative committee appointed by the County Horticultural commissioners for the purpose of investigating any defects in the present methods of the organization and to make suggestions for the betterment of the service. Frank T. Swett, William Garden, A. E. Bremner, C. W. Beers, W. Woods.

The above resolutions were referred directly to the larger legislation committee.

In addition to the serious business of the convention various commissioners visited Whittier and other nearby sections.

One proposition is to concentrate all of the state commissions—horticulture, dairying, veterinary, viticulture, etc.—under one head, in an organization similar to the United States department of agriculture and headed by a commissioner of agriculture. This plan is in practice in some states, and has many advantages. Much would depend on the caliber of the commissioner, who must be big and broad, and it would be hard to get a suitable man to accept if the position were political and the tenure of office subject to as frequent change as the governorship.

An excellent plan for conventions and the transaction of other agricultural business has evolved in Wisconsin, and it might or might not work out here. The meetings of practically all of the state organizations are held at about the same time each winter at the capital city, Madison.

The ballot for officers for the coming year resulted in the election of William Wood of Los Angeles County as president of the County Horticultural Commissioners of California, with C. W. Beers of Santa Barbara County, vice-president, and O. E. Bremner of Sonoma County, secretary and treasurer. These officers will serve until the close of the convention next year.

LIVE STOCK SANITARY ASSOCIATION

The eighteenth annual meeting of the United States Live Stock Sanitary Association is postponed. Many federal and state officials are engaged in controlling foot-and-mouth epidemic, consequently your executive has agreed it is best to hold our meeting later than dates originally announced. Notice of new dates will be given as far in advance as possible. John J. Ferguson, secretary-treasurer.

A machine in the shed is worth two in the weather. Where is yours?

HOW WE SERVE OUR PATRONS

We Do More Than Merely Sell You the Trees

From the first selection of good seed for the seedling, and the growing of the seedling under the care of experienced men, in soil adapted to its culture, through the whole process of budding and up to the point of delivering to you a perfect tree in perfect condition, Roeding's service means protection for the planter. But we serve our patrons to a still further extent. Please note carefully.

Free ROEDING'S Advisory Service

It is a very important matter to you to know just what is best adapted to your particular soil and locality, and after you have secured the best trees obtainable and have them properly set out, it is important that your orchard receives proper care. Here's where Roeding's 30 years' of experience in growing, packing, shipping and marketing extra fancy fruit steps in to help the inexperienced planter. We have a service to give to every purchaser of our trees, which means absolute protection against costly mistakes—it means advice and help in cultivation, pruning, spraying, packing, marketing, etc., to enable you to grow and reap the profits of extra fancy fruit. Remember it is the premium fruit that brings the price. All this service you get from us absolutely without cost, when you purchase Roeding trees. Write us today for further information.

CITRUS Trees

Our stock comprises all the leading varieties of

ORANGES
LEMONS
POMELOS

Avocados, Limes, Etc.

Our stock is guaranteed true to name and is grown under ideal soil and climatic conditions.

DECIDUOUS FRUIT TREES

We also carry a complete stock of apples, pears, plums, peaches, prunes, grapes and ornamental and evergreen trees of every kind and description.

Increased Production

The standard of poultry living and profit can be preserved and greatly increased by feeding

Coulson's Egg Food

When you take up a handful of Coulson's Egg Food you scarcely realize that you are looking at a dozen or two dozen eggs. But such is the case. The hen utilizes this food in the production of her eggs. It gives her the elements out of which she manufactures her product.

Coulson's Egg Food is not a stimulant—it is a food, and as such acts as an AID to egg production.

By insisting on Coulson's Egg Food—by refusing substitutes—you will be paving the way for a good yield from your flock, and at the same time giving your birds the VERY BEST at no additional cost.

Send for our free book, "Chickens." It is intensely interesting and instructive.

Poultry for Profit

THE SIDE-LINER'S SEVEN SINS

Written for California Cultivator

By Jean A. Koethen

FORTUNATELY no poultry keeper commits them all, but one is enough to cut down his profits, two may turn his feet into the path of those who never are, but always hope to be, and three—well, one doesn't wish to generalize too much, but the chances are that any three of these short-comings charged to the account of one man would be conclusive.

There are three kinds of side-line poultry keepers:

The man (more often it is a woman) in city or country who keeps a nice, thrifty flock of pure bred hens, cares for them when he can spare a few minutes from his real vocation, sells hatching eggs in season, and "extra" market eggs the year round, and salts down a nice little profit at the end of the year. I visited such a plant as this a few weeks ago. On a single half-acre a young man who is employed from eight o'clock till five keeps from 300 to 400 hens of two standard breeds. Theoretically he would do better with one breed, but he keeps each breed by itself, and seems to be very successful. His buildings are up-to-date, his runs immaculate, his scratching pens full of clean straw. His energetic young wife looks after the incubators and young chicks; they have always a string of fine birds in the show, and they told me they sold 3000 baby chicks last year. This is your real "little lander," but he does not pretend to get a living from his half-acre.

The farmer or back-lotter who keeps hens in the hope that they will pay, but who does not understand the fundamental principles which under-lie the building up of a profitable flock. This kind of poultry keeping is far too common the country over. It is due partly to the fascinating uncertainty of Mrs. Biddy's performances, partly to the dissemination of untrustworthy literature, which, in spite of successive lean years, still calls attention to the immense profits to be made by keeping a few hens in the back yard.

The man or woman who keeps hens without expecting them to pay. It is surprising how many there are in this class. They keep hens because they have always kept them, or for the sake of the fresh egg for breakfast and the Sunday fryer, or just because they like to have them around, all good reasons, but they might as well make them pay while they are at it.

The keeping of poultry is naturally and fundamentally a side line. The busy little hen seems just adapted to filling in chinks of one sort or another, especially on the farm where she can pick up her living and bother nobody. Robinson says in Chapter 3 of "Principles and Practice": "Probably over 90 per cent of all the poultry sold in the United States is produced by poultry keepers who do not make a business of poultry culture, but keep poultry on a small scale while giving their attention chiefly to some other occupation, usually general farming. . . . The staple factor in production is the farm flock, the produce of which is largely profit. The spectacular large enterprises rarely last long, and their nominal contributions to poultry production often represent only a waste and loss of money earned in other occupations.

"Permanent poultry culture is a branch of agriculture. This fact the poultry keeper and the student of poultry matters alike should ever keep in mind. It is fundamental."

I quote these words of Mr. Robinson in order to make it quite clear that while many poultrymen are successful as specialists, the great bulk of poultry products is produced by side-line poultry keepers, and that among these side-line poultry keepers the farmer stands first. This has always been true in the middle west. It has not been true in California, but it will be if the farmer sees his opportunity. The general farmer who has land for growing grain is in a position to raise poultry far more cheaply than can the specialist who raises only his green feed. A well-known eastern expert author of several books said a few weeks ago, speaking of the rise in feed prices:

"One thing is certain, more poultrymen will raise their feed, or at least a part of their feed, next year than ever before. There are two ways, and two ways only, to make money on hens. The first is, to get a fancy price for the product; the second is to raise all or part of the feed."

Here is the general farmer's opportunity. He has the land. He can raise all or part of his feed. All he needs is better methods, better equipment, better hens.

The specialist succeeds because he must. His living depends on it. He dare not neglect one jot or tittle of all the wearisome details which make up the day's round. His mind is on his work. His heart is in it. He is Johnny-on-the-spot because he must be. The side-liner fails very often because he doesn't care. A few cents more or less doesn't matter. In short we may write at the head of his list of special and fatal sins.

A Low Aim

"Hitch your wagon to a star" is a mighty good rule for anyone. It is a particularly good rule for the side-line poultryman, for if he does not aim high he gets nowhere. A flock of purebred, healthy, paying hens is a fine aim for the farmer. They will consume the waste of the farm, pay the grocer's bills, and buy new spring bonnets all round for his wife and daughter. It is an equally good aim for the back-lotter. Why should any man or woman keep a disreputable lot of mongrels "just to provide fresh eggs for the table," when they might have the same number of fine, beautiful fowls, producing eggs for the table with a surplus for the neighbors and hatching eggs to sell when market eggs are cheap?

Carelessness About Lice and Mites

This is the rock on which many a promising side-line business is wrecked. A correspondent wrote me the other day: "Do most people bother to dust for lice? Does it pay?" I had

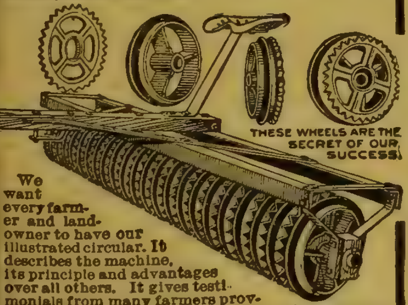
3 MACHINES IN 1

A perfect seed bed is as important as to sow or plant. The Western Pulverizer, Packer and Mulcher makes a perfect seed bed and leaves a loose mulch on top to retain the moisture in one operation. It will double profits on crops. Made in 8 sizes. 1 and 3 sections. **Sold direct to you on one year's trial. Prices, $22.00 and up.**



THESE WHEELS ARE THE SECRET OF OUR SUCCESS!

We want every farmer and landowner to have our illustrated circular. It describes the machine, its principle and advantages over all others. It gives testimonials from many farmers proving what it will do on wheat, alfalfa and other crops. It contains valuable information on how to prepare the soil for better results. Send for this circular today, whether you want to buy or not.

FOLDING SAWING MACHINE CO., 161 W. Harrison St., Chicago, Ill.

to reply that I was afraid a great many people did not "bother," but I was very sure it would pay if they did. I don't suppose a few lice do much harm, except to baby chicks, and I fancy there are very few flocks that are entirely free from these pests, but a great many lice will certainly interfere with a hen's comfort, and that means interfering with her productive powers, for nobody, hen or human, can work to advantage unless he or she is reasonably comfortable. As for mites, they are often called the worst handicap of California poultry keepers and may always be expected to infest and annoy unless steps are taken to circumvent them. No matter how clean or new your houses are they will always find them if steps are not taken to keep them out.

Keeping Too Many Breeds

The average side-liner goes from breed to breed looking for one he likes better, and keeps a few of each, I suppose for purposes of comparison. If he happens to strike an extra good strain of Rocks, then he avers and declares that the Rocks are the best layers ever and he'll have no other. If his best layer happens to be a Red or an Orpington, he swears eternal allegiance to that breed. As a matter of fact, we all know perfectly well that there are excellent layers in all breeds, and laying is a matter of strain and not of breed. The man who has Barred Rocks and is not satisfied with them should hunt up a better laying strain or else improve the one he has. He will get ahead much faster this way than by changing breeds. As for keeping several breeds at once, this is a very troublesome matter and hinders the development of any one of them. The man who hatches 200 Barred Rocks in a season ought to be able to select 20 pretty good ones for his next year's breeders. Fifty each of three or four different breeds gives him a much narrower choice.

Haphazard Methods

Haphazard breeding, haphazard feeding, hit-and-miss raising of chicks, this is what is keeping the poultry industry down, and everybody who raises any chickens at all is part of the great billion-dollar poultry industry. Why breed from the whole flock instead of selecting the hens which are really worth while? Why permit the eggs to be fertilized by a cock that a neighbor is willing to sell for a dollar, instead of sending to a scientific breeder for a bird that will improve the stamina and production of the flock? Why feed corn when you know corn is too fattening for the regular diet of hens anywhere, let alone in a warm climate? Why hatch chicks under mite-infested hens or raise them in diarrhoea infected brooders? Why let your hens get sick when a little attention to sanitation and feeding will keep them well? There is only one reason. Too much trouble to do the thing the right way. If poultry culture is anything at all it is a science and must be gone about scientifically. There are many right ways of doing the same thing, usually, and they are not hard to find.

Beginning Too Large

A large beginning often makes a sudden and discouraging ending. The victim of "chicken fever" thinks that if he can only fill his pens with chickens he will be a real poultryman. Too late he finds that it costs a dollar to raise each hen to maturity and that she is not always prompt about repaying the dollar. When I made my first ill-omened attempt to raise a lot of incubator chicks, a sympathetic neighbor consoled me with the remark, "Well, at least those that are not alive are dead." "You mean, those that are not dead are alive," I replied, not understanding his trenchant witticism, but more than once since then I have been glad when I had hatched too many chicks, that at least those that had died were dead and out of the way.

Overcrowding

Probably no one thing is more fruitful of evil results in the hen yards than overcrowding. Whether it is young chicks, half-grown stock, laying hens or breeders, the same care must be exercised to make sure that they have plenty of room. Just how much room is plenty is not always easy to say. Baby chicks usually require twice as much room when they are a month old as they do when first hatched. For houses, from three and one-half to five square feet per hen is allowed when the scratching pen is inside, that is, when the house is expected to shelter the hens in bad weather, but two square feet per hen is sufficient when the house is used only for roosting. This is for Leghorns. Heavy hens require a little more room on the roosts. For yards it is not easy to say how much room a hen needs. Some poultrymen manage with very little yard space, and some allow a good deal. I think a pen 8x30 feet allows very comfortable space for a dozen hens, but many persons would put 20 in it. The acreage required for a given number of hens is largely a question of the skill of the man who takes care of them and the breed of the hens. I know a man who keeps 1500 White Leghorns on three and one-half acres, but only an expert could keep so many hens on so little ground. I should not care to keep more than 100 Orpingtons on an acre, but I like to have spare pens which can be planted to a soiling crop and so kept clean and sanitary. It is well to remember, in planning for fowls, that the more hens you try to keep on a given piece of ground, the harder it will be to keep it clean and the more danger will there be of sickness in the flock.

Failure to Keep Accounts

I mention this sin with great reluctance, for I am obliged to condemn myself. Nevertheless, I am sure that many failures come from this neglect. The side-liner, as well as the specialist, ought to know just what his feed is costing, and how much he is netting per hen. It is a difficult matter, this putting down every cent that comes in and every cent that goes out, but it ought to be done. Exactness in every detail of the day's work is not too high a mark to aim at and it is only when we have reduced our work to such a system as this that we can be sure that we are masters of it.

LARGE RABBIT EXHIBIT

The largest exhibit of rabbits ever held on the coast will be seen at the San Francisco Poultry Show, December 8 to 13. The entries will be heaviest in Flemish, German and Belgian Giants and New Zealands, besides a fine showing of English, Abyssinian and Peruvian cavies and English lops, French lops, Dutch, Himalayas, Silver Polish, Black and Tan, Angoras, Imperial Blues and Havanas. Many valuable prizes are to be given for the various varieties. L. Regner of San Mateo will pass on Flemish Giants and all others will be judged by Arthur Petty of Burlingame. In connection with this exhibit there will be a fine array of dresed carcasses. The best methods of killing and dressing rabbits for market purposes will be shown here. The entries close on November 25.—E. J. Talbot, secretary, Mutual Bank Building, San Francisco.

ARE YOU GETTING LOTS OF EGGS ?
Conkey's

Or, do your hens lay only when eggs are cheap?
Get the eggs this winter by starting to feed

CONKEY'S POULTRY TONIC

now. It doesn't force the hens but makes them want to lay because they are well nourished and strong.

Conkey's Poultry Tonic is an all round tonic that helps nature do it's work—For this reason it is fine for every bird you own—young chicks, growing stock, molting fowls or laying hens.

Tell your Dealer you must have Conkey's—and write us if he cannot supply you. Remember, Money back if a Conkey Remedy or Tonic ever fails to satisfy you.

GET THIS BOOK—and learn to laugh at poultry diseases. It will make you an expert. Send 10c for a copy and we will enclose our Cash Value Coupon—something new.

FRUIT GROWERS' ASSOCIATION

(Continued from Page 491)

the same parent tree in the same year, a Chinese freak. I have tried to raise new varieties. They are almost always inferior. Two new varieties, the seed for which were taken from one tree, and in one year, produced two of the great commercial varieties in America today. This made possible the enormous peach planting that has taken place during the last quarter of a century. I happened to be in New York City in 1898 and there saw the first solid carload of peaches from Georgia. It set the commercial fruit world afire with possibilities. Some of us who were interested went down and looked over the field for good and new varieties. I came back and tried to settle. I never had money and I never tried to have. I talked about my plans to the produce men, the fruit men, the wholesale men, the retail men, about planting large orchards full of peaches. They all said that the trade just used a few California peaches, that they wouldn't eat peaches in July; that there was only one time when they wanted them and that was during the latter part of August and in September. They further said there was no market for peaches in June and July in any considerable quantity. But a few went ahead and began planting. Others planted farther up the coast, and still others planted, and from that has grown up a business which ships as much as 30,000, 40,000 or 50,000 carloads of peaches in a single year, sold in May, June and July. Fruit dealers, wholesalers and retailers will tell you now that the summer months are the best months.

After a good start of earlier planting in a small way in several states there began an extensive planting in the mountains of Maryland and West Virginia. They planted in the roughest land I have ever seen. Some of these mountain orchards of West Virginia were very steep and very high. They planted immense orchards and are now doing an enormous business. In Western New York and along the Lake Shore, from north of Rochester, Niagara Falls and east, there was hardly a commercial peach orchard 10 or 15 years ago, while now there are tens of thousands of acres, and the peach growing section is now extended way up into Michigan.

Get Rich Quick

But there have been too many non-horticulturists. Too many people have gone into the peach business in the East just like they went into the orange business here; people who were not horticulturists who were not lovers of fruit for its own sake. I will venture to say here that those who succeed in horticulture are those who love the trees and plants which they cultivate for their own sake, and for the beauty of the fruit produced. Many prefer to grow the finest of fruit, being satisfied if they realize only what it costs them to raise it, rather than to get rich on an inferior grade. Hundreds of people went into the peach business. Hundreds went into it for the sake of money making, just as though they would start a saloon for profit, but peaches looked better. Millions upon millions of peach orchards planted east of the Mississippi have been abandoned within the past 15 years. Cotton planters of Georgia, bankers, merchants, lawyers, even preachers, went into it, supposing that by owning some land and planting a few peach trees they could live happily ever afterward. At one time there was in Georgia something over 18,000,000 peach trees. Today there are less than 8,000,000, yet those 8,000,000 are producing more high-grade marketable peaches than did the 18,000,000.

Serious drawbacks to prosperity and success in fruit culture in the East and everywhere are brown rot and curculio. The brown rot was the one destructive force. It either injured the fruit very seriously in the orchards or spread in transit. It was not controllable until extensive experiments were carried on in Georgia and it was discovered that the fungus could be controlled by the use of the self-boiled lime-sulphur. This discovery resulted in putting a good many orchardists on their feet who were just on the point of going out of the business. In addition to controlling the rot the spray gave the fruit a tougher and more resistant skin, making a more beautiful fruit and a better shipping one.

Blessings of Adversity

These adversities are the blessings of the peach industry. They strengthen the character and develop the fight in the grower. If it were not for these serious obstacles every man with a little money and less experience would be growing peaches. The energetic man would have no advantage whatever over the slothful. The blessings of adversity were never so strongly apparent as they are today in horticulture.

* * *

Notes on convention matters are crowded out and will appear next week.

Cherry Trees

Cherries are the first, the most attractive and the best fruit of the summer season. This, together with the fact that they are very profitable, yielding from $400 to $600 an acre, makes them a good "buy" for any fruit grower in position to raise them.

Our block includes Bing, Black Oregon, Black Tartarian, Burbank, Royal Ann, and other good varieties on Mahaleb and Mazzard Root. Write Us First.

For Sale—We have the most attractive irrigated land proposition in the West; soil fine for alfalfa; wheat and all crops; natural lake and abundance of water; easy terms. Investigate this now while you can get choicest tracts. It means good big dollars to you. E. J. Bonham, 2224 E. Fourth St., Los Angeles, Cal. Phone Boyle 598.

FOR SALE—MOUNTAIN AND FOOTHILL stock ranches. I make a specialty of this kind of property. If interested, write for my large list. Also some desirable exchanges. Address

G. W. Biswell,
718 Griffith-McKenzie Bldg.,
Fresno, Cal.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W Sill & Co., Watsonville, Cal.

Alfalfa and deciduous fruit land of my own. Several sized tracts. $35 to $475 per acre. Address Box 297, Corona, Cal.

HORTICULTURAL PRINTING

Catalogues for the seed and nursery trade. The live stock and poultry industries are a specialty with us. Two thousand illustrations to select from. Write for prices and samples. The Kruckeberg Press, 237 Franklin St., Los Angeles.

LIVE STOCK

Ohio Improved Chester White (O. I. C.) Entire herd immunized against hog cholera.
Nothing but immunized stock sent out. Extra fine lot of fall pigs, both sexes, ready for shipment during December and January. Three herd boars used. All stock crated and registered. Make reservations now. C. B. Cunningham, Mills, Sacramento Co., Cal.

Grape Wild Farm Thoroughbreds—Guernsey Bulls of A. R. Breeding. BERKSHIRE HOGS. Finest herd in the state All ages for sale. A. B. Humphrey, proprietor. Mayhews, Sacramento Co., California.

Prize-Winning Stock of Poland Chinas and Mulefoot Swine—Fine boars of service age for sale. Mulefoot pigs, both sexes. Dairyland Stock Farm, Chowchilla, Cal.

Duroc-Jersey Boars—Four months old; registered. Fine individuals. Silver-Spangled Hamburg roosters. Prices reasonable. Tribble Nurseries, Elk Grove, Cal.

Thoroughbred Berkshire Boars of all ages from developed and large-boned hogs Riccomi Bros., Mountain View, Cal.

Thoroughbred Doroc Jerseys for sale. Address Box 543, Lomita Rancho, San Jacinto, Cal.

Glenview Poland China—Stock for sale Chas. R. Hanna, R. F. D. No. 3, Riverside, Cal.

For Sale—Young registered Berkshire boars and sows, fine strong stock. Stanislaus Ranch Co., Crows Landing, Cal.

M. H. Locke Co., Lockeford, Cal.—Choice young Jersey bulls for sale.

MACHINERY

NEW AND USED RANCH MACHINERY
SAVE YOU HALF

Material guaranteed, disc, mouldboard plows, cultivators, harrows, seeders, potato diggers, balers, binders, headers, windmills, tanks, pumps, engines. Absolutely cheapest serviceable material can be produced for.

Holt Steam Tractor, 80 boiler, 60 engine; cost $4000; our price $850. Boiler engine absolutely first-class, just passed inspection. Part cash, balance payments. Auto, what? Demmitt Co., 120 N. Main St., Los Angeles, Cal.

Distillate and Oil Engines, pumping machinery of every description, spraying outfits, pulleys, belting, etc. We also have some used engines and pumps which have been put in first-class condition, which we can sell at a great reduction. The Money Saving Lawter Tractor has arrived, arrange for demonstration. Call and inspect or write for literature. Wm. Gregory, 602 North Main St., Los Angeles, Cal.

Gas engines, centrifugal and deep well pumps, motors, and everything pertaining to irrigation, for sale and exchange. If you want a complete plant or any part write us; we are experts in irrigation; advice and estimates cheerfully given. Will buy, sell or exchange. Reliable and responsible, everything guaranteed as represented. Machinery & Motor Exchange, Inc., 733-735 San Fernando St., Los Angeles. Main 6382. F-3433

For Sale—Two P. K. Wood Pump Heads, 6-inch and 8-inch respectively. Model 1910. These heads are new and in perfect condition; never used. A bargain at $40.00 each F. O. B. Los Angeles. Address F. D. Flint, Gates Hotel, Los Angeles, Cal.

For Sale—Used and new gas engine, 2 H.P. up, rebuilt and fitted with modern equipment. 22 years' experience enables us to repair and rebuild gas engines correctly. Get our prices. Lloyd, 806 N. Main, Los Angeles.

SEEDS AND PLANTS

$70 and $50 for Orders Placed Now with cash for present or future delivery. Luther Burbank $70 per 1000 slabs. Mediterranean $50 for 1000 slabs. Luther Burbank and Mediterranean Spineless Cactus Plantations, San Dimas, Cal., R. F. D. 35-A. Agents wanted.

Sour, Sweet and Grapefruit Seed, Bed Stock, extra fine plants from 10 in. to 2 ft. 4 in. high; heavy stock and the best plants on the market. Place your order now and get the choice. Gus Shelburne, 727 Brent Ave., So. Pasadena, Cal.

Seed Barley—We grow it on our own ranch, reclean it in our own mill, and sell it in our own store. Write for price and sample, stating quantity wanted. West Coast Seed House, 116-118 E. 7th St., Los Angeles, Cal.

Strawberry Plants—Gold Dollar, Early Ozark, Gold Mine, St. Louis Missionary. Fine plants, pure stock, prolific bearers. Large red berries, $2.50 per 1000. Himalaya Blackberry plants $3.00 per 100. W. E. Hixon, Arroyo Grande, Cal.

Strawberry Plants — Gold Dollar, Clark Seedlings, Magoons, Wm. Belt, Marshalls, Goodells, Early Ozark, and new Oregons, $2.50 per thousand. Thoroughbred plants. Mr. John Christiansen, R. F. D. 2, Canby, Oregon.

SPINELESS CACTUS

The very best Burbank spineless Cactus at reduced price. By mail, postpaid, 20c each. By the hundred, 15c. J. H. Young, Box 113, R. R. No. 1, Anaheim, Cal.

Berry Plants, Rhubarb, Cacti—It will be worth your while to send me a postal right now if you are interested. Louis F. Scribner, R. 2, Pasadena, Cal.

Strawberry Plants — Magoon, Marshall, New Oregon, Hood River or Clark's Seedling, Klondykes, etc., $2.50 per 1000. Fine plants, well packed. J. W. Vinacke, Canby, Oregon.

For Sale—Alfalfa seed free from bad seeds, fine quality, at 14c lb. Inquire of H. S. Garrison, Murietta, Cal.

Thornless Cactus Slabs for sale at 5 to 15 cents each. Chas. R. Hanna, R. D No. 3, Riverside, Cal.

MISCELLANEOUS

Free for Six Months—My special offer to introduce my magazine "INVESTING FOR PROFIT." It is worth $10 a copy to anyone who has been getting poorer while the rich, richer. When you find a man who is satisfied with what he had done, you will find that he is beginning to fail. It makes us smile when we hear a man tell about what he used to do. Give us the man who tells what he is doing and who has a vision.

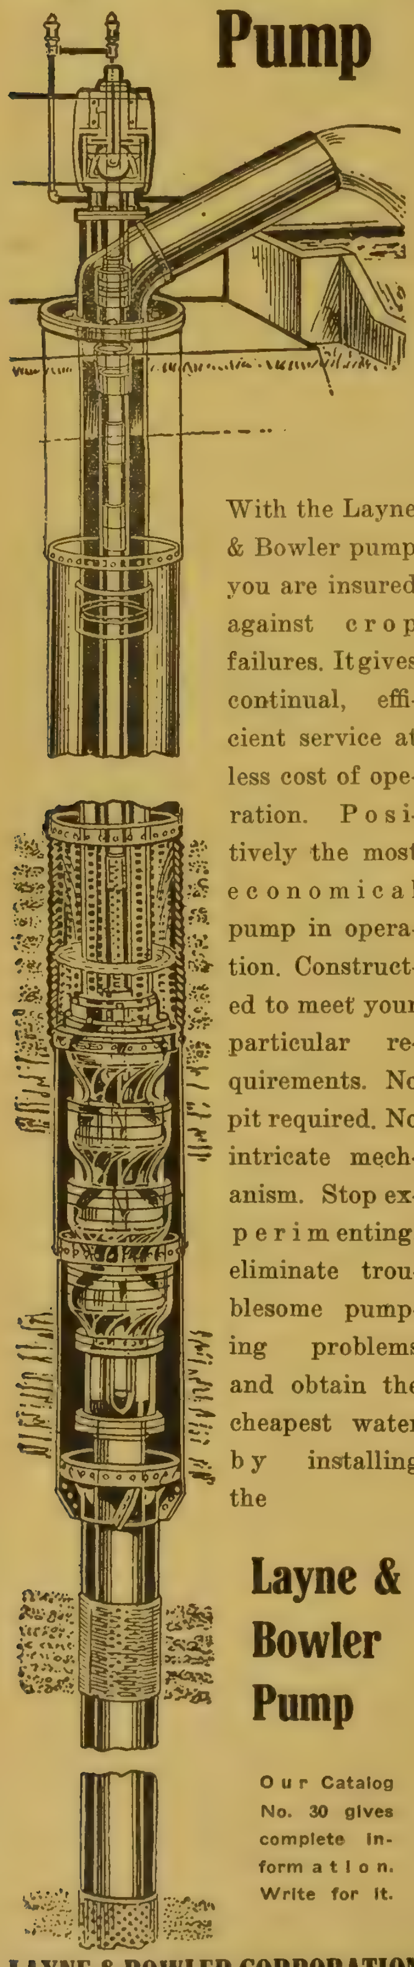
PRODUCER TO CONSUMER

Experience in the mail order business has proven that the producer does not receive what he should for his products, and the consumer pays too much for them. The Producers-to-Consumers Supply Company, at 206 Workman building, 230½ South Spring street, Los Angeles, announces a plan of direct selling from producer to consumer. With the plan of direct selling the jobbers' and retailers' profits are entirely eliminated, thereby increasing the producer's price and reducing the consumer's cost from 15 to 25 cents on the dollar; no credit or bookkeeping necessary; it's all cash before goods are shipped. At present they are in need of walnuts, almonds, oranges, lemons, grapefruit, dried fruits, beans, turkeys, chickens, strained honey and all farm products received by parcel post. The products must be first class, for only an honest deal between producer and consumer will insure a continuance and increase of business. The holidays are almost at hand, and great quantities of the above goods will be demanded. This firm has conducted a wide-spread advertising campaign all over the United States.

THE WISE RANCHER

WILL NOT WAIT UNTIL SPRING TO INSTALL HIS PUMPING SYSTEM. NOW IS THE LOGICAL TIME TO DECIDE. LET THE WORLD'S LARGEST WATER DEVELOPERS SOLVE YOUR PUMPING PROBLEMS.

Layne & Bowler Pump



With the Layne & Bowler pump you are insured against crop failures. It gives continual, efficient service at less cost of operation. Positively the most economical pump in operation. Constructed to meet your particular requirements. No pit required. No intricate mechanism. Stop experimenting, eliminate troublesome pumping problems and obtain the cheapest water by installing the

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

California-Florida Oranges

I am informed by a recent arrival from the east that California oranges do not find much favor in the eastern states, that the Florida oranges are so far superior in flavor, texture and juiciness. I would be interested to know whether the preference for the Florida fruit is universal in the eastern states or only among certain people or in certain localities where they have become accustomed to the Florida fruit. If it is a fact that the Florida orange is the most popular, is this due to faulty methods of curing or packing in California, and can these be remedied, or are climatic conditions here such that the fruit is inferior? The statement is also made that Florida grapefruit is far superior to the California variety.—Subscriber, Sespe.

Since the cotton centennial exposition held at New Orleans more than 25 years ago the California orange has stood chemical and other tests above any orange in the world. Tests made at that time showed the California navel orange to be richer in acids and far richer in sugar than any other. This is also proven to be true by market conditions in the east at the present moment. California Valencias are selling at practically double the price of the Florida early fruits, which are just beginning to come in. The matter of desirability of a fruit depends much upon taste. Where one wishes a sweetish juice without particular character, the Florida orange might appeal. But if a meaty, high flavored orange is desired, probably the California would be preferred. As to preference of the eastern trade, Californians can call attention to the fact that in the markets generally California oranges sell above those of any other section in the world. This is an indication that as a rule people prefer the richer fruit, containing a greater amount of sugar. With lemons the highest prices are practically always obtained for Californias. Of this fruit; however, Florida produces a very small amount. Compared with Mediterranean lemons Californias sell the higher. In grapefruit we must turn about and admit that Florida fruit commands the market, this for two reasons, first, the lack of bitterness and the large content of juice of the Florida fruit seems to please the taste of the average consumer. Personally, the writer prefers the tang of a good bitter grapefruit but recognizing the prevailing taste in this matter California growers are working toward producing a fruit which will have less of the bitter and meet more nearly the requirements of tre trade, and ultimately we believe we will accomplish this end. In the meantime, "Hats off to California grapefruit."

Curl Leaf of Lemon

What is the cause and remedy for curl leaf on lemon trees? Some of my best trees have become infected during the last two years, both bearing trees and nursery stock. Some of the fruit even shows a rough surface. I find no indication of scale or spider.—Subscriber, Los Angeles.

These leaves were submitted to Prof. H. S. Fawcett and he answers: "I have seen this curly leaf a good many times in different parts of the state, and I am inclined to think that there are two kinds. One kind is inherent in the bud and is one we would speak of as an 'off type' and often accompanies a rough, off type fruit. This could only be corrected by budding over the tree to a bud from a good normal tree. This condition of the leaf may sometimes be only temporary, due to some cause we do not understand, and the tree will later outgrow it. I would suggest that if the tree continues to show this condition under proper treatment, and the fruit is rough and of an off type, the tree be cut back and budded over.

Poisoning Rabbits

Is there any way of protecting beans from rabbits by placing out poison?—Subscriber, Merced.

The best protection against rabbits is rabbit-proof fence. It is very expensive, however, and at this season of the year when succulent feed, excepting in the neighborhood of alfalfa fields, is scarce, wisps of fresh alfalfa dipped in a strychnine solution is perhaps the best method of poisoning. A very small quantity of strychnine placed on watermelon rinds or similar succulent food is also excellent or, perhaps better, use lead arsenate, three pounds to 50 gallons of water.

Gophered Orange Trees

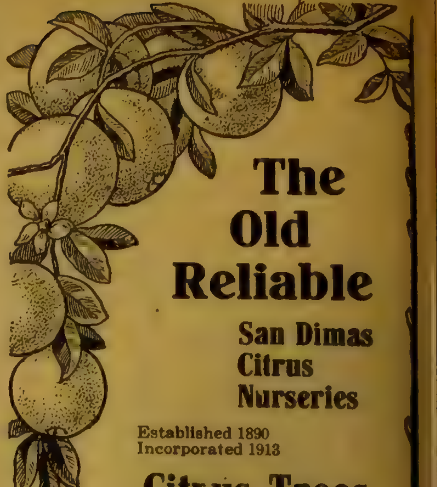
I find two bearing orange trees showing an unhealthy condition. Examination proves them to be undermined by gophers which come in from street ditch. I notice that the main root, small roots and bark and trunk are badly eaten off. Will such trees recover and how should they be treated?—Subscriber, Cucamonga.

If these trees are completely girdled, and so long ago that they are now showing indications of suffering by the appearance of the leaves, it is too late to make application of grafting wax or anything which will preserve the inner bark and permit it to grow over. That is, we suppose the wood has dried over and there is no possibility of forming the new bark. In such cases, if completely girdled, the only salvation for the tree is the bridge graft which is described in the issue of July 23, 1914. Do this at once. Pool the trees to run out gophers if any remain, putting water good and deep so as to thoroughly saturate all the ground, remove perhaps one-half of the top or at least reduce it. An application of stable manure will also aid in preserving the moisture in the soil and keeping it in good condition. Then go after the gophers, and for them the only preventive is eternal vigilance.

Morning Glory

I am planning to set out a walnut orchard in a field that is more or less infested with morning glory. I understand the only effective way of killing out this pest is by thorough weed-cutting during the entire growing season, but of course that is hardly practicable in a young orchard. Do you think the morning glory would be sufficiently detrimental to walnut trees to justify losing a year and the use of the land for the sake of fighting it, not to mention the labor and the expense?—Subscriber, Santa Barbara County.

We would plant the walnut trees



The Old Reliable

San Dimas Citrus Nurseries

Established 1890
Incorporated 1913

Citrus Trees Exclusively

All Leading Varieties

REMEMBER, MR. PLANTER

Practically anybody can grow a citrus tree, but it takes years of experience to produce a tree that will prove a money-maker when it comes into bearing. Nice-appearing nursery trees are desirable and promising, but do not always prove to be good bearing trees in the long run. Plant for profit and not for appearance only. Our trees are straight, thrifty, well rooted and have strong, full heads, but the main consideration is that: Our buds are carefully selected from heavy fruiting trees and will prove true-to-name revenue producers.

OUR TWENTY-FOUR YEARS

of experience in the growing and handling of citrus nursery trees gives the buyer the advantage of starting out RIGHT, thus avoiding disappointment at the end of four or five years' labor in bringing the young orchard into bearing.

ANOTHER POINT TO CONSIDER

Growing a good tree is only part of having it do well after planting. Many a good tree is ruined in the taking up from the nursery and shipping. We give the best of service in the proper handling and delivering of our trees.

WRITE,

'phone or call on us before buying your trees. Tell us your wants and we shall be glad to give you the benefit of our wide experience as to planting, soil conditions, fertilizers, etc.

Our illustrated new booklet on citrus culture mailed to any address upon receipt of 25 cents.

QUOTATIONS
GLADLY
GIVEN

San Dimas Citrus Nurseries

(INCORPORATED)

Established in 1890 by R. M. Teague

San Dimas
California
U. S. A.

Teague trees are started right, grown right, and shipped right.

this season and proceed to kill out the morning glory. The only practicable way to do this is perhaps by continuous weed-cutting, though we would call attention to the experience of a contributor to the Cultivator who found it possible to eradicate his pest by sowing the ground very thickly to rye. If the weed cutting plan is followed, then use care that no roots are dragged from infested spots to clean spots in the same field. However, from the inquiry it appears that the field is entirely infested.

Planting Daffodils and Gladiolus

When is the proper time to plant daffodils and gladiolus bulbs? In what kind of soil will they grow best? Can such bulbs be planted to best advantage in exposed or shaded places?—Subscriber, Hanford.

Daffodils should be planted at once —or a month sooner; gladiolus, any time after the first of January. With the gladiolus plant four or five inches deep, daffodils five to six inches, in good rich sandy loam. Cover with a mulch or rich stable manure and watch for a glory of blooms from the daffodils late in February or early in March. By planting gladiolus from the first of January to the first of June bloom may be had until September. Both of these bulbs will stand for a little shade. Perhaps in your section the gladiolus which are expected to bloom in the summer would do better in the shade. In either case the bulbs should be planted in ground from which the water may be withheld when they are done blooming.

Small Olives

What is the cause of my pickling olives being so small, and is there a treatment that will make them grow to larger size? We have irrigated and fertilized liberally, and the soil has been well cultivated about the trees, but this year the fruit is very small.—Subscriber, Sacramento.

From the statement that the fruit is small this year we assume it has been large on the same trees in preceding years. If such is the case it is a very hard question to answer in the face of the amount of fertilizer, irrigation and thorough cultivation given. Of course there are olive trees which never bear large fruits, and it is barely possible these trees have such an immense crop that they cannot bring all up to pickling size. In the short time remaining before harvesting it would be impossible to bring them up by any treatment we could suggest. We will ask olive growers who have had experience along this line to give us suggestions.

Breeds of Rabbits

Are Rufus Red and New Zealand Red rabbits one and the same breed or are they different breeds of rabmits? Also what is the color of the Flemish Giant?—Subscriber, Exeter.

Rufus Red is always applied to Belgian hares in speaking of their color. It is applied to those which approach standard requirements in color. The animals known as New Zealand hares are often called New Zealand Reds, owing to their color being red or a rich golden tan, but the former is the correct and more appropriate name for this variety, which is a different breed from the Belgian hare. Flemish Giant rabbits come black, steel, light greys and black coated over fur with white hairs here and there, called Silver Tips. A local state organization is trying to get whites recognized, but these are not genuine Flemish, but ordinary large white mongrel rabbits. The steel greys are the most valuable and sought after followed by the blacks. —R. V. M.

Slobbers

In recent Cultivator we noticed an inquiry regarding slobbers, the reply stating that there was no cure. If taken in the first stages of the disease we have cured several rabbits by the addition to the drinking water of one teaspoon of powdered alum to one quart of water. Continue this for two or three days.—Mrs. Jas. R. Beck, El Monte.

In addition to the above we may quote as follows from the Belgian Hare Guide: "Put a small pinch of salt in the mouth and rub it in the wet fur about the mouth. This has been found a sure cure, if in addition all food is removed from the rabbit for 12 hours. Mr. Wilkins recommends this treatment: Give twice daily a teaspoon of milk or water, into which put five to ten drops (according to the age of the rabbit and the severity of the attack) of a mixture of equal parts of oil of juniper and sweet spirits of nitre. As this sometimes fails cholerine is also recommended as a help to restore the digestive agents to their proper condition and act as a tonic in building up the strength of the animal. In addition to the treatment given above, remove the sick animals to another hutch and keep all food away from them for 12 hours; after that give them an entire change of diet."

Alfalfa in New Mexico

Would like some general information regarding alfalfa and pumping plants. What size of engine and what capacity of pump is required to irrigate 10 acres of alfalfa? The lift of water is some 60 feet. How many gallons per hour will one-quarter head, or 25 inches, running under a three-inch pressure in ditch make? In putting in alfalfa how is the land laid off, the seed sown and covered, and what time of year is best to start it? For locality I am thinking of the east central part of New Mexico.—Subscriber, Santa Ana.

The climate of New Mexico being very dry will necessitate the frequent application of water to secure good results from alfalfa and provision must be made to irrigate at least once in 20 days during the summer months, and possibly oftener on very porous land. About six inches in depth of water will be required at each irrigation, and in order to be sure of this amount pumping machinery should be installed which will pump the necessary water in 15 days, if a reservoir is used, and in a shorter time if ditches or pipes are used direct from pump.

Any good centrifugal pump with a capacity of 17 miners inches will pump enough in 15 days of 12 hours each to cover ten acres six inches deep. A six-horse power engine will be sufficient to lift this water 60 feet, but if there is a probability of the water level being lowered it will be better to put in larger power. It will not be economical to put in power and pump large enough to irrigate alfalfa without using a reservoir if only 10 acres of land is to be irrigated.

In common usage in California a continuous flow of nine gallons of water per minute is called a miners inch, but the statute miners inch is a flow of eleven and one-fifth gallons per minute, whether the head above the opening is greater or less. The common measurement of a miners inch is a one inch square opening under a four-inch pressure, but there are so many conditions to be considered that the measure is seldom correct. Twenty-five inches of water under common usage will be 13,500 gallons per hour and according to statute will be 16,875 gallons.—J. B. M.

MORE MILK

—a copy of this booklet will be sent to any address absolutely free and without obligation.

We want every dairyman and stock feeder on the Pacific Coast to have a copy of this booklet. It gives valuable information about feeds and feeding —and tells you how you can get more milk from your cows at no extra cost by feeding—

WRITE US TODAY for a copy FREE

LARROWE'S DRIED BEET PULP TRADE MARK REG U S PAT OFF

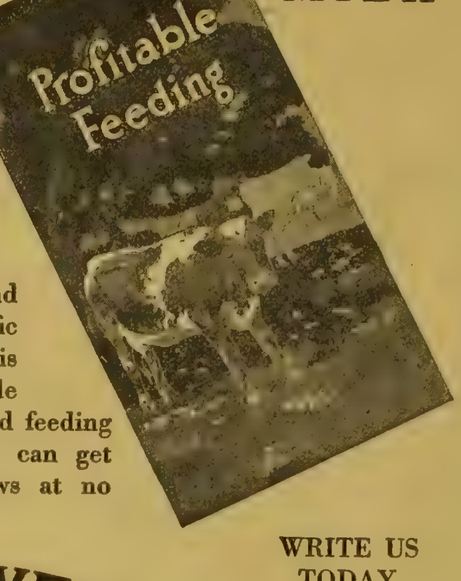
—the succulent milk-producing vegetable feed.

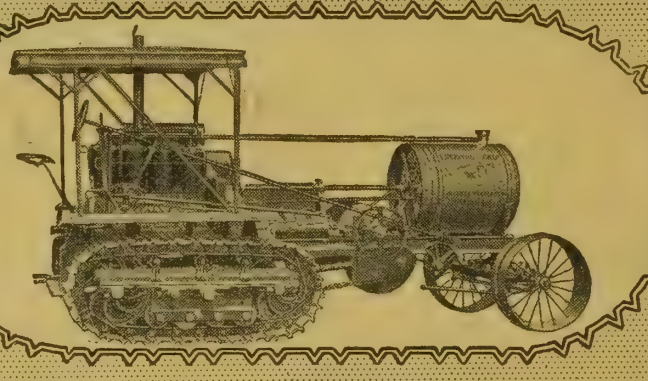
Larrowe's Dried Beet Pulp is the ideal feed, not only for dairy cows, but also for hogs, goats, sheep, poultry and horses. It is wonderfully rich in carbohydrates. Makes a splendid combination with alfalfa. Can be added to any ration with profit. Succulent, digestible and palatable —Larrowe's Dried Beet Pulp entirely displaces silage (or can be fed with it, if desired) and is clean and healthful. Can be had plain or with molasses.

When you start feeding Larrowe's Dried Beet Pulp you get an instant response from your cows not only in improved health and general condition—but an extra 1 to 5 lbs. of milk per cow a day. This is surely worth trying. Order a sack from your feed dealer today and test it on one cow whose milk record you know.

THE LARROWE MILLING COMPANY

607-608 Central Building, Los Angeles, Cal.





Get Your Crop in on Time with a "Creeping Grip" Tractor

WHY let low, wet spots in your field set you back? Your time is limited—your crop must be started without delay if you want maximum yield when harvest time comes.

Here's the tractor that asks no favors of soft, wet ground. It can pull your plows through any ground that's worth working. The creepers do not sink or pack the soil—they cannot slip and lose power. They creep along over the ground, getting a firm grip and giving you maximum traction with the least weight on the soil, least consumption of fuel, and least wear and tear on the power plant.

The machine rides on steel rails on the endless track. The creepers oscillate over rough spots. Thus the power plant is carried smoothly, free from jolts and vibration. The frame sets upon 3 points of suspension, which eliminates binding on the bearings.

No other power is as well suited for pulling your plows, harrows, seeders and combined harvesters. Let us tell you how you can cut your present cost of doing this work.

Write for Catalog

No other tractor is as carefully built as the "Creeping Grip." We put in it the best materials than can be produced. A demonstration will convince you. In writing please tell us how many acres you operate, so that we can suggest the best size suited for your work.

BULLOCK TRACTOR CO., 1814 Diversey Parkway, Chicago

The usual practice with land for alfalfa is to lay it off in lands of 20 to 50 feet in width with borders between to hold the water. The land should be brought to an even grade in the direction the water will run and level across the small lands, so there will be no high places which will not receive enough water nor low places which will waste water by having it deeper than is required. The width and length of the small lands should be regulated by the supply of water to be used as they should not be larger than can be covered in 30 to 40 minutes.

The seed bed should be well pulverized and the seed covered not deeper than one-half inch in medium heavy ground. About 20 pounds of seed is usually sown on an acre, but a large amount of this is lost as some will get so deep that it cannot come up and some will be so close to the surface that it dries out before the root can reach permanent moisture. The best success will be had by sowing in the cooler part of the year and at the time when there is the least danger of frost as the young plants are coming through the ground. If the weather should be very dry it will pay well to run a roller over the ground as soon as the seed is sown as this brings the moisture to the surface and secures a better germination and a better stand of alfalfa.—J. B. N.

Lice

What would cause half grown and grown chickens to hold their wings away from their bodies? In other words their wings hang as if they were unable to hold them up. These chickens are on green range and are fat. One hen got well. I am feeding Egyptian corn in the head with a mash.—Subscriber, Bakersfield.

I think your young chickens have a bad case of lice. Dust them thoroughly with a good louse powder. The Lowry powder is made as follows: Take three parts gasoline and one part crude carbolic acid, mix together and add enough plaster of paris to take up all the moisture. Add only a little at a time and keep stirring so that the liquid is evenly distributed. When you have finished it should be a dry pinkish-brown powder. Dust this thoroughly into the fluff and under the wings and repeat in a week to kill the nits that were left after the first dusting.—J. A. K.

Plowing under Vines

Is it wise to plow under tomato vines where the ground is to be used the following year for the same purpose?—Subscriber, Mountain View.

It would not be wise, for any bacterial or fungous diseases of these vines might be retained in the soil and prove injurious to the next crop. The vines could be raked off and distributed on orchard land or on land where a similar crop was not contemplated the following year and perhaps prove valuable as a humus former, but if no such place was open for disposal would advise burning rather than plowing under. Because of possible continuance of disease it is better to rotate, planting some other crop and transferring tomatoes to new land.

Egg Trouble

What is the cause of hens loosing their eyesight by the eyelids closing? —Subscriber, Bakersfield.

Are there no other symptoms, a discharge from the eye, perhaps, or inflammation of the eyeballs? Have you looked to see if there is anything in the eye? Sometimes hens running at large get "stickers" in the eyes, and these if allowed to remain cause an irritation which is sufficient to destroy the sight. Sometimes these cases come from roup. If there is any discharge I should treat them for roup. If there is none I should see if I could find any foreign substance in the eye. In either case bathe the eye twice a day with a boric solution (half a teaspoon of boric acid dissolved in a teacup of warm water). This is the best remedy for any inflammation of the eyes.—Subscriber, Bakersfield.

Planting Peaches and Prunes

Would it be advisable to plant peaches in this portion of Los Angeles County? Would they or would prunes do as well as in the Santa Clara Valley? Would the Satsuma plum be profitable? We have occasional fogs. Is the Hale peach good for this section?—Subscriber, Puente.

French prunes do better in the San Gabriel and Puente Valleys than peaches. The Satsuma plum is a good bearer in that district but the market is very limited.—J. W. Mills.

We think the Hale peach is an excellent peach and doubt not it will adapt itself to California conditions.

Chick Peas

I am sending a bean or pea which grew this year. What is its name and what is its worth?—Subscriber, Ventura.

Dr. Davidson answers that this is Cicer arietinum L., or chick pea. He is uncertain whether it is the one usually cultivated and sold to the trade or not.

Rice Culture

We have had several requests for information as to rice culture and will give such an article in this issue of the Cultivator from one who has observed it from all standpoints.

VETERINARY

(Continued from Page 498)

rectum or it may be due to something wrong with one of the ovaries. In the latter case it would be necessary for a veterinarian to operate and remove the ovary. If it is due to pin worms they can be gotten rid of by boiling two five-cent papers of scrap tobacco in three gallons of water for 20 minutes. Strain, cool to animal heat, and inject the whole of it into the rectum and make the horse retain it as long as you can by holding the tail down. This should be repeated in about a week.

Wire in Feed

Had some short pieces of wire two to four inches long which got upset in the manger where a young colt is fed. Am afraid the colt may have eaten some of the pieces of wire, although he seems well at present. What is best to do if he gets sick or would it be best to give something now?—Subscriber, Bachelor.

Probably the colt did not eat any of the wire. Horses very seldom swallow any hard substance with their feed. If by mistake they get a wire, nail or piece of rock in the mouth they will push it out with their tongue. Cattle are not so particular but frequently swallow pieces of wire, nails etc., with the feed, and when slaughtered for beef somtimes a handful of indigestible articles are found in the stomach.

Boils

Over a year ago a large swelling appeared on the body of my mare just back of the front legs. Two ulcers formed and discharged pus. Later ulcers formed on the breast muscles and after that others developed on the thighs, both inside and out, and on the neck near the ear. All were large and discharged a large amount of pus. The mare was turned out all last winter and fed grain. During the whole of the trouble she was very emaciated but later improved some. Now another large ulcer has developed on the hind leg between the ankle and hock. What is it and what can be done for it?—Subscriber, Lordsburg.

This is one form of blood poison and so far the mare has been able to resist the attacks of the germs. To rid the system of the poison the mare must be given tonics and fed liberally. For a tonic get powdered gentian six ounces, powdered nux vomica three ounces, bicarbonate of soda three ounces, sulphate of iron four ounces and ground fenugreek enough to make two pounds. Mix and give a tablespoon in the feed morning and evening. Also once a day put a handful of ground flax seed in the feed.

The Household Department

WHERE DO YOU LIVE?

I knew a man, his name was Horner,
Who used to live on Grumble Corner;
Grumble Corner in Cross-Patch Town,
And he never was seen without a frown.
He grumbled at this, he grumbled at that,
He growled at the dog, he growled at the cat,
He grumbled at morning, he grumbled at night,
And to grumble and growl was his chief delight.

He grumbled so much at his wife that she
Began to grumble as well as he;
And all the children, wherever they went,
Reflected their parents' discontent.
If the sky was dark and betokened rain,
Then Mr. Horner was sure to complain;
And if there was not a cloud about,
He'd grumble because of a threatened drought.

His meals were never to suit his taste;
He grumbled at having to eat in haste;
The bread was poor or the meat was tough,
Or else he hadn't had half enough.
No matter how hard his wife might try
To please her husband, with scornful eye
He'd look around, and then, with a scowl
At something or other begin to growl.

One day, as I loitered along the street,
My old acquaintance I chanced to meet,
But his face was without the look of care
And the ugly frown that he used to wear.
"I may be mistaken, perhaps," I said,
As, after saluting, I turned my head,
"But it is, and it isn't, Mr. Horner,
Who lived so long on Grumble Corner."

I met him next day, and I met him again;
In melting weather, in pouring rain,
When stocks were up and when stocks were down,
But a smile somehow had replaced the frown.
It puzzled me much; and so, one day,
I seized his hand in a friendly way,
And said: "Mr. Horner, I'd like to know
What can have happened to change you so?"

He laughed a laugh that was good to hear,
For it told of a conscience calm and clear,
And he said, with none of the old-time drawl:
"Why, I changed my residence, that is all."
"Changed your residence?" "Yes," said Horner,
"It wasn't healthy on Grumble Corner,
And so I moved: 'twas a change complete;
And you'll find me now on Thanksgiving Street."—Selected.

ONE THANKSGIVING

Thanksgiving was coming. Every day brought nearer the jolliest of days, but alas! for Benny there would be no Thanksgiving. He had nothing to be thankful for.

Benny was a city waif. His hair was yellow, his eyes blue, but in looking at him one saw mostly freckles. His clothes hung in rags about the thin little figure and his hands were ever in his pockets. One cold November day as he was sitting by a coal fire in a railroad station he noticed the following advertisement in a newspaper:

"Girl Wanted—Ten or twelve years. Apply Henry Flagg on Wellston Pike."

Benny wondered if a boy wouldn't do as well. Boys were lots better than girls and lots stronger. Just then an old and kind-faced clerk happened near and Benny said timidly:

"Say, can yer tell me where Wellston is?"

The clerk looked surprised, but answered:

"We-el I'm not sure but I think this road goes through the town. It's about 12 miles west."

With sinking heart he heard the "12 miles," but immediately he braced up. Was he not strong, and a boy? So he started sturdily down the track.

Benny reached Wellston about four o'clock in the evening. His shoes were almost off his feet, his toes were stiff and blue, his fingers numb with cold, and he was very hungry. He timidly asked where Henry Flagg lived and received the direction that it was two miles south. So he trudged wearily onward.

Benny had gone half a mile when the sound of horses' hoofs came to his ears. Looking around, he saw that it was an old white horse, hitched to a sleigh in which sat an old man, white bearded and with a kindly face.

"Well, son," the farmer called as he stopped, "you look well nigh froze. Come, jump in. I reckon you won't object to a lift."

So Benny was soon tucked in the fur robes with only the tip of his nose sticking out. He felt very cozy and warm.

"Well, and where do you happen to be going," the old man asked in a jovial tone.

"I'm a goin' to Henry Flagg's," Benny replied, "I saw in the paper where they wanted a girl. I can do lots of things and I'm twelve."

"Ye don't say," was the ejaculation. "Well, I happen to be the same Henry Flagg. First I knowed any one was expected."

Then Benny told all and just as he finished they drove up to a big comfortable-looking white house, out of whose chimneys the smoke poured in a delightful warm-looking way.

Mr. Flagg drew up with a loud, "Whoa, Nell." Then he just gathered Benny up in arms, robes and all, and started off with him.

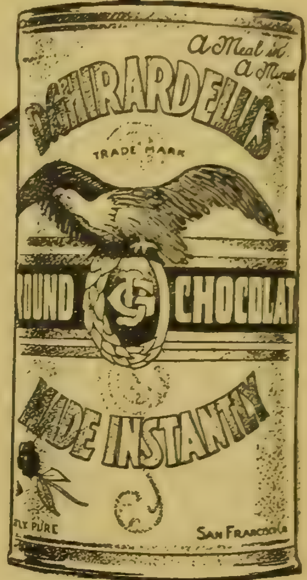
"Now," he said as he walked along, "you just call me Uncle Hank, then I think we'll get along better."

"All right," was the muffled answer. "My name's Benny."

Uncle Hank noisily entered the kitchen where a stout, rosy-cheeked, white-haired woman was stirring something that smelled delicious. She dropped her spoon as Uncle Hank set Benny down in a big chair and commenced taking off his shoes and stockings.

"Sary," he said, "I reckon you better hunt up a pair of my wool socks for this boy, cause his feet's cold. I'll run out and unhitch Nell."

With the exclamation, "land sakes," she hurried off, but soon returned with a pair of big blue, warm-looking stockings that she slipped on Benny's feet. Then she picked up the spoon and commenced stirring again. "And



Bring up a Girl—

Along lines that will develop her into a robust woman. Give her Ghirardelli's Ground Chocolate. No fear of harmful after effects. It combines all the elements which growing girls require, and it has a taste that every child likes. Every mother should serve it because of its purity, its wholesomeness and the ease with which it may be prepared. Costs less than a cent a cup.

In hermetically sealed tins.

Ghirardelli's Ground Chocolate is the only original ground chocolate. It has been used in Western homes for over a third of a century and its popularity is growing day by day.

now," she said as she stirred, "how in this world did you happen to come?"

Benny began at the beginning and told it all over again, while Sary was so interested that she forgot to stir the mince meat.

"Watch out there, that'll burn," he cried, as he caught the spoon from her and began stirring briskly. "Now Aunt Sary, don't you think you better get the pies ready?"

Aunt Sary did think so and so she bustled about, with Benny helping, until it was time to get supper. Then he peeled the potatoes, carried in the wood and kindling and set the table. After the supper was over he helped her do the dishes. Then Benny, Uncle Hank and Aunt Sary sat around the fire while they debated whether Benny should stay or not, At last is was decided that he should stay.

"I declare," exclaimed Aunt Sary, as she tucked him in, "I'm most glad you come."

"I know I am," said Benny as he snuggled down between the covers and grinned to himself in the darkness.—Ex.

Thank God every morning when you get up that you have something to do that day which must be done, whether you like it or not. Being forced to work, and forced to do your best, will breed in you temperance and self-control, diligence and strength of will, cheerfulness and content, and a hundred virtues which the idle will never know.—Charles Kingsley.

A DON'T WORRY CHRISTMAS

First Prize Article

Written for California Cultivator
By Lily Inglehart, Bellflower

The hard times, which visited many homes last winter, brought many a lesson for which the writer has since been grateful. Especially was this so in regard to Christmas giving. When it was first found that there would be practically no money for gifts, there was a feeling of despair. My Christmas list was long and although the gifts were always inexpensive, it had required a neat sum to fill the list. What would I do? One could not accept gifts, even from life-long friends and dear ones, without giving in return. At least this was my thought. I finally decided to write to each one, telling them the circumstances and suggesting that we exchange Christmas greetings without gifts. Imagine my surprise to find they were all pleased with the idea, as many were in like circumstances. One sister wrote back "Don't worry. We are going to have the most sensible Christmas ever and the most fun." And so it proved. The time usually spent in buying or making elaborate gifts was spent in more wholesome ways.

Sister planned an excursion into the hills for berries and greens to brighten the house. Formerly we had been too busy for anything of this kind, and how we did enjoy it! We also found we had plenty of time to write long, newsy letters to those at a distance into which we tucked either a Christmas card, a snap-shot photo, or a tiny sachet, or perhaps some pressed California flowers, gathered while on our vacation. Gifts were not entirely dispensed with, and we vied with each other, as to who could make the most out of almost nothing. Those who had a little money to spend wisely spent most of it for toys for the kiddies.

Simplifying the Christmas bill of fare is not so difficult. As far as possible choose dishes which may be prepared in advance. No one should be a slave to the cook stove on Christmas Day. Back numbers of the Rural Californian and Cultivator will furnish menus for both rich and poor, and with all the milkless and eggless, and butterless recipes recently seen no one need be accused of extravagance.

Your Christmas pudding will taste all the sweeter if some homeless person is invited to share it. You need not look outside your own circle of friends to find such. Girls who live in rooms and boarding houses, young men who either depend on the restaurant or "bach." These and many others will welcome a day spent in a real home.

In my father's home, the family Christmas tree is always grown in the back yard, by allowing one tree of the hedge to send out a beautiful top. This is decorated Christmas Eve and the children are allowed to see it Christmas morning. But the distribution of gifts does not take place till Christmas night, as some members of the family work late, and this gives them an opportunity to add to the pile of gifts under the tree during the day. The little folks, of course, get most of their toys in the morning, but there is always at least one mystery package on the tree for everyone, and there is always much fun and guessing over the packages during the day. One does not get much more than a peep at the gifts when they are distributed and the anticipation of a closer examination the next day does away with any "flat feeling."

Guests for the evening usually arrive during the afternoon, which is usually spent in playing games. Supper, consisting of chocolate, sandwiches, cake, fruit, etc., is served in the living-room, while all are seated round the Christmas tree. This saves lots of work and is quite enough after a good dinner at noon. Old Santa usually arrives in time to distribute the gifts and is received with a roar of laughter and fun. And while speaking of this jolly old saint, I would like to ask, "Does anyone think Christmas can be perfectly safe and sane as long as we deceive the children in regard to Santa Claus?" Several have recently said to me, "Yes you are right, but it does seem a pity to deprive the little folks of so much fun. My own experience has been that children lose nothing and gain much by knowing the truth. All children love "make-believe" games, and they can early be taught that old Santa is merely a personification of the real spirit of Christmas. The spirit of love, good-will and generosity which is abroad at Christmastide is responsible for the well-filled stockings and shining trees and is the real Santa Claus. But when the jolly old man appears in all his glorious make-up, the children enter into the fun just as much as in their make-belive games and for the time being they forget that he is merely playing a part.

The writer feels that no Christmas celebration is quite complete without the reading or telling of the Christmas story. Why all this joy and gladness? The children should have the thought of "Peace on earth, good will to men" so impressed upon their consciousness that they will always associate it with the Christmas season, and as a consequence their whole lives may be enriched with a love and consideration for others, even as was the life of the Babe of Bethlehem.

CHRISTMAS PLANS

Second Prize Article

Written for California Cultivator
By Mrs. Floy Crosby Smith, Fairoaks

As the problem of a "Safe and Sane" Christmas will soon confront us again, I will suggest some of the things that have robbed that season of it terrors, for me.

I write from the standpoint of a farmer's wife of limited means and still more limited time. No doubt there are many others in the same class.

I find that my intimate friends feel that it is wrong to lavish upon Christmas gifts the time and money that is really needed in the home, so our gifts to each other are simple and inexpensive.

A few of my friends limit their Christmas giving to cards with cheery greetings—and I cannot discover that any of us value their friendship any the less, and we should miss their tokens of good will as much as the more substantial gifts.

It is a great help, too, to keep Christmas in mind all the year round, for so many times when in town we see articles on special sale, and the thought comes, "That is just what Cousin May was wishing for," or "That picture or bit of fancy work is just the kind that my old friend likes best."

If the purchase is made at once the cost is not very noticeable, and the article can be wrapped at once and laid away, and one gift is off your mind.

In spite of all that has been said about prosaic gifts, I still believe in giving things that the recipient can actually use.

Did you ever know a city housekeeper who would not really appreciate some fresh reminder from the country, a roll of butter, a few eggs, or a jar of honey or peach preserves? And since Uncle Sam will carry by parcel post anything from a pumpkin to a box of holly and mistletoe, the actual cost of such gifts is small.

Perhaps your problem, like mine, is the ever present small boy. But boys of all sizes have always shown a fondness for eating. Is there not in your back yard a fig, almond or English walnut tree which yields more than you can use? What would please the youngster more than a pretty box filled with salted almonds or dried and pressed figs, or even shelled popcorn? You may be sure that the gift may be repeated for years without becoming monotonous to him.

If you have the time and ability, and prefer to make your gifts, it costs no more to make something useful, and though she may be too polite to tell you so, the busy housekeeper prefers it to some bit of flimsy finery for which she has no possible use.

The hardworking farmer's wife, with a family of little children, may admire the beauty of the gifts that reach her at Christmas time; a half-dozen boudoir caps, doilies and cushion covers which would never survive laundering, but they are soon relegated to some out-of-the-way place and forgotten. If her friends had expended the same amount of time and work upon embroidered pillow slips, towels, aprons, or even a garment or two for the baby, she would not only have admired them just as much but would have been reminded continually of the giver, by seeing them in use.

Often some member of the family is wishing for something which he can scarcely afford to buy. Why not, at Christmas time, instead of showering him with a number of small gifts, combine and purchase the easy chair or set of books he so much desires?

If you do not know of anything your friend wishes, try sending a dollar's worth of postage stamps and a humorous note. I'll venture he uses the first stamp to send a note of thanks, and he will mean every word he writes.

Whether your gift be great or small do not neglect to send with it a note or post card with a few friendly words, for "The gift without the giver is bare," and the little personal touch greatly enhances the value of your gift.

THE PRIZE CONTESTS

The first prize for article on the "Safe and Sane Christmas' goes to Mrs. Lly Inglehart of Bellflower. Her "Don't Worry Christmas" will be an inspiration and help to many of us.

The second prize is won by Mrs. Floy Crosby Smith of Fair Oaks for "Christmas Plans,' in which she gives many practical hints to the country home-maker on making Christmas a happy time.

Other excellent articles have been received and some will appear later in these columns. We certainly have some delightful and thoughtful writers among our household readers.

The Next Contest

This month we had no recipes and we know that all have missed them, so for the December contest we will come back again to good things to eat.

$.200 Cash

will be given for best menu for Christmas dinner, recipe for one dish and your plan for preparing the dinner so that as little work as possible is left for Christmas day itself.

$1.00 Cash

For second best.

Cultivator for Six Months

To all whose menus are published. When you send in your menu, send also name of one of your family who is now receiving the paper so his or her subscription may be extended rather than having a second copy go to your address for the six months.

Write Early

Address all letters to California Cultivator, Los Angeles, and mail them so they will reach this office by the morning of Thursday, December 10. The articles will appear in the issue of December 17 in time to give everybody opportunity to profit by the Christmas dinner suggestions.

Photo Contest

The next photo contest closes Tuesday morning, November 24, and prize winners will appear in the issue of December 1.

As before, $2.00 will be given for best and $1.00 for second best photo of country life on the Pacific coast and for all retained for future engraving, six months' subscription to the Cultivator.

THANKSGIVING DAY MENU

Written for the California Cultivator

By Isabel Cottle

Breakfast

Baked Apples Thick Cream
Corn Oysters
Grilled Club House Sausage
Oatmeal Wafers Coffee

Lunch or Supper

Scalloped Oysters Hot Biscuits
Baked Oranges
Little Pumpkin Pies
Citron Pound Cake Tea
Nuts Raisins

Dinner

Fruit Cup, Southern
Clear Soup Bread Sticks
Roast Turkey, Oyster Stuffing
Giblet Gravy
Peas in Potato Cases
Endive Salad, French Dresing,
Chiffonade
Celery Ripe Olives
Cranberry Frappe
Suet Pudding Black Coffee
Fruit

Fruit Cup, Southern

Make a good lemonade, not too sweet, add fruit juice in season, as strawberry, grape or raspberry. Chill, pour into high narrow tumblers, place a slice of pineapple on top, add a sprig of mint and a cherry. Serve with straws.

Suet Pudding

One cup chopped suet, one cup molasses, one cup raisins, one cup currants, three cups flour, one cup dry bread crumbs, two cups sour milk, one teaspoon soda, level teaspoon salt, one-half teaspoon each cloves and cinnamon. Steam two hours.

Sauce

To one cup sugar add one-half cup butter, one egg slightly beaten, three tablespoons hot water. Cook until slightly thickened. Flavor as desired.

Cranberry Frappe

Boil one quart of cranberries and two cups of water five minutes. Strain through cheesecloth; add two cups sugar and the juice of one lemon. Cool and freeze to a mush.

Peas in Potato Cases

Prepare three cups mashed potatoes, well seasoned and mixed with soft butter and a little cream or milk. Shape into little cases or nests and brush lightly with the yolk of an egg mixed with two tablespoons of cream. Brown in a moderate oven and fill centers with peas, which have been cooked, drained and seasoned.

French Dressing, Chiffonade

One-half teaspoon each of salt and paprika, a grating of onion pulp, six tablespoons of oil and three of vinegar. Beat thoroughly and add one hard boiled egg, one teaspoon of chives and one tablespoon each of red and green pepper and cooked beets, all chopped very fine.

Oyster Stuffing

Three cups of stale bread crumbs, one-half cup of melted butter, salt and pepper, few drops of onion juice, one pint of oysters. Mix the ingredients in the order given, add the oysters, cleaned and drained from their liquor.

THE WOMAN'S DEPARTMENT OF THE STATE FRUIT GROWERS' CONVENTION

The woman's department of the state fruit growers' convention held some intensely interesting sessions on Wednesday, Thursday and Friday afternoons of last week in the parlors of the Hotel Clark at Los Angeles. We regret that lack of space in this special contest issue forbids giving some account of the sessions. This will appear next week. However, the women will be as much interested as the men in the report of the main convention in leader and following pages in this issue, as was well shown by the large number of women who attended all sessions of the convention.

To have bread excite thankfulness and a drink of water send the heart to God is better than a sigh for the unattainable. To plow a straight furrow on Monday or dust a room well on Tuesday or kiss a bumped forehead on Wednesday is worth more than the most ecstatic thrill under Sunday eloquence. Spirituality is seeing God in common things and showing God in common tasks.—Maltbie D. Babcock.

"'Tis the songs ye sing
And the smiles ye wear,
That's a makin' the sun
Shine everywhere."

The "OLIVER" Gas Generator

Unsurpassed for Simplicity and Economy

A 50-light plant for Cooking, Heating or Lighting, for $1.00.
Uses ordinary motor gasoline. No heat, or adjustments, required.
An even gas, under varying conditions, always on tap.
No trouble to install.
The least expensive, yet best, gas generator ever introduced.
A product of California.

Cocoanut Oilcake Meal	23.00@24.00

Citrus Fruit Market

Los Angeles, November 18, 1914.

California orange shippers are showing good judgment this year and holding back immature fruit. The season is rather late this year, but the slower shipping is more to give to consumers a good taste for their fruit. The output will be great and from present indications will be of first quality. The Thanksgiving supply will be largely drawn from Valencias, which are still on track in various markets.

Central California shipments will be going forward more liberally next week.

Lemons are selling lower than for years at this date, this because of immense receipts of foreigns which sold as low as $1.40 in New York. As the cost to lay them on the wharf is about $1.50 it is apparent the importers are "making" money slowly.

Fancy California lemons are now commanding about $3.00 f.o.b. Shipments are made about as fast as fruit is cut from trees. The year's output will be the largest ever or from 6500 to 7000 cars.

Shipments

Shipments of oranges from Southern California to date since November 1, 234 cars; lemons, 158; total, 392. To same date last season: Oranges, 11; lemons, 31; total, 42. From Tulare County since November 1: Oranges, 57 cars; lemons, 28; total, 85. From Butte County: Oranges, 15. Total shipments from north of Tehachapi this same date about 150 cars.

NEW YORK, Nov. 16.—Eleven cars Valencias, one car lemons sold. Market strong and higher on Valencias, steady on lemons. Foggy.

VALENCIAS—	Avg.
Golden Cross, O. K. Ex	$4.30

Farm Produce, Eggs and Poultry

We are now located at address below and respectfully solicit consignments of all kinds of farm produce, including eggs and poultry. We guarantee to get the highest market price and remit promptly to shippers. A trial shipment solicited. We work on a commission basis, stating to shippers the amounts we receive for produce. We will give you a square deal. Send on your produce. FARMERS' UNION, Inc., of Arroyo Grande, Cal.

Oranges, boxes, $1.75@4.50. Persimmons, cases. 12 pints, 50@65c. Pineapples, cases, 24@36, $2.00@3.00.

There is also the auto fool who thinks he can get over the grade crossing eighteen inches ahead of a locomotive; and he frequently stays there, distributed in wild profusion up and down the right of way.

It is a mistaken idea that ivy vines keep walls damp. They keep them dry, as the little suckers, which cling to the walls, suck the moisture from the walls instead of attracting it to them.

Plant Pears for profit. California Bartlett ripen earlier than Eastern and Northwestern grown pears. During their season they monopolize the markets of the United States and Canada.

Silva-Bergtholdt's

FOOT-HILL GROWN PEAR TREES

are practically immune from blight and have strong, hardy root systems; the foundation of all successful trees.

We have a fine block of Bartlett, Comice, Winter Nelis, Anjou and other varieties. Our buds are cut from selected parent trees.

THE SILVA-BERGTHOLDT CO.
"Fruit Tree Specialists"
P. O. Box A Newcastle, Cal.

RICE GROWING

(Continued from Page 489)

and the heads do not "fill" as well here, the Japanese varieties are grown almost exclusively, and the principal one is called Wateribune.

Experiments are being carried on to find some good yielding earlier maturing sort. This will surely be done and when it is it will be of great value to the rice industry.

Climatic Conditions

The weather requirement for rice is a long hot growing season with as little daily variation of temperature as possible. The very hottest of Sacramento Valley summers are most favorable. As has been noted, the season of 1914 has been an unfavorable one because too cool.

Rotation of Crops

A keynote in the perpetuation of the rice industry for the future is the working out of some rotation of crops to alternate with rice. No single crop grown continuously on the same land has ever been successful for a long period of years, and the rice crop should be less successful under a system of constant cropping because of the long period in which the soil is practically waterlogged.

Corn, sorghum and grains are suggested as alternate crops. The water table generally stands too high for alfalfa.

We believe that a system which must eventually come will be rice growing on a diversified stock farm. A part of the farm will be in rice each year and the rest in crops to be fed to stock. Corn for silage will doubtless be one of the most profitable of these. These crops will then be fed to stock in paved or covered yards. This will make a well balanced and continuously profitable industry.

The big speculators who put in from 300 to 2000 acres of rice per year will often be disappointed in yields because of the difficulties in getting a sufficient acreage well prepared, the period at which the soil is just right to work often being very short. Several big fields this year will not pay to harvest. The careful small farmer with a modest acreage (10 to 40 acres) well cared for will get the big per acre yield, and in the aggregate these small farmers are sure to be a big factor in the future of the industry.

Yields, Prices, Profits, etc.

A great many different stories are told about yields and profits. Actually returns this year will run from $35 per acre loss to $50 and higher per acre net profit.

A general average estimate of the cost of growing a rice crop is $35 per acre. A good yield is 4000 pounds per acre and the price has been about two cents per pound for the past ten years.

Land on which rice is being grown could have been bought a few years ago for from $10 to $40 per acre. Now the range is from $40 to $150.

Where crops are grown on shares by tenants, the owner furnishes the water and gets one-third of the crop.

There is much enthusiasm and great interest in rice growing now in the interior valley of California. Fabulous tales are told of profits. Owners of land suited to the crop are besieged with prospective tenants. The industry has come to stay, and it will be permanent, not on the boom representations of those who now see in it a great get-rich-quick scheme, but on the basis of a big conservative food producing business.

MATHEWS ORCHARD DISC PLOWS

This is a simple and compact plow of few parts. Can be had either with one or two discs. Works close up to trees. Will penetrate the hardest soils and the heaviest cover crops without any tendency to get out of the furrow. The front furrow wheel is easily pivoted for turning to or from trees.

The strong simple construction of this plow embodies many attractive features which add to ease of operation.

The J. H. Hale—America's Greatest Freestone Shipping Peach

Firm as a Cling, Yet Perfect Freestone. Round, Holds Shape. Unexcelled for Canning. Rich, Meaty Flesh, Weighs 12% More Than Elberta, ⅓ to ½ Larger, Ideal for Drying. Late Bloomer.

The Peach for Western Growers

Here is a peach that will ship immense distances. A peach round in form and regular in shape, that doesn't "rag out", or discolor syrup, matchless for canning. A peach of sweetness, heaviness and density of flesh admirable for drying. Study these qualities:

Size, 1-3 to 1-2 larger than Elberta
Weighs 12% more per bushel
Tight skin, *practically fuzzless*
Golden yellow color, carmine blush
Solid and firm. Won't "squash down"
Longer keeper, better shipper
Globular shape for canning
Brilliant clear syrup
Better flavor than Lemon Cling
Heavy, dense flesh for drying
Large size, cheapest to handle
Ripens early—hangs late
Late bloomer, for frosty regions

A few peaches have *some* qualities best fitted for Pacific Coast conditions. But here is a peach that embraces them *all*. Find out more about the amazing J. H. Hale. Send for the catalog. Get posted—NOW.

What a California Expert Thinks

"The J. H. Hale is a very heavy, firm-fleshed peach—coarse fiber almost absent. Flesh solid yellow to the pit-wall, no excess of red at pit and no cavities around it. A variety that should prove of exceptional value in this state. If it persists in being as much larger than Elberta as is claimed it will be hard to hold in one hand in California."

Prof. E. J. Wickson, Dean College of Agr.
University of California

Be First In Your Section

As an orchardist looking for most profitable fruits, there is a golden opportunity for you in the J. H. Hale Peach. Read the complete story and description in our catalog. Our supply of J. H. Hale peach trees is limited. To get your trees you must *order early*. Ask about our special June-budded J. H. Hale peach trees for large planters.

Genuine Delicious Apple—Growers' Prices

You who have wanted genuine Delicious can now get them, extra size, extra grade, with the famous William P. Stark quality, direct from our nursery and at nursery prices. Write for catalog showing complete list of tested, profitable apples.

No Agents—Save 30% to 50%

By ordering from catalog you do business with us direct. No salesmen's or agents' commissions and expenses to add to your tree-cost. Note the saving—it figures from ⅓ to ½. All prices printed in plain figures. *One price* to all.

Illustrated Catalog—FREE

You need this compact, handy tree-book. Fits in your coat-pocket. Handsomely illustrated. Contains complete J. H. Hale story. Lists all good varieties apple, peach, pear, plum, cherry, apricot, quince, grape, bush-fruits, roses, ornamentals, etc. Send for it today.

Read What Our California Customers Say. Our Trees Pass All Inspection Laws. Safe Delivery Guaranteed.

Concord, Cal., Dec. 18, 1913.
Gentlemen:
Trees received and very much pleased with quality of both roots and tops. They were carefully examined by Government Inspector, and got a clean bill of health, also praise for the healthy, clean stock you send out.
WM. JUDGE

Corona, Cal., Jan. 31, 1914.
Gentlemen:
Shipment of 480 XX J. H. HALE peach trees arrived in excellent condition. Passed rigid Horticultural inspection. All very much pleased.
H. G. SALISBURY

Stevison, Cal., Feb. 10, 1914.
Gentlemen: I received the trees in good shape, in fact, in better shape than I can get stock right here. I was ready to plant the day they arrived, and I am certain they will grow, as ground is in best of shape.
S. N. NELSON

Willits, Cal.
Gentlemen:
Our inspector did not open the trees, as he said he was sure all trees coming from the William P. Stark Nurseries were all O. K. He is from Missouri and has been through the William P. Stark Nurseries.

CALIFORNIA CULTIVATOR

Rural Californian combined with California Cultivator

An Illustrated Weekly Magazine, Devoted to the Rural Home and Ranch

LOS ANGELES November 26, 1914 SAN FRANCISCO

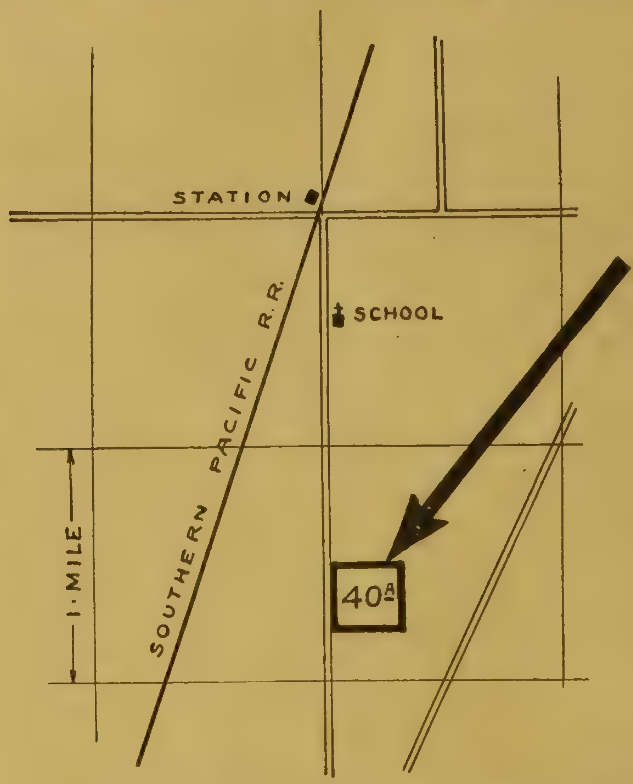
In the Butte County Rice Belt

Butte County and Other Sacramento Valley Sections Are Now Growing Thousands of Acres of Rice, Which When Properly Cultivated Has Proven Profitable. It is a Crop Requiring Careful Handling.

Courtesy Sacramento Valley Monthly

I Will Stake My Reputation on the Success of These

40 Acre Equipped Farms



Dudley Moulton.

Formerly Agricultural expert, United States Department of Agriculture and deputy State Commissioner of Horticulture of California.

They are completely equipped farms—Fertile fields that now require only ability and energy to change them into homes and make them bloom into rich harvests.

LOCATION. This choice land is in the Sacramento Valley, not far from the foothills. It is the alluvial land of the high Sierras that Nature has washed down through centuries of time and purified and fertilized with the warm air and sunshine of a true Thermal Belt.

It is virgin soil—rich, mellow and extra deep

The land, with water, is ready to respond to your labor, to bring forth an abundance for present consumption and to develop strong trees for greatest future bearing and permanent value.

I ADD TO THIS LAND, FOR EVERY PURCHASER, THE SEED AND TREES BEST SUITED TO IT. A SELECTION OF ALMOND, APRICOT, PRUNE, PEACH AND FIG. FOR PLANTING ALONG THE ROADWAY, OLIVE, LEMON, ORANGE AND WALNUT TREES.

MY SPECIAL KNOWLEDGE OF TREES AND THEIR ADAPTABILITY GIVES YOU ASSURANCE THAT THE TREES WILL BE THE BEST POSSIBLE TO SECURE AND THAT THEY WILL BE SUITED TO THE SECTION SELECTED.

I also furnish a complete selection of seeds, including corn, beans, milo, alfalfa, rice and grain. YOU CAN ARRANGE THE ACREAGE FOR EACH ONE AS BEST SUITS YOUR INCLINATIONS. I WILL SUBSTITUTE POULTRY IF YOU DESIRE IT.

In Addition to This I Furnish a Plow, Harrow and Cultivator

And further, I bore you a well and install the pumping plant complete. TURN ON THE SWITCH AND THE WATER WILL FLOW. There is ample water in this section for all purposes and it can be drawn from one well.

THE PRICE. All of this at $150.00 per acre. One quarter down and the balance to suit.

THERE IS A GOOD MARKET OUTLET FOR YOUR PRODUCE. The great bay region of California, comprising San Francisco, Oakland, Berkeley and Alameda, is within ONE HUNDRED AND FORTY MILES OF THIS LAND. It is on the Southern Pacific and Western Pacific Railroads and there is a station on the tract. ALL TRANSPORTATION PROBLEMS HAVE BEEN SUCCESSFULLY MET.

This should be one of the best developed farming sections in the entire state within a few years and make a profitable investment and a comfortable home for every buyer.

LAND VALUES WILL INCREASE WONDERFULLY AND PURCHASERS WILL SECURE A CONSIDERABLE ADVANCE OVER PRESENT PRICES. THE LINDSAY AND PORTERVILLE DISTRICT WAS SIMILAR TO THIS TEN YEARS AGO.

I want to talk with every one who is interested in securing a specially located piece of land. I want them to see this property and to know the prospects of increasing values that await those who purchase now.

YOUR EASTERN FRIENDS WOULD BE INTERESTED IN THIS LAND. Give me their names and I will send them, absolutely free, a three months' subscription to the California Cultivator. They will learn much that will interest them from its pages.

Write me for further particulars relative to this opportunity to establish yourself on a profitable and fully equipped farm.

Drainage and Alkali Reclamation

An Address by Frank Adams Before a Former State Fruit Growers Convention

During the past 15 or 20 years the owners of western irrigated lands and the communities dependent on them for prosperity have quite generally come to realize that drainage is almost as fundamental, even if not fully so, as irrigation. Many hundreds of thousands of acres of once highly productive lands have acre by acre been rendered wholly or partially non-productive through an excess of ground water in the feeding zones of plants and the consequent concentration at or near the surface of excessive quantities of alkali.

While this condition obtains in every western state, it is usually localized in those sections of each state where considerable quantities of water have been or are now being used, where the irrigated lands are relatively flat and distant from ample natural drainage channels, or where lands are so situated with reference to canals as to receive lateral seepage from them, as, for instance, when they lie at the base of relatively steep slopes across which canals are run.

If the excess of water that causes injury to a farm were merely that which the farmer himself applies in irrigation to his own farm over and above the immediate needs of his crops, little general injury would be likely to occur, because few farmers would continue long to add water to land already excessively moist. But it is usually the water that seeps from canals or from higher irrigated lands, and the coming of which the individual cannot prevent, that does the damage.

Drainage Methods.

It would not be worth while to give a detailed description of the various methods that have been developed in this country for draining irrigated lands, even if the writer were a specialist on that subject. Those interested can obtain far more information than I can give by reading the various drainage publications issued by the irrigation and drainage investigations of the United States department of agriculture, all of which can be obtained free on application to the secretary of agriculture at Washington. A few general observations as to methods may, however, be in place here, especially as they may aid in making clear the results of specific drainage experiments conducted by the irrigation and drainage investigations and the state engineering department of California near Fresno to be taken up later in this paper.

Since the condition that makes drainage necessary is not due to the water applied directly in irrigation, but rather to the water that seeps from canals or higher over-irrigated ground, the fundamental process in drainage is to intercept the excess water in its lateral percolation along some hard or relatively impervious sub-stratum or in its rise in the form of ground water. Consequently the location and depth of drains is of prime importance. If it is feasible to intercept lateral seepage water before it reaches a point of injury, it is obvious that before locating drains the sub-surface conditions must be looked into with great care. This simple fact is mentioned here because, according to those who have been conducting drainage investigations it is very frequently overlooked. On the other hand, if the injury comes directly from below, by the rise of ground water, it is plain that drains must be large enough and deep enough and, if of tile, so carefully laid as to both alignment and grade, that they will not clog, but will hold the ground water low enough to give ample feeding room for plant roots and generally to prevent the rise of water by capillarity and the consequent accumulation of alkali on the surface. In damaged irrigated fields experience has shown that six feet is about a minimum depth for tile drains.

Where the adverse condition of excessive moisture has obtained sufficiently long to result in an excess of alkali, it is evident that in addition to drainage, assuming the natural precipitation is not sufficiently heavy to accomplish reclamation within a reasonable time, surface flooding is necessary to wash out the excessive salts. Sometimes both drains to intercept lateral percolation and drains to lower the ground water coming up from below are necessary in the same field. Again, where it is not practicable to place drains deep enough to collect water pressing up from below, drainage engineers consider it feasible to excavate pits four feet or more deep at intervals directly beneath the drains which when filled with gravel readily carry the water up to the level of the drains. Occasionally when water seeps laterally through gravel before reaching and causing injury to a field, collecting or "relief" wells in the gravel are sunk and connected to the drainage system. Where drainage waters cannot readily be discharged by gravity it has been found feasible to collect them into sumps from which they can be pumped into irrigation canals or other surface channels lying above the level at which it is desired to maintain the ground water.

Drainage Experiments In Other States.

Since about 1901 the irrigation and drainage investigations of the department of agriculture have been conducting drainage experiments in the western states, until recently mostly under the immediate direction of Mr. C. G. Elliott, who for some years was chief of drainage investigations. Experiments conducted near Fresno under the direction of Dr. Samuel Fortier, chief of irrigation investigations, will form a later subject in this paper, but before taking them up it may be of interest to cite some of the results obtained elsewhere. Only brief mention will be made of such results as are cited because the experiments are described in detail in Farmers' Bulletin No. 371 and in a reprint from the annual report of the office of experiment stations for 1910, entitled "Development of Methods of Draining Irrigated Lands."

Eleven separate drainage experiments were carried on in Utah from 1904 to 1908, with some of them still in progress. A few of these only will be mentioned.

Hyde Park Experiment.

This covered two separate holdings totaling about 31.5 acres in an affected belt of 2000 acres, between Hyde Park and Logan, on which satisfactory yields had been obtained for 20 years prior to damage by seepage. The soil was black loam underlaid with yellow clay, both of an open nature. First cereals and root crops gave way on account of seepage to hay grasses, the latter in turn being replaced by water grasses. Lines of 8-inch and 6-inch tile were laid 4 to 4.7 feet deep along the upper edge of the experimental tract to intercept the seepage from the higher lands adjoining, and a line of 5-inch tile was placed four feet deep lower down to care for the seepage that passed the upper line. Since drainage yields of 50 bushels of wheat, 100 bushels of oats and 18 tons of sugar beets per acre have been taken from the reclaimed land. The average cost per acre for drainage was $15.60.

Garland Experiment.

The area treated here was 60 acres, the soil being clay loam underlain by separate strata of sand and clay and pockets of sand, and the tract itself being part of a flat depression separated from Bear River canal by a stretch of sandy lands. The source of excess water was seepage from irrigation and the canal. Trouble began with a season of sub-irrigation when the crops were record-breakers. Then several acres became drowned out. Eleven farmers joined the department of agriculture in the drainage experiment. Both intercepting and outlet drains were used. Five-inch and 6-inch tile placed four feet deep led to 8-inch and 10-inch main outlets. The resulting improvement in this tract after drainage was very marked, not a trace of alkali showing. The average cost per acre was $16.87. Since this experiment was concluded a drain-tile factory has been built by neighboring farmers, because the tile the experiment proved were necessary could not be obtained within a convenient shipping distance. In addition hand labor has been displaced in some cases by steam trenching machines suitable to the soil present and which excavate the trench to the full required depth at one passage.

Richfield Experiment.

This covered 80 acres in central Utah, the tract having a gentle slope of about one foot in 200. The source of seepage water was lateral percolation through a sand sub-stratum from higher lands. Two parallel lines of 5-inch and 6-inch tile were laid 600 feet apart across the slope, with a few laterals of 4-inch tile to tap particular spots. The average depth was 5 feet. An open-trench outlet, first proposed to reduce cost, was replaced by a 10-inch pipe drain. Only the very highest portion of the 80-acre field was producing crops when the experiment was undertaken, the balance being covered with salt grass. After the work was completed a great deal of water was discharged, apparently from every part of the system, damp spots becoming dry, and the spread of alkali stopped. The writer has not at hand the results of this experiment to date, but conditions were reported so gratifying that other projects were undertaken in the same locality, including the formation of a drainage district of 1000 acres. One of the farmers in the tract subjected his land to a thorough leaching process and was confident of general success. The acre-cost in this experiment was $14.02.

Experiments Near Fresno.

It is not necessary to multiply instances from other states of successful experiments in draining irrigated land injuriously affected by the rise of ground water and alkali accumulations. This is especially the case since, as already mentioned, experiments have been conducted in the near vicinity of Fresno. The first work done here was on the Taft and Hansen farms at Fig and Central avenues, three miles south of the city, and was under the bureau of soils of the department of agriculture. The plan was to drain into a sump and then lift the drainage water into Central canal by means of a three-inch centrifugal pump operated by a water wheel in the canal. The first tile installation was partially unsatisfactory, but it was replaced by a larger one. The pump was operated for several years whenever there was water in Central canal to turn the water wheel. This was not sufficiently steady, however, to hold the ground water at a sufficiently low level, because during the season of high ground water here a few hours only are required after stopping a drainage pump to have the ground water reach its former level. In 1908, owing to the unsatisfactory power supplied by the current wheel in the canal, a portion of this tract was connected with

Clover
Vetches

produce humus and nitrogen in the soil — the two big essentials in groves and orchards. From our studies of the needs of the citrus belt this year, we are strongly recommending the following:
FENUGREEK: is a rank and rapid grower, producing successfully on poor soils.
MELILOTUS INDICA and BURR CLOVER are also adapted to heavy and poor soils as they produce a deep and heavy root system resulting in the breaking up and in the porosity of the soil.
VETCHES: We are headquarters for imported and Oregon vetch.
We cannot too strongly advocate the inoculation of seed for best results. Hundreds of our patrons testify that the use of

FARMOGERM

300%
Crops

has increased their crops from 200 to 300%, thus giving more humus for the soil and more nitrogen -- gathered from the air by the nitrogen gathering bacteria and deposited in the soil through the nodules they form. The cost—less than $2.00 per acre. For booklet on *Farmogerm*, advice on Cover Crops and Prices, write to Dept. C

Citrus and Tropical Fruits

IMPROVEMENT OF CITRUS FRUITS BY BUD SELECTION

By A. D. Shamel, before State Fruit Growers at Davis.

THE problems arising from the behavior of bud propagated plants is receiving more attention now than ever before in the history of horticulture. The writer believes that we are entering upon an era in which as important discoveries will be made in this respect as those of Darwin, Mendel, De Vries and others in the reproduction and propagation of seed bearing plants.

The writer wishes to make clear that in this paper he does not recommend any particular method, draw any final conclusions, or state final results or fundamental principles, but will attempt only the presentation of observations and methods as suggestions for the considerations of interested citrus growers. About 90 per cent of the time of our staff is spent in the citrus orchards making observations at first hand of the behavior of trees and fruits. In the writer's opinion this method is the only one by which any valuable information can be secured.

Varieties

The Washington navel orange was the variety first selected for study by the writer in 1909. It is the most important citrus variety in California or elsewhere. It was first introduced in California in 1875 and the facts concerning its origin, introduction and development are known. From its peculiar navel character and seedlessness, being propagated only by budding, different types in this variety cannot be ascribed to any failure of buds to grow during propagation. Very frequently the writer has had deciduous fruit growers ascribe a new or different type of tree in an orchard to the failure of the inserted bud to grow, hence the new type is said to be simply the original seedling in which the bud was inserted. This has been the almost universal explanation of the appearance of a new type in established orchards. This theory or explanation is open to serious objection and criticism and in several specific cases investigation in deciduous and citrus fruits has been disproved. The types of Washington navel orange cannot by any stretch of immagination be accounted for by this stock and handy theory. For these and other reasons this variety is particularly well adapted for study in this connection.

While prosecuting our investigations and studies of navel orange trees our attention was called to the condition of the Marsh's seedless grape fruit variety, the leading commercial variety of this fruit in California. In view of the rapidily awakening interest in this variety and fruit in the state, and its diversity of type, a careful study of this variety was begun in 1910.

Naturally the condition of other important citrus varieties and the comparative behavior of existing types of these varieties came to our attention as our knowledge of the Washington navel orange increased as a result of continued observation. The Valencia orange, Eureka and Lisbon lemon and the Dancy tangerine varieties were added to the list of varieties under systematic observation in the order named. Some cooperative observations are being collected in the behavior of the so-called sweet seedling variety which was introduced into California by the Franciscan missionaries about 1769, some of the original trees still existing in the vicinity of the old missions. Other less important commercial but interesting citrus varieties will be studied as soon as opportunity permits, particularly the so-called blood orange, Villafranca lemon, and certain tangerine varieties.

The established commercially important varieties of the citrus grown in California have been adopted by growers as a result of practical experience and experimental trials. The quality of the fruit produced by these varieties has been found so satisfactory that it is not probable that they will be supplanted in the near future. It is possible, however, that supplemental varieties adapted to particular soil and climatic conditions will be found to be of great value, and will be introduced after careful experimental trials.

Stocks

Most of the varieties which we are studying have been propagated on the mission sweet seedling orange stocks. In some instances, however, the lemon varieties have been budded on the bigarade or Florida sour orange stocks. The seeds of the bigarade orange have usually been imported from the Florida hammocks, and stocks raised from these seeds are said to be resistant to gum disease under some conditions of soil and climate in California. Another stock which has been used to a considerable extent commercially in California recently is grape fruit. The varieties of grape fruit used for this purpose are usually the more heavily seeded sorts. Observations are being made of the behavior of our commercial varieties budded on this stock.

Another problem in this connection is the behavior of commercial varieties on stocks where the original sort has been rebudded to another citrus variety. It has frequently occurred, for instance, that a nursery budded to lemons has been rebudded to oranges one or two years after the original budding. Usually the rebudding has been done a few inchces above the original lemon buds, so that in the trunks of the established trees a small section of lemon wood remains between the stock and the orange wood. The section of lemon or orange wood has been called a "sandwich." The behavior of some orange trees having this condition, as shown by our performance records and other observations, suggests that this "sandwich" may play an important part in the life history of the trees. The most extensively used stock in orchards under observation is the mission sweet seedling, which was adopted as a result of the experience by growers with this and other stocks.

Location

The selection of locations for direct experimental observations or for co-operative work has been based on the proven adaptability of these locations for the production of the typical and most valuable crops of the varieties under observation. In the selection of experimental observation plots for detailed performance records, the greatest possible care has been used to provide fair comparative conditions, and where any possible influence of local environmental or cultural conditions has been reduced to the minimum. In most cases the general or orchard source of buds from which the trees have been grown is known and they are in existence for additional study. Naturally it is impossible for us to know all the facts about the propagation of all the orchards, as such knowledge can only be gained by careful performance and pedigree records, which have not been introduced or used until recently. However, sufficient facts about the propagation and culture of these orchards exist to prove their adaptability for this work and the reliability of evidence secured from them.

It is our desire to increase the number of locations for this work, including every important citrus district in the state if means for carrying on this work can be obtained. To do this practically it will need one specialist for each district. One man in a district can secure systematic and detailed performance records from several plots and from several varieties. In view of the close and regular daily observations needed during the picking season, in each plot, and the importance of frequent observations at other seasons, one person cannot well attempt to carry on work in several different districts.

It will be very desirable to carry on careful performance records in different districts because of the well known influence of soil, climatic and environmental conditions on the behavior of citrus varieties as a whole. The extension of our studies in this connection will likely depend on the interest of the growers in the subject in different localities.

Types

We use the term citrus types to describe groups of trees of a given variety in our established orchards possessing similar important characteristic habits of growth, production, or other fundamental commercial or other characters. The differences between the types is less than the difference between varieties. In other words, we have considered types as offshoots from the variety, retaining certain fundamental varietal characteristics, but differing from the standards of the varieties and from each other in important commercial characteristics. For instance, the fruits of the several types of the Washington navel orange all possess navels, but differ in color, shape, size texture, quality, time of ripening and other commercial characters.

Our discovery of the frequency of the occurrence of diverse types in our established orchards, and their relation to commercial citrus culture is the basis upon which our work in this connection has been founded. As the types which we have discovered do not all occur in any given variety in any one orchard, it is safe to assume that many types exist which we have not found as yet. The discovery of the types under observation has been a gradual matter, as our knowledge of varieties has grown, so that it is equally safe to assume that types exist in the orchards under observation which we have not recognized as yet.

We use the term type to include only the variations from the variety which occur frequently and are commercially important, and not the almost innumerable occasional variations which we find in citrus orchards. These more or less infrequent cases are collectively called sports or variations for want of a better name.

We have under observation at present eleven types of the Washington navel orange, five types of the Marsh's seedless grape fruit, seven types of the Eureka lemon, five types of the Lisbon lemon, eleven types of the Valencia orange and three types of the Dancy tangerine; a total of forty-two citrus types in all. Some types are, relatively speaking, of much greater commercial importance than others, and some types occur much more frequently than others, but all included in the above list are of practical and commercial importance. It is also true that the frequency of appearance of these types varies in different orchards, some orchards containing many while other orchards contain only a few.

Type Characteristics

One of the characteristics that differentiate citrus types is the habit of tree growth. For instance, the so-called Australian type of the Washington navel orange has the well known upright habit of growth as well as a more rapid rate of growth than other types of this variety. The so-called shade tree type of the Eureka lemon has a peculiar spreading habit of growth that identifies it clearly, and as in the case of the Australian navel type, it stands out so markedly that the trees of this type can be seen from a distance. The seeded type of Marsh's seedless grape fruit trees have a drooping habit of growth that once recognized is unmistakable. The barren type of the Valencia orange trees have a peculiar fine branching arrangement and dense habit of growth that is very characteristic, as is the case with the barren type of navel orange.

The shape of fruit is an interesting distinguishing type character, as for instance the yellow navel, the reddish color of the Thomson navel, the striped appearance of the variegated lemon, the yellowish green color of the rough type of the Valencia orange and many other instances of similar characteristic type color of the ripe fruits.

The shape of fruti is an interesting type marking, as in the case of the egg shape of the standard Washington navel fruits in comparison with the pear shape of the golden nugget type, globular shape of the yellow

Olive Trees

Olives worked on Picholine Root have stronger growing and deeper feeding root systems than those grown from cuttings.

Our Olives are worked on Picholine Seedlings, the wood being cut from trees having a record for productiveness and size of fruit.

Protect
Your farm, family & stock from drought with a
Deep Well

The man with a deep well doesn't have to worry about the weather. He knows that whether it rains or not he will have plenty of good pure water for irrigation—for live stock—and for domestic use.

Shallow wells don't pay. Drill a deep well and be drought-proof.

A Pomona Deep Well Pump is the only pump to use if you desire a sure constant water supply at the least cost.

The Pomona Pump is used in connection with dug, bored or drilled wells from 8-inch inside diameter up, and for capacities of 50 to 1000 gallons per minute, built for pumping from a depth of 75 feet to and including 500 feet.

It lifts water from great depths very economically — works without jerk, jar or vibration — and seldom requires repairs. A man wrote us recently that he had run his Pomona Pump steadily for 2712 hours, with no trouble, and not one cent for repairs—and he is only one of many.

Pomona Deep Well Pumps *are efficient —reliable*

navel type, and the flattened wrinkled shape of the common Australian navel type fruits.

The size of fruits is another type characteristic, as for instance the standard ivory white Marsh's seedless grape fruit type in comparison with the large seeded type of this variety.

The texture of the rind of fruits is another important type character, as in the case of the rough ridged Valencia type in comparison with the wrinkled type, the standard type and the very smooth small fruit Valencia orange type. Also the corrugated navel type in comparison with the ribbed, the smooth Thomson, and the coarse rough Australian types.

The number of seeds is still another most important type character, as in the case of the seeded Marsh's seedless grape fruit type having from fifty to sixty seeds in each fruit, and the standard type having but one or two seeds per fruit. In all the types of the varieties under observation we find seedless types and seeded types, the average number of seeds being a clear cut type characteristic.

The time of fruiting varies according to type, as for instance some types of Eureka lemons bear fruit ready for picking in the fall, others produce their crop in the spring and summer while other types produce fruits all the year.

The thickness of rind, amount of rag, sugar and acid content and amount of juice, flavor and other characters we find to be correlated with type characteristics.

By all means the most important type character is the amount of production. Production we have found to be correlated with types in all varieties, some being characteristically large and others small bearers. In the orchards under observation the elimination of all unproductive types and a substitution of the productive types would mean an increase of one hundred per cent in production and a corresponding improvement of the commercial quality of the crops.

We have found as a rule that the heaviest producing types produce the best and most valuable commercial fruits. The importance of this discovery can be readily appreciated by all growers.

Our records of comparative type behavior will prove of great interest to citrus growers. A personal inspection of these types in the orchards and a study of their characteristics will certainly be beneficial to all orchardists.

(To be continued).

Olives are being put up by the Hemet cannery this year for the first time.

PHOSPHATE ROCK IN FLORIDA

In 1894 Florida as a producer of phosphate rock outstripped South Carolina, which, prior to the development of the Florida deposits, had enjoyed a practical monopoly of phosphate rock mining. The value of the phosphate production of Florida now approximates $10,000,000 annually. In the early days of the industry in Florida four kinds of phosphate rock were produced, namely, hard rock, soft rock, land pebble, and river pebble. Soft rock, which is of a much lower grade than the other types, has not been mined for several years, and only an insignificant amount of river pebble is produced at the present time. Land pebble constitutes approximately 80 per cent of the total quantity produced, but only about two-thirds of the total value. Hard rock is generally of higher grade than pebble and brings about twice as much per ton to the producers.

Hard Rock Most Valuable

At one time the only phosphate for which there was any demand for export was hard rock, but in recent years the grade of land pebble has been materially improved by methods of mining and treatment before shipment, and the exports of the Florida rock now include not only practically all the hard rock produced but also about one-third of the land pebble. The total production of hard rock in 1913 was 489,794 long tons, valued at $2,987,274, an average of $6.10 a ton. The production of pebble, which includes an insignificant quantity of river pebble, was 2,055,482 long tons, valued at $6,575,810, an average of $3.20 a ton. Florida's relative importance as a producer of phosphate rock is indicated by the fact that both in quantity and value it contributes more than 80 per cent of the total production of phosphate rock in the United States.

CITRUS CANKER

Replying to an inquiry from Florida, we recently gave some information on citrus canker. In addition, we wrote to Prof. Fawcett, who has had wide experience in Florida orchards, and asked regarding this trouble. He writes:

"In reply to your letter of October 19th, in regard to citrus canker, this is being thoroughly investigated by the Florida experiment station and by some of the pathologists of some of the Gulf States. The following bulletins and publications have been issued on this subject: Citrus Canker Bulletin 122, Florida agricultural experiment station; Circular 27, Alabama agricultural experiment station; Bulletin 150, Lousiana agricultural experiment station, and an article on citrus canker in the proceedings of the Florida State Horticultural Society for 1914. The Florida Grower has published some recent information in regard to this subject in Florida. Judging from these in the Grower I do not think there is any remedy advocated other than the entire destruction of the tree.

"As regards your question about the probability of the pest being introduced into California under present conditions, I do not believe there is any danger under our quarantine laws."

Deciduous Fruits

MARKETING THE APPLE CROP

According to the office of markets, department of agriculture, present indications are that the commercial apple crop of the United States is much larger this year than last, but less than that of 1912 by several million barrels. However, it is estimated in the current number of the Agricultural Outlook of the department that the problem of distribution will prove to be more complex than two years ago, owing to certain conditions resulting from the European war.

Attention is called to the small quantity of American apples — less than 2,000,000 barrels—taken by Europe in normal times. Both the growers and dealers are urged to view the situation with optimism and to prepare for the disposal of Europe's usual portion in other ways. It is suggested that with judicious handling the demand at home may be increased and the commercial crop marketed with relatively fair success to all. As to just what constitutes judicious handling the office of markets makes the following suggestions:

Growers should pick the fruit in uniform condition, gleaning the trees only for what is ready to come off, repeating the process until the crop is harvested. The advantage is to secure a longer time for distribution and to prevent the pack from representing extreme stages of maturity ranging from ripe to green.

When picked the fruit should be handled from orchard to cars in such a way as to prevent deterioration, care being exercised to protect the apples from the elements. It is explained that under proper conditions fruit which is picked today should not be packed until tomorow, and that for this purpose shelter should be provided.

Inferior grades should be eliminated from the green fruit markets, not only for the reason that the demand for such grades will be very limited, but also because their presence in the markets will undoubtedly hamper profitable disposition of the better fruit.

All apple growers, operators, dealers and associations should early arrive at an estimate of true values in order to secure a quick movement. It is explained that if arbitrarily high prices rule in the beginning of the season the crop will not pass readily into consumption, but that on the other hand abnormal accumulation and congestion will occur throughout the channels of trade with disastrous results to all concerned.

Only standard varieties well packed should be placed in cold storage for the reason that prices likely to rule in the late fall and early winter, as the inevitable result of liberal offerings of common storage stock, will probably limit the demand for cold storage apples until midwinter.

An effort should be made to fully supply small towns by direct sales in order to secure a more uniform distribution and avoid congesting the large markets. Attention is called to the practice in some sections of growers who go with cars of apples to poorly supplied towns and sell on the track. Growers or dealers who desire to use this system should apply to the town and railway authorities for information as to regulations controlling such sales, and if conditions justify shipping the arrival of the car should be preceded by judicious advertising.

Growers who live in communities where cooperative organizations are active should do all possible to strengthen these exchanges. It is asserted that the disloyalty of members is the chief element of failure in cooperative enterprises, and growers are strongly urged to support their association as the best way to effect satisfactory distribution.

Those who grade, pack and brand their packages in accordance with provisions of the Sulzer law should be more successful in making quick and satisfactory sales than otherwise. When apples are packed in a standard barrel as established by section 1 of the Sulzer law, and are plainly and conspicuously marked as containing one barrel of apples of one of the standard grades described in section 2, such a statement, if true, would constitute a satisfactoy compliance with the net weight amendment to the food and drugs act. Otherwise the package, if intended for interstate commerce, must be marked to comply with the net weight amendment to show the quantity of the contents, either by weight or by dry measure or by numerical count. A statement of numerical count must be qualified by the size of the apples expressed as the average diameter in inches to be a statement of quantity.

With respect to Europe, the office of markets urges exporters to carefully watch the movement and assure themselves of steamer space and a demand on the other side before making shipments. Latest announcements of steamship companies are to the effect that fairly regular schedules will be maintained between America and the United Kingdom. American apple shippers are advised to stimulate the demand and increase their shipments to Latin America and the Orient.

For the benefit of those who may not be disposed to exercise especial care in handling the crop, on the grounds that it will not be worth while, the office of markets suggests it as probably being true of this year that not only proper handling, but also great diligence will be required for effecting satisfactory distribution.

CONCENTRATED APPLE CIDER

The specialists of the fruit and vegetable utilization laboratory of the department of agriculture have completed arrangements for a commercial test of the recently discovered method of concentrating apple cider by freezing and centrifugal methods. As a result a cider mill in the Hood River Valley, Oregon, will this fall undertake to manufacture and test on the retail market 1000 gallons of concentrated cider, which will represent 5000 gallons of ordinary apple cider with only the water removed.

The new method it is believed makes possible the concentrating of cider in such a way that it will keep better than raw cider and also be so reduced in bulk that it can be shipped profitably long distances from the apple growing regions. The old attempts to concentrate cider by boiling have been failures because heat destroys the delicate flavor. Under the new method nothing is taken from the cider but the water, and the resultant product is a thick liquid which contains all the apple juice products and which can be restored to excellent sweet cider by the simple addition of four parts of water. The shippers and consumers, therefore, avoid paying freight on the water in ordinary cider. In addition,

Roeding's

True Trees Yield Profitable Crops

As it would be foolish to expect to gather figs from thistles—so is it impossible to get fancy fruit from inferior trees.

You know that it is the extra fancy fruit that brings the grower his largest profits and so it should be the aim of every planter to make his trees produce the largest, choicest, best looking fruit.

To do this requires a good start.

FOR over 30 years we have been growing nnursery stock in this State. Our nurseries comprise over 2000 acres and are located in the spots most favored by climate and soil for the propagation of perfect stock. We have been constantly on the watch for new methods and new varieties. We have been searching this country and Europe for anything and everything that would help the fruit interest of this great State. We have been always in the foreground—always working and fighting for cleaner, better, truer nursery stock.

Today we offer you the benefit of our large organization and many years' experience.

TREES

We have the finest and most complete stock of

Fruit and Ornamental

trees, vines, shrubs and plants that it has ever been our good fortune to offer. We can fill your orders complete, no matter how small or how large—and we believe this is the **only** nursery on the Pacific Coast that **can** fill your orders complete.

Send us Your List for Prices and Suggestions

We will be glad to advise with you without any obligation on your part as to what is most suited to your soil and climate. Being in close touch with markets, we will also be glad to advise with you as to what will probably be the most profitable varieties for you to plant this coming season. Send us your list for prices. Get in touch with us today. We can advise with you much more fully now than if you wait until our busy season commences.

Wilson Trees Are What I Want !!

This is the Slogan or Demand made by all Tree Planters wanting the best Nursery Stock that Money will buy. The individual attention given the propagating end of our extensive business by Frank H. Wilson, President of The Fresno Nursery Co., Inc., who supervises the gathering of all propagating wood from the very best Orchards and Vineyards of the state, insuring the best strain of tree, and grape vine, is THE REASON for demanding WILSON stock.

Submit a list of your Needs for special quotations, meanwhile send for our Large 52-Page Catalog. It's Free for the Asking. Our Catalog, in addition to Fruit descriptions, gives complete planting instructions.

Our Stock of the following varieties is complete:

Almonds
Apples
Pears
Cherries
Grafted Walnuts
Figs
Hardy Ornamentals

Citrus Trees
Apricots
Plums
Prunes
Olives

Lilly's Soluble Sulphur Compound

The Sulphur Spray in Dry Form

Manufactured on the Pacific Coast Under Niagara Patents

This is the Soluble Sulphur Compound tried and proved by three years use throughout the United States and Canada, and particularly in Oregon and Washington.

Attempts are being made to use the reputation of our compound to market a crude substitute—a caustic soda compound of low sulphur content—under a similar name. Beware of such inferior products.

LILLY'S, the only authorized and genuine article, will be placed on the California market through San Francisco and Los Angeles.

the product when properly barreled, because of its higher amount of sugar, keeps better than raw cider, which quickly turns to vinegar.

The process as described by the department's specialists consists of freezing ordinary cider solid. The cider ice is then crushed and put into centrifugal machines such as are used in making cane sugar. When the cider ice is whirled rapidly the concentrated juice is thrown off and collected. The water remains in the machine as ice.

At ordinary household refrigerator temperatures this syrup-like cider will keep perfectly for a month or six weeks, and if kept at low temperatures in cold storage will keep for prolonged periods. At ordinary house temperatures it, of course, will keep a shorter time.

To make the concentrated syrup, the cider mill must add to its equipment an ice-making machine and centrifugal machinery, so that the process is not practicable on a small scale. The specialists are hopeful, however, that the commercial test soon to be inaugurated in Oregon will show that it will be possible for apple growers to concentrate their excess cider and ship it profitably to the far south or to other non-producing regions. The specialists also believe that it will enable apple producers to prolong the market for cider.

PEACH TROUBLES

Written for California Cultivator
By J. W. Mills

Queries have come to us from Southern California regarding young peach trees dying and big and little peaches on the same tree.

As to the former we will say that there are many reasons for peach trees dying and one that causes a slow death in many cases is root knot.

About the period of 1897, Southern California was very dry, and the wet season following brought some serious peach troubles, perhaps, more correctly speaking, troubles originating during the dry season began to come to a climax during the wet period. Many promising peach orchards near Pomona were affected wtih dieback, and cases of trees setting good crops that failed to make good sizes were common. Some trees would have large and small fruit all over them. Our observation convinced us that the small fruits were the result of delayed bloom. Some of the blossom buds would not open till the first had set fruit. This we were convinced was due to warm growing weather in February and March, followed by cold chilling weather. We had peach trees that bloomed and matured some inferior fruit on branches that never put out a leaf during the whole growing season. One season some peach trees were still producing blossoms in July. These never matured fruit; but the small fruit that grew on the trees with large fruit was undoubtedly the result of slightly delayed bloom. This trouble will devitalize the tree if kept up for a number of consecutive years and the trees will die a slow death. Should cold weather continue into late spring the peach tree will come up to normal behavior again. This was our experience during our 14 years of observation in Southern California. We also observed that peach varieties that were native to the south were not affected in this way. For instance, Jewell, Pansy Pabor, Countess, Belle of Georgia and others of this class came out in bloom and leaf and kept on growing regardless of the weather and always matured normal crops of fruit.

DRONE TREES IN ORCHARDS

I enclose a copy of a recent letter appearing in the Rural New-Yorker. The experience of the writer of this letter in top working drone trees is very interesting to me in its relation to our work along similar lines with the citrus. We have had comparable results to those of the writer of this letter, in that we have not failed in a single case as yet to replace drone citrus trees with productive citrus trees by rebudding the drone trees with buds taken from productive types.

It occurred to me that in view of the interest of many citrus growers in work of this character, you might wish to publish this letter as a matter of general information on this subject.—A. D. Shamel.

* * *

"Every orchardist nas drone trees unless exceptionally fortunate. My own share of them has been more than liberal, and since they are usually of strong and vigorous growth, my plan has been to put new tops on them by selecting buds from trees that were satisfactory producers. The method used has been to prune severely in spring and force out a liberal growth of shoots on the stem of the tree. These shoots are budded during the ensuing summer and allowed to start into growth the same season and continue such growth during the following year. Then the top of the tree is sawed off just above the strongest bud-shoot, which is usually one of the uppermost. From six to a dozen buds are usually put in, and the new shoots are from three to six feet in length when the top is taken off. After that growth is rapid and bearing soon begins. A number of trees on my place, peach, pear, plum, persimmon and pecan, have been treated in this way, and in every instance subsequent fruitage has met expectation. A season seldom passes that one or more trees are not worked in this way. No longer ago than last April a lusty young persimmon and strong-growing eight-year-old Mobile pecan were worked with dormant buds, not because they were drones, for they were both exceedingly prolific; but their fruitage was inferior. The stems of these trees are now bristling with bud-shoots two to four feet in length, while about one-fourth of the original top is still growing and fruiting above. When the remainder of these tops is taken off next spring these bud-shoots will grow surprisingly fast and new fruits will be expected a season later. Then if the new persimmons and new pecans are not approximately equal in quality to those produced by the mother trees from which the buds were taken, it will be the first failure in a long experience.

"To dig up or cut out a healthy, strong-growing drone tree is a waste. Why, indeed, may they not be budded as readily and with as good results as an ordinary small seedling? The 'scientists' who deny this have gone foul on their science. On the drone tree proposition I am prepared to show the goods in quantity sufficient to convince the most obtuse or incredulous Missourian."

Hot lemonade is one of the best remedies in the world for a cold. It acts promptly and effectively and has no unpleasant after effects.

CORRECT COST OF ORCHARD MANAGEMENT

What does it cost to run an orchard? A plan of cost accounting for apple orchard operations for fruit growers wishing to find out the annual cost of managing an orchard has been outlined by the United States department of agriculture. The method presented is the result of records covering 19 years' work in several New York orchards. The bulletin gives details for two years' work on one of these orchards. The method is applicable to all similar operations. The result of the study is given in great detail in the department's new bulletin (No. 130), entitled "Operating Costs of a Well-Established New York Apple Orchard."

The orchard for which the details are given is over 50 years old and well located for the production of fruit. It consists of nearly 15 acres and contains 527 trees. The total annual cost of the operation of the orchard during the two years covered by the detailed studies was divided into labor, cash, and fixed costs. Nine hundred and thirty-seven marketable barrels of apples were produced the first season for a total operating cost of $1,217.92. Two thousand one hundred and four barrels were produced the second year at a total expense of $2,125.69. In the table given below, the labor costs refer to the man and horse labor; the cash costs cover the expense of manure, spraying, barrels and seed for cover crop; the fixed costs include the use of machinery, land rental and overhead expenses. The distribution of costs in the orchard during the two years was as follows:

	FIRST YEAR				SECOND YEAR			
Item of cost.	Total.	Per Acre.	Per Tree.	Per Barrel.	Total.	Per Acre.	Per Tree.	Per Barrel.
Labor	$ 504.91	$34.254	$0.958	$0.539	$ 856.66	$ 58.118	$1.625	$0.407
Cash	418.10	28.364	.793	.446	966.57	65.574	1.834	.459
Fixed cost	294.91	20.007	.559	.315	302.46	20.520	.574	.144
Total	$1,217.92	$82.625	$2.310	$1.300	$2,125.69	$144.212	$4.033	$1.010

Two elements of cost have not been measured in these estimates—namely, the cost of creating the orchard and the depreciation of the orchard as its production declines as the result of advancing age. The presence of insect pests and fungous diseases and the thoroughness of their control also will have their influence on the life of the orchard. The two years' study on the farm in question have not yielded sufficient data on this particular item to warrant definite conclusions. All apple growers, therefore, should bear this factor in mind.

The item included under "fixed" costs should vary little from year to year. The land rental, including interest and taxes, is about 6 per cent. For this particular orchard it will be noted that the fixed costs approximate $20 a year per acre.

The details of the items of cash costs are as follows:

CASH COSTS ON 14.74-ACRE APPLE ORCHARD, CONTAINING 527 TREES, FOR TWO YEARS

FIRST YEAR		Distribution of Cost.			
Item of Cost.	Spray.	Total.	Per Acre.	Per Tree.	Per Barrel.
Manure charge (50 per cent against 1911 apples)	.....	$ 30.77	$ 2.087	$0.058	$0.033
Spray materials used:					
First spraying—					
Lime and sulphur, 40 gallons at $0.04 (1)	$ 1.60				
Lime and sulphur, 100 gallons at $0.16 (2)	16.00				
Tobacco extract, 3 pints at $1.562	4.69				
Lead arsenate, 32 pounds at $0.08	2.56	24.85	1.686	.047	.026
Second spraying—					
Lime and sulphur, 43 gallons at $0.16	6.88				
Lead arsenate, 102 pounds at $0.08	8.16	15.04	1.020	.029	.016
Third spraying—					
Lime and sulphur, 32 gallons at $0.16	5.12

Lead arsenate, 36 pounds at $0.08	2.88	5.28	.358	.010	.006
Barrels, 937 at $0.311	....	291.41	19.770	.553	.311
Seed for cover crop (3)	....	39.47	2.678	.075	.042
Total for season	$	$418.10	$28.364	$0.793	$0.446
SECOND YEAR					
Manure charge (30 per cent against 1912 apples)	....	18.46	1.252	.035	.009
Spray materials used:					
First spraying—					
Lime and sulphur, 80 gallons at $0.04	3.20				
Lime and sulphur, 75 gallons at $0.14	10.50	13.70	.929	.026	.006
Second spraying—					
Lime and sulphur, 44 gallons at $0.14	6.16				
Lead arsenate, 105 pounds at $0.08	8.40	14.56	.988	.028	.007
Third spraying—					
Lime and sulphur, 52.5 gallons at $0.14	7.35				
Lead arsenate, 126 pounds at $0.08	10.08	17.43	1.182	.033	.008
Fourth spraying—					
Lime and sulphur, 35 gallons at $0.14	4.90				
Lead arsenate, 146.75 pounds at $0.08	11.74	16.64	1.129	.031	.008
Barrels, 2,104 at $0.421	....	885.78	60.094	1.681	.421
Total for season	.....	$966.57	$65.574	$1.834	$0.459

---

(1) Undiluted homemade solution: 36 pounds of lime, 80 pounds of sulphur and 50 gallons of water. The cost of labor is included. Rate of dilution, one gallon of lime and sulphur solution to seven gallons of water.

(2) Undiluted commercial lime and sulphur: Rate of dilution, one gallon of lime and sulphur solution to ten gallons of water.

(3) Items of seed cost: Clover, 180 pounds at 16 cents; oats, 22 bushels at 40 cents; turnips, 7.5 pounds at 25 cents.

Other Sources of Farm Income

The cost of growing apples is lessened by growing them in connection with other farm crops and utilizing the man and horse labor on these other crops when they are not needed in the orchard. The experiences of the best apple growers in old apple-producing regions indicate that proper management of a well-diversified farm is as important a factor in profitable apple raising as the use of different cultural methods, reduction of packing cost, or even cheaper wages for help.

The farm in question consists of 122 acres. Fifty per cent of this area is devoted to general crops other than fruit, and of the 39 acres devoted to fruit only about 15 are used for apple raising. Enough hay, oats and corn are raised on the farm for feed. Potatoes are raised, but only for home use. Wheat and beans, as well as the fruit, are cash crops. Each year 20 or 30 sheep are kept and pastured during the summer. Lambs are raised and fattened during the early spring months. Six horses are kept for work and one for family use. One or two colts are raised each year.

The actual costs given are not the most important result of this study, as other farms in the same community might show quite different results. The method of analyzing the various cost factors is the feature that is of most practical value. The department's new publication aims to outline for the independent apple grower a method that will enable him to determine the actual cost of maintaining and operating his fruit enterprise on his own farm. It does not attempt to give a concrete example of just what the costs will be. Beside the fact of the depreciation of the apple orchard already mentioned, other factors, such as the variety, age and size trees, the soils and the climate will influence the actual costs, but not the method of analyzing these costs. Apple growers will find much to interest them in the new publication which is being sent free of charge to such persons as apply for it.

A Better Make Not Made

Self Payers

The pump you buy should raise the maximum quantity at the lowest cost per gallon, run constantly without repairs and with minimum attention.

"JACKSON MADE" PUMPS not only do this, but they are self-payers because their saving in power and repairs will pay their first cost in a very few months.

There is a "Jackson Made" Pump that will do the work you require at a lower cost than any other make.

Write us, tell us your pumping problems and our expert engineers will help you, free of cost.

DRAINAGE AND ALKALI RECLAMATION

(Continued from page 515)

a new drainage system on the west and north, which was installed in that year on the farms of J. and Fred W. Hansen. This new system will be considered later.

Fresno Drainage Survey of 1902.

In 1902 a general drainage survey was made in the vicinity of Fresno by Prof. O. V. P. Stout, under the general direction of Mr. Elwood Mead, then chief of irrigation investigations in the department of agriculture, in order to understand the engineering problems involved in the proper drainage of this region, the necessity of drainage being so evident that it was assumed. As a result of this survey two general plans for the relief of about 18,000 acres south and west of Fresno were prepared by Mr. C. G. Elliott, then chief of drainage investigations. One plan involved eight parallel open drains one-half mile apart extending from the eastern boundary of the district west to an intercepting drain leading to Fresno slough, 20 miles distant. The second plan considered dividing the proposed drainage district into 18 sub-districts, averaging in size from 800 to 1700 acres. Parallel lines of tile from 8 to 22 inches in diameter were to take the place of the open drains in the first plan. Instead of being carried 20 miles in a drainage channel leading to Fresno slough, the drainage water was to be pumped from collecting sumps to the various irrigation canals. The estimated acre-cost of the tile system was $13 to $14, with that of the open system possibly a little larger. No action was taken by the Fresno farmers as a result of his survey and report.

Experiments on the Dore and Baker Tracts.

In 1906 additional work was undertaken by the irrigation investigations and the state engineering department of California in the Fresno lands needing drainage, the purpose this time being to show experimentally the benefits of drainage. Two tracts were selected for experiments, one of 20 acres at North and Elm avenues, known as the Baker Tract, and one of 40 acres on the farm of Mr. John S. Dore, three and one-half miles west and one-half mile south of the Baker tract. The Baker tract is underlain unevenly with hardpan, and the accumulation of alkali was thought to be as heavy as on any other tract in the affected district. About one-half of the tract had never produced crops of any kind and practically no profits had been obtained from the rest for several years. The Dore tract, on the other hand, was a finely kept vineyard that had been very profitable, but that had begun to fail rapidly, about one-fourth of the vines being already dead.

The plans of the experiments on the Baker and Dore tracts and the immediate results obtained are fully discussed in Bulletin 217 of the office of experiment stations of the department of agriculture. Both experiments involved the laying of main and lateral tile lines, ranging from eight inches down to four inches in diameter, and leading to sumps from which the drainage water could be lifted by electric pumping plants and carried to near-by irrigation canals. The least depth at which the tile was laid was 3.5 feet, the average depth being 4.5 feet and the outlets into the sumps being six or seven feet below the surface. The local difficulties encountered are fully detailed in the bulletin mentioned, including the necessity for blasting the hardpan on part of the Baker tract at a cost of about $10 to about $14 per acre. After the tile and pumping systems had been completed both tracts were flooded to a depth of about 12 or more inches. The Baker tract was flooded intermittently through the spring of 1907. On the Dore tract flooding occurred for 10 days, the first spring, and from the following fall to the first week in March, 1908.

Following the flooding and the operation of the pumping plant on this tract a marked improvement was apparent in the color and tilth of the soil. Two small tracts were planted to Muscat vines, practically all of which lived and made a healthy growth throughout the first summer. The remainder of the tract was seeded about June 1, four acres planted to sorghum growing spotted patches of fodder eight or nine feet high and yielding 1.5 tons per acre, the spotting being due to the presence of hardpan on the one hand and to the breaking up of some of this hardpan by blasting on the other. This tract has not been flooded since the time of the experiment in 1907 and 1908 and the pump has not been operated by the owner of the tract since 1909. Neither has the owner made any effort to cultivate or crop it since then, with the exception of seeding a small portion to barley the first season after the experiment was concluded. At present the tract is abandoned to Bermuda and salt grass pasture and to the casual observer indicates a total failure of the experiment. But an examination of the tract, interviews with those who are familiar with it, and interviews with the owner suggest the very evident conclusion that in spite of the exceedingly poor soil involved, largely due to the unfavorable hardpan condition, the plan of drainage was entirely satisfactory and that if it had been persisted in by the owner, instead of encouraging a return to Bermuda pastue, a permanent improvement would have resulted over at least a portion of the 20 acres. Rather than demonstrating the failure of drainage in this section, it is believed that the experiment on the Baker tract shows, first, that there are difficulties connected with drainage of the very poor land, and second, that thorough and persistent farming is as necessary as a good tile system.

Dore Tract.

When the experiment was undertaken on this tract in 1907 it was estimated by the owner that at the rate the vines were then dying the entire 40 acres would become unproductive from the rise of ground water and alkali within a few years. Of 1000 young vines set out in April, 1908, after flooding and draining, 95 per cent made a very strong growth and lived. In addition old vines that had practically ceased to throw out shoots began to do so, although these nearly-dead vines ultimately succumbed. The old producing vines made a more healthy growth than for several years, remaining green throughout the summer instead of turning yellow with the first hot days of June, as before. According to Mr. Dore, an equally marked effect was then and has since been produced on the quantity and quality of the yield. The experiment was concluded by the irrigation investigations in 1909, but the tract has been revisited by the writer. The land has been neither flooded nor irrigated since 1908, and no new plantings of vines have been made later than one year following the period of the experiment. Some more of the old producing vines have died, several acres of the land thus bared being planted to pomegranates. Some of the pomegranates have also died, but these were located alike in the land most free from and most charged with alkali, and the owner attributes their failure to causes other than alkali which he cannot explain. But the young vines that have been planted and that have not been injured by other causes have apparently made a highly satisfactory growth and beyond any question whatever demonstrate the entire success of the experiment. Some of the old vines are still dropping out in patches, and it is evident, so far as conclusions are warranted from casual observations, that the land, which has had absolutely no surface water since the experiment was in progress in 1908, other than light precipitation, needs additional leachings. Owing to the continued low price of raisins, Mr Dore has not been encouraged to replant his vineyard where vines are missing, believing that possibly alfalfa will be more profitable, considering all circumstances. Consequently results are not available for young vines over the entire 40 acres. Not one acre of Mr. Dore's tract has, however, gone back to pasture, for with the exception of a brief period each season when the ground water is highest throughout the district, the drainage pump has held it down to a safe level, in spite of the high level of ground water in all of the surrounding territory.

Drainage on Hansen Farm.

During the progress of the drainage experiments on the Baker and Dore tracts, part of the work was done at wages by a comparatively young farmer of the neighborhood who had seen his father's 40 acres grow from a land of tar weeds to a $20,000 vineyard and then back again, after the rise of ground water and alkali, until for an entire year prior to 1907 it was carried on the market without a buyer for about one-fifth of the former estimated value. What this farmer got out of his connection with the Baker and Dore tracts was more than his wages and his contract price for pumping water during the construction period. He got a knowledge of how to drain and an appreciation of the results that could be made to follow. He already had 20 acres of his own and about $600 in cash, and with the assistance of the irrigation investigations in laying out his system, set about draining his own 20 acres, 80 acres on the home ranch and an additional 20 acres adjoining which he purchased. Joining his neighbor on the south, whose 40-acre tract was in the original Taft-Hansen experiment of the bureau of soils, he changed the original position of the Taft-Hansen pumping plant, advanced $300 to the local power company to get their power line made accessible, and zig-zagged a six-inch and eight-inch line of tile through the property from northeast to southwest to the collecting sump and pumps. One six-inch lateral was run north into a corner of the 60-acre home place, and an eight-inch lateral was run east to tap the land of his co-operating neighbor.

This home-made drainage system on the Hansen farm was laid in October and November, 1908. In 1909 10 acres were leveed, flooded and seeded. This was added to by eight acres in 1910 and by 19 acres in 1911, and the work of flooding an additional 40 acres will be started as soon as water is available for the purpose in the canals. The acre-cost of the drainage system was $12 on the F. W. Hansen 40 acres and $15 on the remaining 80. Nineteen of the 20 acres purchased on borrowed money in 1908 in 1912 yielded seven tons of alfalfa per acre, according to the figures of the owner, which sold for $10 per ton, or a total of five times the original cost of the drainage system for the same area. This land was seeded in 1909 and 1910. Another 19 acres seeded in the spring of 1912 and lying at the far diagonal corner of the tract, in the same season gave a measured yield of 90 tons of alfalfa, which if sold at the price brought by the alfalfa from the other 19 acres, viz., $10 per ton, would have paid the purchase price of the 20 acres of which the 19 acres is a part, plus the original cost of the tile drains. This land had been flooded and drained for three years prior to seeding. Of the 19 acres, eight acres has received its entire irrigation water — it was irrigated heavily four times in 1912 — from the drainage pump, sustaining so far as is possible with one season's work the conclusion of those who have from the first maintained, after numerous analyses of the drainage water, that the drainage water here is entirely satisfactory for irrigation. Starting in 1908 with 40 acres and a debt of $1800, this farmer, by applying knowledge he had gained through his connection with the Baker and Dore experiments, has in less than five years cleared his debt, built one barn and repaired another, and maintained a family of seven children from the profits of land that before drainage had an approximate value, as estimated by a conservative Fresno banker, of about $50 per acre. Of the land drained by the cooperating neighbor, 16 acres of alfalfa seeded in 1910 yielded an estimated 100 tons in 1911 and an estimated 112 tons in 1912. A near-by 20 acres, which is underlain with tile, but from which no water has been pumped for three years, is in salt and Bermuda grasses, yielding at the most seven or eight months of pasture at the rate of about two acres per cow.

The formation of one or more drainage districts about Fresno has frequently been suggested. In fact, our drainage district act was drafted with conditions here especially in view. It is believed that the time has never been more opportune for action and accomplishment than now.

NOT FOR THEM

"Colonel," said the book agent, "those are mighty fine boys of yours."

"The finest ever, stranger," acquiesced the colonel. "The finest in Texas."

"I reckon you buy them anything they want!'

"Why sure, stranger,; I buy them anything they need, whether they want it or not."

"Then, colonel, let me sell you a cyclopaedia for them. There's nothing else that will benefit them so much."

The colonel looked at the agent in astonishment.

"Why, stranger," said he, "them boys of mine don't need no cyclopaedia. They ride mules."

Plant Pears for profit. California Bartlett ripen earlier than Eastern and Northwestern grown pears. During their season they monopolize the markets of the United States and Canada.

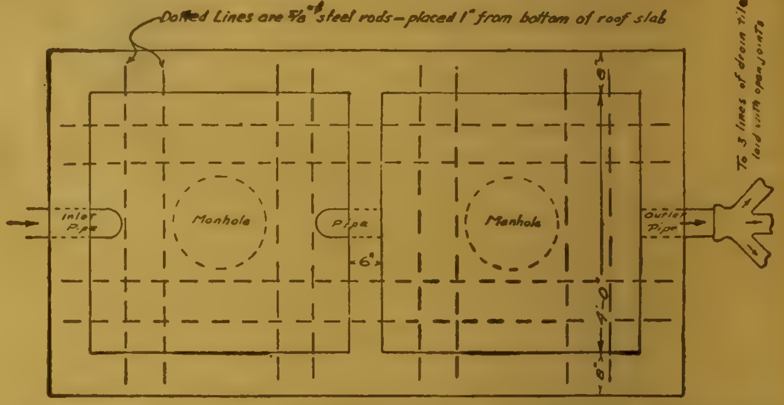
CONCRETE SEPTIC TANKS

THE well-managed farm of today means many household conveniences as well as labor-saving farm machinery. Back-breaking drudgery has been largely eliminated from both house and fields. Running water and the kitchen sink and bathroom have supplanted the old-time pump and open, unsanitary drainage. But the most efficient disposal of sewage remained a problem until the concrete septic tank was invented. It is a simple, cheap and effective device, rapidly supplanting the drywell, with its constant menace of water pollution. In brief, there has come to the farmer his own little sewerage plant in concrete, which answers his purpose even better than large city works, for he has neither the tax nor repairs that always attach to a city sewer system.



Dotted Lines are 5/8" steel rods—placed 1" from bottom of roof slab

4'-0"
8"
To 3 lines of drain tile laid with open joints

FIG. 2. PLAN SHOWING PROPER POSITION OF REINFORCING RODS

The principle upon which the concrete septic tank operates is extremely interesting. It consists of a long, water-tight cistern through which sewage passes very slowly and evenly. Located underground, it is warm and dark, thus affording perfect conditions for the development of the bacteria or germs which clarify and render harmless the sewage. After passing through the septic tank, the sewage is practically free from all suspended matter and has the appearance of water. From the septic tank this clear effluent is discharged into three lines of ordinary farm drain tile.

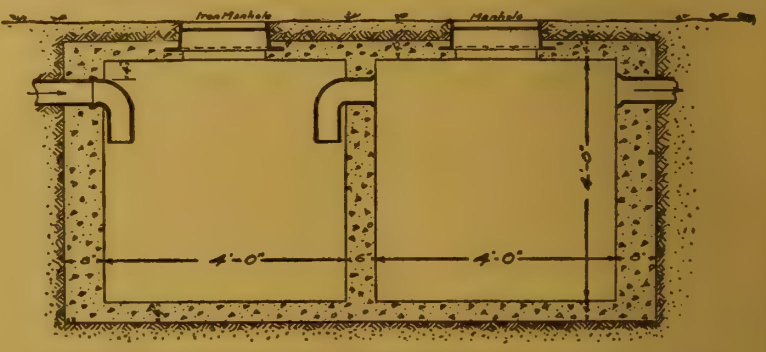

FIG. 1. CROSS SECTION INDICATING LOCATION OF PIPES

Size and Location of Tank

While the odor from a septic tank is scarcely noticeable, it is nevertheless best to locate it at some distance from the house. Choose a spot easy to excavate so that the top of the tank can be sunk six inches below ground level and where the lines of drain tile will have sufficient fall to carry off the discharge fluid. The tank should be large enough to hold the entire sewage for one day. For a family of eight to ten people occupying a house two bathrooms fitted with the customary appliances in the way of tubs and stationary washstands and downstairs the kitchen sink, a concrete tank having two compartments, each four feet long by four feet wide by four feet high, will be required. Since the top and bottom are each four inches thick and the top of the tank is six inches below ground level, dig the pit five feet two inches in depth. The walls of the tank are eight inches thick and the partition between the two compartments six inches. Therefore, the length of the pit should be nine feet ten inches and the width five feet four inches.

Making Forms and Placing Concrete

If the earthen walls of the pit stand firm only inside forms will be needed. These inside forms are merely boxes made of one-inch boards. Two boxes will be required to make two compartments. The outside dimensions of the boxes should be four feet square by four feet high. The boxes or forms will be placed on the freshly laid concrete floor. Holes for taking six-inch pipe should be made in the boxes as shown in Fig. 1. The holes should be four inches from the top of the box form, measuring from the top of the hole. The concrete should be mixed in the proportion of one part Portland cement, two parts sand and four parts crushed rock or gravel. Place a four-inch thickness of concrete in the bottom of the pit to form the floor of the tanks. On top of this concrete set the box forms, which should be ready for immediate use. Place the forms so that there is a space of six inches between them and an eight-inch space between them and the earthen walls of the pit. Then commence depositing the concrete for the walls and partition. As soon as the level of the concrete reaches the holes in the forms place in the holes six-inch pipes as illustrated. Then continue the concreting until even with the top of the forms.

Reinforced Top and Manholes

Two ordinary iron manhole frames and covers may be obtained from a local dealer in building supplies. The manhole covers should fit tightly and should not be perforated. The manhole frames should be ten inches high so that when placed on top of the forms the upper edge will be even with ground level. If the manhole frame is of less height than this, it should rest on a circular piece of one-inch board which is nailed to the top of the form. Since the concrete roof is to be self-supporting, it will be necessary to reinforce it with a few lengths of three-eighths-inch round steel rods. There will be needed four pieces of three-eighths-inch rods nine feet six inches long, and eight pieces five feet long. The roof is now ready to be placed. Place the manhole frames in proper position on top of the forms and deposit the concrete to a depth of one inch and on the concrete lay the long and short bars as shown in Fig. 2. When the bars are placed, deposit the balance of the concrete so as to bring the roof to a total thickness of four inches. As it will be covered with earth it is not necessary to give this top surface a smooth finish, merely level the surface by striking off with a straight piece of board. The tank should now be allowed to rest undisturbed for at least two weeks. At the expiration of this time, saw away wooden top of the forms inside of the manhole frames. Then enter the tank and remove the wooden forms, passing the lumber out the manhole opening. While in the tank make certain that the pipes are all unobstructed and not even partially clogged with dirt or lumber. The inlet pipe is then connected to the pipe from the house and the outlet pipe joined to three lines of three-inch concrete drain tile. The drain tile will be laid about twelve inches below the surface of the ground and joints left open, that is to say, no mortar must be used in the joints. This permits the discharged fluids to be absorbed by the surrounding soil. The drain tile lines should be laid in the form of the letter "Y" and sufficiently extended to cover a large area of ground. Average conditions require that each arm be about 100 feet long. After this is done, cover the tank with earth to the level of the manhole covers. It is now ready for use.

It is sometimes the custom to plant a few shrubs around the manhole openings, thus effectually hiding all evidence of the tank.

Materials Necessary

A tank of the size specified will require about four cubic yards of crushed rock, two cubic yards of sand and seven barrels of Portland cement. There will also be needed 78 feet of three-eighth-inch round steel rods, which can be obtained from the local blacksmith or hardware dealer. The tank can be built without skilled labor. It requires but few tools and construction methods are so simple that one man can easily build it.

CULTURE OF ASPARAGUS

Written for California Cultivator

By D. F. Reichard

ASPARAGUS is grown in California more than is generally known and is a very profitable crop. In the great central valleys it is grown for canning and shipping while fresh; in the Imperial it is grown mostly for shipping fresh, while near all the larger cities there are fields for local consumption. Although asparagus is maritime in origin and habit and supposed to grow only where the water level is not far from the surface, it is being grown with great success in the Imperial Valley with surface irrigation as its exclusive water supply.

The best soil for asparagus is deep, rich, sandy loam of a moist nature. The peat lands of Orange County or the reclaimed lands of the San Joaquin and Sacramento deltas are also ideal. For garden purposes heavier soils may be made suitable by free use of sand and manure well worked through it, but commercial planting should be made only on soil naturally adapted.

FROM A CALIFORNIA GARDEN AT THANKSGIVING

For large or commercial planting it is advisable to start from seed, while for garden purposes it is a saving of time and trouble to put in one or two year old sets. The seed should first be layered, that is started in a box filled with a layer of sand, then a layer of seed and so on, then wet down two or three times a day with warm water. After seven days the seed should be sprouting. The seed and sand together are sown into the seed beds which have already been made by thoroughly working up the soil. Make the rows three or four feet apart by raking out all lumps and clods, making a flat ditch about two inches deep and a foot wide. Cover the seed an inch with finely pulverized soil. The young plants should be up in a few days. The beds should be kept clean and moist. One pound of seed will sow about 250 feet in such a seed bed.

Another method is to sow the seed in drills in well prepared soil, having the rows far enough apart to cultivate to the best advantage. When the plants are up a few inches thin out to about two inches apart. One pound of seed will sow 400 to 500 feet of drill by this method.

The seed are sown from January to April and remain in the seed bed until the following winter when the roots are transplanted to the field. Well grown one-year-old plants do better in California than older ones for transplanting, although for garden culture older roots are used that picking may begin quicker. There should be no picking made until the plants are three years old.

When making large commercial plantings, the plants are given eight to ten feet between the rows and two feet apart in the row. In preparing the ground for the seedling, it should be plowed at least a foot deep and thoroughly harrowed, then the rows marked off. Throw two deep furrows away from each other, making a ditch about a foot deep; in the bottom of this run a narrow one-horse cultivator; on this freshly made bed set the young plants, covering them a couple of inches with dirt to hold them in place; if the soil is not naturally moist, the newly set plants should be irrigated to settle the soil around the roots. As the shoots begin to show gradually work the soil onto the plants until the field is level. This should cover the crown of the plants about six inches. After this first year furrows will be thrown together over the rows so as to make ridges about a foot deep over the crowns; this is what makes the fine, long, bleached asparagus shoots. The cutting is done by plunging a long gouge into the side of the ridge as the protrusion of a tip indicates the location of a shoot. Cut all the shoots clean at each cutting during the season which starts with the first warm weather in the spring until the first of June and sometimes a month later, always stopping in time to give the plants a chance to make foliage growth, that vitality may be gathered for the plants to make a good cut the following year.

When the foliage begins to die and turns brown it should be cut off and burned before the seed begin to drop, as the young seedlings will prove a great pest if allowed to get started in the field. As soon as the field is cleaned up it should be thoroughly cultivated and then covered with from five to ten tons of stable manure to an acre and left till early spring, when it should be well cultivated again and ridged up preparatory for the new harvest.

A sprinkling of salt over the field once a year is advisable if the soil does not already contain it.

ORANGES BY WATER

Arrangements are being made for the shipment of oranges by the Panama canal to begin in January. Orange growers hope for an enlarged market because of this lower shipping rate, especially to all parts of eastern and southeastern United States. With refrigeration it is thought the long time shipments will not be a serious factor.

IMPORTED STOCK

The pure bred livestock people of the United States who have been so active for the past few years in introducing some of the best blood of European farms and stables certainly have a great responsibility and a great opportunity in the present moment. It is very probable that for some years to come draft horses and even dairy animals will be in such reduced numbers in Europe that their export will be impossible. If such is the case it is perhaps time for American breeders to establish the fact that some of the best blood of the world now exists in this country. Why may it not be developed and from it an American strain which will be the superior or at least the equal of any imported blood?

"Imported" has heretofore been a word to conjure with. Let us make "Made in America" of even greater worth in our livestock as well as in our manufacturing industry.

OLIVE—COTTON SEED OIL

In a recent issue of the Weekly News Letter sent out under authority of the secretary of agriculture is an article headed "Use of Cotton Seed Oil." Good advice, for it is a most healthful food and one the consumption of which is increasing with great rapidity. But in one particular we feel the writer is unjust and unfair to one of California's great products, olive oil. We perhaps cannot take exception when he says, "As a matter of fact it is fully as nutritive as olive oil and on account of its bland flavor is actually preferred by many. It lacks, of course, the distinctive olive flavor which many persons, especially the Italians, find desirable." But the whole trend of the article is to prejudice against the use of olive oil. It does not refer to the fact that olive oil is produced in the United States, but does make comparisons of wholesome cotton seed oil with imported Italian oil. This naturally prejudices the reader in favor of American produced goods. The department of agriculture is not a sectional institution, and to send forth articles which are prejudicial to one of the purest foods products produced in America, we repeat, is unjust and unfair to a great industry. There is produced in California annually from 150,000 to 280,000 gallons of oil. Compared with the cotton seed oil industry, this is infinitely small. However, it is a growing industry which has been fostered by this state and the department of agriculture and is worthy of better treatment than is accorded it by the News Letter.

PROSPERITY OF ALL

At the last State Fruit Growers' Convention one of the speakers was criticised because he presumed to speak upon a vital topic when he was not directly engaged in fruit growing. There are a vast number of people in California whose interest in the fruit growing industry is as vital as the interest of those who have their hands on the plow or direct harvesting in the orchards. It has been quite common to criticise the activities of these who are claimed to be indirectly interested, but we believe a great help to the fruit growing industry would be removed were the membership in the state organization or participation in the state meetings restricted to those who actually till the soil. Others whose prosperity comes from the prosperity of the farming interests sometimes have more time to devote to the detail of the work than those who must be constantly watching the planting and cultivation and havesting operations.

We believe these state conventions should bring the fruit growers together formally to discuss the larger interests of their calling and listen to addresses by scientific men who have been trained to make investigations and can tell what they know in a way which will be instructive to the practical horticulturist. Several times during every state convention which has been held in the memory of the writer has the question been brought up, "We want more practical addresses by the practical horticulturist," but unfortunately the practical horticulturist is not always the practical talker. If he were there would be greater value in local meetings than there is today. We think the practical lessons should be referred more to these small meetings and the larger scientific problems brought out in the state conventions where the best talent of the entire country should be secured, and the fact that the scientific man is not a practical horticulturist in no way lessens the value of the information he brings. By "practical horticulturist" we mean now the actual soil tiller. It goes without saying that the scientific investigator must not be impractical.

THREATENING QUARANTINE

The International Livestock Exposition management writes that this famous show which was to have been held in Chicago November 28 to December 5 has been called off. Mr. B. H. Heide states that the yards and the entire livestock interests of the Northwest are uniting with the department of agriculture in crushing out the disease. He says:

"It is with extreme regret that I have to announce that the International Livestock Exposition for 1914 has been declared off by reason of the appearance of the dreaded 'foot and mouth' disease in the East and this Middle Western country. The federal government has taken the most careful and energetic action to confine the disease in the region of its appearance, and it has been deemed unwise to bring together the enormous crowds that flock to the 'International.'"

For the first time in 50 years there is not a hoof in the yards.

The Pacific International Livestock Exposition which will be held in the Union Stockyards at Portland, Oregon. December 7-12 announces that it has restricted exhibits to fat cattle classes, that is breeders will not be admitted to the exposition.

There have been five other outbreaks of the foot and mouth disease in former years, but all combined these did not cover the territory which this one attack developed with such wonderful swiftness. But the vigor which is being shown in the enforcement of a strict quarantine will doubtless result in early control. Surely every stock breeder will unite with the government in enforcing the quarantine.

To give an idea of the rigid quarantine; every herd which has shown any infection has been entirely destroyed no matter what the value of the breeding animals in the herd may be. The department allows compensation for animals destroyed on a beef basis.

UNSIGHT UNSEEN

Commenting on the foolish man who buys lands in new states without first making thorough investigation, a correspondent of the Rural New Yorker refers to the fact that in his own state of New York there are lands which have made their owners wonderfully prosperous while adjoining farms are so extremely poor that they cannot even pay expenses of upkeep. An editorial touching upon the same point adds:

"No, the land here mentioned is not in Florida or California, but right here in New York state. The same story might truthfully be told of any county in the country. This man lays down a large, solid chunk of gospel truth about real estate when he says that a buyer should come and see the land before buying. We cannot think of a more foolish thing than locating a home for the family on some unknown and unseen spot in order to save the expense of fair investigation. We have been criticised for taking this position. 'Do not interfere with the sale of real estate,' these critics say. 'Get all the new settlers you can; it is not your business to frighten them away or care if they are not satisfied.' A very short-sighted policy that. New York does not want any dissatisfied immigrants. They simply become what are known as 'knockers,' and there are too many such now. We want to see the farms of New York occupied by contented and prosperous people. There are good opportunities here, but the man must fit the farm in order to make a true combination and so—north, south, east or west—our advice is to see the land and study it before buying."

If this advice applies to settlers in New York it applies with double force in California. We do not want to increase the crop of knockers made from dissatisfied land buyers. There will be many a heartache caused by some subdivision schemes now being worked in this state. We hope we may soon have a law which will save many of these purchasers, but until we do, and even after, we will say that the unsight unseen method of buying is inherently wrong, for good land for one man may not prove profitable in the hands of another.

Agricultural Notes

Cuban and Isle of Pines fruit growers filled with exhibits one whole floor of the building in which has been recently held the Boston Food Fair.

The governors of Oregon and Massachusetts have suspended the hunting season this year because of increased danger of forest fires when the woods were exceptionally dry.

The bureau of chemistry of the department of agriculture is urging that all grain dust explosions be reported to it as that bureau is now engaged in special investigations to prevent damage from this cause.

Government officials have estimated that the people of this country spend annually five hundred million dollars for drugs and medicines. One exchange is unkind enough to call this the result of drug intoxication.

The Florida citrus fruit crop for the season 1914-15 is estimated at 9,000,000 boxes, of which oranges will make 5,250,000 boxes and grapefruit 3,750,000 boxes. This is the estimate based on reports from growers, shippers and big distributing firms at various points in the state.

To control the flood waters of the lower Rio Grande and utilize for irrigation purposes is the purpose of present agitation among American land owners of that section. It is hoped that joint federal control by Mexican and United States governments can be secured.

Agents of the Grand Trunk Pacific Railway are taking measures to get Belgian settlers for the territory opened by the company's lines in western Canada. It is expected that the European war will result in a rush of settlers to Canada. Belgian farmers are very thrifty people. It is hoped to settle a large tract in the Stuart river district.

Railroads leading from Richmond and Norfolk, Virginia, into North Corolina have reduced their interstate rates on potatoes and other vegetables. This reduction was made at the combined request of the Chambers of Commerce of Richmond, Norfolk and Petersburg. The former rates are restored. Two months ago the roads increased the rate by nearly 50 per cent.

Shipments of rare unnamed roses and other plants have been made from Luxemburg, France and Great Britain to be entered for the $1000 prize offered by the Panama-Pacific International Exposition for the most perfect new variety of rose. Those in charge of the two expositions say that while there is now no doubt that many European nations will be represented it is apparent that in addition there will be an unprecedented representation from South America and the Orient, as well as from Central America.

Agricultural News Notes of the Pacific Coast

Northern California

Better prices are being received for onions than for some time.

Petaluma's big poultry show opened November 19, closing on the 22nd.

Yolo County dairymen have formed an association, electing A. W. Morris president.

The Sonoma County Kennel Club held a dog show at Santa Rosa November 20-21.

The proposition to move the county seat of Butte County from Oroville to Chico failed to pass.

Tillie Alcartra, a Woodland dairy cow, has broken the world's record held by Creamelle Vale.

A group of farmers at Byron in Contra Costa County are planning an experiment with Kentucky hemp.

Meetings are being conducted in Mendocino County to arouse sentiment for appointment of a county farm adviser.

Olive prices in the district near Corning, Tehama County, range about $175 a ton. Two hundred dollars is being paid for Queens.

The rice harvest of Gridley, Butte County, shows grain of better quality than ever before. The cool fall ripened the grains slowly, filling the heads well.

Rice growers of Butte County are very much encouraged at the heavy yields shown by the harvest. A new rice mill is to be erected at Gridley with a capacity of 200 tons daily.

From present indications 10,000 acres in Yuba County will be sown to rice the coming year. The tule lands along the Yuba and Feather rivers have been found particularly adapted to its culture.

The 23 boy farmers who were given a continental trip as a reward for winning crop growing contests in high school classes have finished their trip. They visited Washington and New York on their tour.

Shasta County is in the middle of her olive harvest. Picking of Manzanillos is practically completed and just beginning on Missions. It is estimated that the crop will be 40 per cent larger than last year.

At the recent meeting of the Humboldt County Dairymen's Association several new members were added. The next meeting will be held in December at Loleta, at the same time as the meeting of the Loleta farm center.

Placer County is awaking to the benefits derived from a county farm adviser and to that end held a meeting recently and formed a farm bureau. Units of the bureau are to be formed at Mount Vernon, Gold Hill, Roseville, Long Valley, Loomis, Penryn, Sheridan, Lincoln, Edgewood, Applegate, Colfax, Dutch Flat, Bowman and Lone Star.

Directors of the farm bureau units of Solano County have perfected a permanent organization, electing H. C. Blake of Vacaville, president James Corcoran of Vallejo, vice-president; Henry Bird of Suisun, secretary-treasurer. All requirements have now been completed and Solano County is awaiting the appointment of a county farm adviser by the state university.

Central California

Kings County dairymen paid out in cream checks $160,000 for October cream.

Californians are urged to plant seeds of the native poppy now before the winter rains set in.

A squash eight feet long and weighing 131½ pounds was grown by a rancher near Merced.

A pigeon farm containing more than 1000 pairs of birds is being established at Hollister in San Benito County.

The Tulare Cooperative Poultry Association reports transaction of business totaling $4000 for the month of October.

The Oakdale irrigation district of Stanislaus County will try the plan this year of keeping water in the ditches all winter.

The first carload of oranges sent from Porterville under certificate of standard of maturity established by the federal government left that city November 13.

Farmers' institutes were held at Merced November 19, Atwater, the 20th and Livingston the 21st. The hog industry was one of the principal topics discussed.

A carload of sugar cane has arrived in Tulare County. It will be planted as an experiment to determine whether or not it can be successfully grown in that section.

R. M. Roberts, agricultural demonstrator for the Sante Fe, says that rice growing in Fresno, Tulare, Kern and Kings Counties is no longer an experiment but will be profitable.

The Tulare County Protective Association of Porterville has stationed ispectors in the field to guard against the shipping of any fruit which is not in first-class eating condition.

At the next meeting of the Turlock center of the Stanislaus County farm bureau, which will be held December 1, poultry raising will be the subject of discussion. O. H. Roberts is president of the local organization.

One of the most up-to-date packing houses in Central California has just been completed at Lemon Cove by J. E. Pogue, a large grower of oranges, lemons and grapefruit. The packing of navels will begin in a short time.

The newly formed Terra Bella Growers' Association made its first shipment of 50,000 cans of tomatoes to San Francisco last week. The cannery featured an extra fancy pack for which there is considerable demand.

County Horticultural Commissioner Sharp of Hanford, Kings County, is warning vineyardists that they must fight the grapeleaf roller which has recently put in an appearance. He recommends putting sheep into vineyards to eat off foliage and so destroy the pest.

Federal agents will keep close watch of orange shipments this season, and it is thought the government will be particularly severe on all those who attempt to ship out fruit before it meets with tests which chemists have laid down as to maturity.

Southern California

Ontario is holding a pigeon and poultry show this week.

Fallbrook, San Diego County, reports an immense olive crop this year.

Many walnuts have this year been shipped in four-pound sacks, 25 to the "bale."

The Hemet Cured Fruit Association will market its fruit through the state exchange.

Shipping reports show that cotton exports are increasing rapidly, especially to England.

In Los Angeles, November 27 has been named as a special day for everyone to plant gardens for 1915.

The apple harvest of Beaumont, Riverside County, is finished. Eighteen hundred acres will be planted to apples this year.

The walnut crop of the Hemet Valley has been sold to the California Walnut Growers' Association and has netted the growers $12,000.

At the recent meeting of the California Walnut Growers' Association in Los Angeles plans for an extensive advertising campaign were discussed.

It is said the greatest variety of citrus trees to be found anywhere in the world are now growing at the citrus experiment station at Riverside.

The Lima Bean Association has sent a letter to each of its members urging that each one contribute a bag of beans for food for the starving Belgians.

More than $500,000 is realized annually by California vegetable growers for winter vegetables shipped throughout the United States and Canada.

Levee directors have asked for bids for Colorado river control work as the first step in a plan to "straight jacket" the Colorado from the intake to Cibola Valley.

At its recent annual meeting the Anaheim Citrus Fruit Association received a report showing that the association had shipped a total of 318 cars of fruit this season, against 215 last year.

Manager Johnson of the Holly Sugar Company at Huntington Beach announces that his company has enough beet seed in its warehouses today to supply the demand for the 1915 crop.

Experts of the federal forest service and the bureau of soils are surveying the Santa Ana watershed. If the land is considered better for agricultural purposes than for timber it will be thrown open to entry.

The fruit growers of Southern California are expectantly awaiting results of the new process invented by Charles E. Burke, of the University of California's department of chemistry for preserving orange, lemon and lime juice.

Shipments of walnuts from the Los Nietos walnut house will total for the season something over 90 cars. About 65 per cent of the Los Nietos shipments went by way of the Panama canal, the rate being 64 cents per hundred against $1.40 by rail.

The Coast

An ostrich farm is to be established at Chandler, Arizona.

Dairymen of Polk County, Oregon, have organized an association.

The Farmers' Union of Chandler, Arizona, will meet Saturday, November 28.

Washington's Holstein Friesian Association held its annual meeting in North Yakima last week.

Citizens of Murray, Utah, are launching a movement to build a sugar factory in Salt Lake County.

The annual meeting of the Oregon State Horticultural Society will be held at Medford, December 24.

A shipment of Chinese eggs is reported on its way to the Seattle market to sell wholesale at 22 cents a dozen.

The Arizona Egyptian Cotton Company had a unique exhibit at the state fair. It was a cabin constructed of cotton bales.

Five thousand pounds of cottonseed meal was recently sent by parcel post from an Arizona concern to another part of the state.

More than $1,000,000 was paid out in checks last week for sugar beets and salaries of employes by two beet sugar factories near Ogden, Utah.

Three million eggs from the West left New York for England early in November, England's supply from Russia being cut off on account of the war.

The grain crops of Baker County, Oregon, are all threshed and the yield is said to be 50 per cent better than that of last year, with good prices prevailing.

No breeding stock will be shown at the Pacific International Live Stock Exposition to be held in Portland, Oregon, December 7-12. This is because of the outbreak of foot and mouth disease in several states.

The North Pacific Fruit Distributors announce that there is now a better demand for good keeping apples suitable for storage. This demand is coming from all over the United States, from points in Arizona to New York.

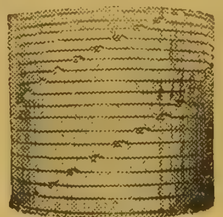
At the recent meeting of the National Woolgrowers' Association in Salt Lake, F. J. Hagenbrath was elected president and S. W. McClure secretary, both of Salt Lake. Salt Lake was made the permanent headquarters of the association.

The North Pacific Fruit Distributors report that apples are going regularly to England, Scotland, Ireland, Denmark, Sweden and Norway, where the markets are little affected by the war. The Russian market which formerly was supplied through Hamburg will of necessity be neglected.

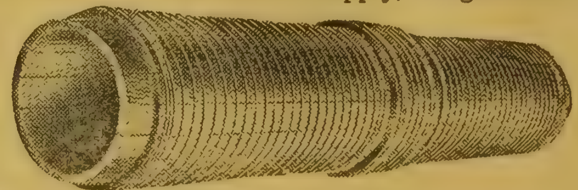
Cash advances of approximately $100,000 have been made already this season to Washington fruit growers of the Spokane district, who sell through the Spokane Fruit Growers' Company. This consists of advances for spraying materials, boxes and other supplies, expenses of packing and shipping and in straight loans to the growers on their fruit.

SILOS
All sizes and dimensions made to order for your particular conditions.
This is a Photo of the 20x40 Redwood Stave Silo Manufactured and erected by us on the Sheldon ranch, Ke‑wood, California.

TANKS
From 500 to 500,000 gallons capacity.



Built to suit All Uses and Users. Cheaper than Metal Tanks, last 10 times as long.
PIPE
Machine Banded or Continuous Stave. For Water Supply, Irrigation or Power.



All Designed by our expert engineers. Made in our own immense factory from clear, air-dried redwood, selected from Air-Dried Stock of 40 Million Feet, which we carry at our plant at ALL times. Write Us for Prices.

STEADY AND QUIET ECONOMICAL OF FUEL
Western Gas Engines consuming special gas oil at 2⅔c per gallon, cost one-third of a cent per HP. per hour to operate.
All our years of engine building experience are concentrated in the new model WESTERN GAS ENGINES. We have left out every unnecessary part. Wearing parts could not be made better. We have built long life and supreme satisfaction to engine users in every WESTERN GAS ENGINE we are turning out. Compare these engines point for point with any on the market, then decide for yourself. We build them every part alike and standardized, on the very finest automatic machinery, with the highest class of skilled labor, under the supervision of master mechanics. WESTERN GAS ENGINES are built in one of the finest equipped factories in the country by master engine builders. The many orders we are now receiving proves that the WESTERN GAS ENGINE is the ideally all-round, all-purpose engine for ranch work.
Before you buy an engine send for our catalogue—free to all who write for a copy.

MAKING CREAMERY BUTTER ON A SMALL RANCH

Written for California Cultivator

By Leroy Anderson

A SUBSCRIBER requests information on the subject of making butter on a 40-acre farm near Los Angeles together with some suggestions as to cost of equipping the farm for dairying. The figures given in response to this request are based on the experience of others—in short I have gleaned some things from "What the other fellow is doing."

The Land

An average cost of fitting land for alfalfa, land that is fairly level to begin with, including leveling, grading, making ditches and checking is about $25 per acre. The cost of a pumping plant to supply 40 acres where the well is about 100 feet deep and the lift about 20 feet is about $1000. If the irrigating well can be located near the building site it may also do for domestic water supply, in which case a tank only would be needed in addition to one well. On a 40-acre farm then the approximate cost of establishing it in alfalfa would be: Leveling, grading, checking, etc., $1000; pumping plant installed, $1000; seed and seeding, $200; total $2200.

Buildings

For a barn I would suggest the one shown in Fig. 1 in the Cultivator of May 14, 1914. This will accommodate 32 cows and four horses. If desired two of the horse stalls may be changed into a bull stall which will obviate the necessity of building an extra bull shed. The cost of this barn is $750, exclusive of the calf shed shown on one side.

The milk house should have at least three rooms—one for separating, one for cream ripening and churning and a third for the engine and boiler. It it probable that a coldroom or ice chest will be needed for the warmer weather since the dairy is too small to afford an ammonia refrigerating plant. In this case a square building 18 to 20 feet on each side and divided into four equal parts, would be the most economical shape to build. There would then be one corner for engine and boiler, one for separator and wash room, one for ripening and churning and the fourth divided into two parts, one for ice-room and one for storage. If this building could be constructed of concrete all the better, especially to save ice in warm weather. Thus built it would probably cost between $400 and $500.

The cost of the necessary dairy building is then: Barn, 56x64 feet,, $750; milk and butter house, $450; Tank house, tank and piping. $300; total $1500.

Livestock—

30 grade cows @ $100	$3000
1 registered bull	250
2 work horses	400
Hogs, 3 sows and 1 boar	100
Total	$3750

Farm Machinery—

1 mower and 1 rake	$100
1 wagon (heavy) and rack	125
1 spring wagon	65
1 set work harness	35
1 12-in. plow	15
2 harrows	50
Small tools	50
Miscellaneous	60
Total	$500

Dairy and Butter-Making Equipment—

1 2-H. P. gasoline or distillate engine	$115
1 2-H. P. vertical boiler	70
1 separator, capacity 1000 lbs. per hour with power attachment	120
1 cream cooler on stand	10
1 50-gallon steam or water jacketed cream vat	35
1 combination churn and butter worker	80
1 galvanized iron wash sink	15
1 baby butter mold and cutter with one extra mold	17
Buckets, can, etc.	38
Shafting, pulleys and installing	50
Total	$550

Summary of Equipment—

Fitting land and seeding	$ 2200
Necessary dairy buildings	1500
Livestock	3750
Farm machinery	500
Dairy equipment	550
Total	$8500

Butter Markets

At present the great majority of California markets are supplied with creamery butter, the amount of ranch and dairy butter made being comparatively small. However, there is some of the latter even in highly specialized creamery localities. I was surprised recently to find in Modesto, ranch butter on sale in the groceries. I do not know where it was made, but it was sold at considerable discount under creamery butter. During the past eight months I have been eating "ranch" butter made by a neighbor and have found it to be of better quality than any creamery butter that we have been able to buy in Santa Clara Valley, some of which came from the interior valley creameries. This ranch butter has cost less than creamery to make.

Butter made well with the equipment listed above should sell as creamery butter because a full creamery outfit is used and likewise creamery methods. It is "ranch" butter when the milk stands in shallow pans from 24 to 36 hours and when skimmed the milk is often sour. Then the cream stands around until a convenient time for churning. (But the ranch butter I have been eating could not have been made that way—it is too good). If creamery butter, it should sell on that basis and thus command the highest prices. In order to make the best profit on such home-made goods in small quantities a special trade must be built up and that, as nearly to the consumer as possible. The wholesaler won't do, because he is two doors from the consumer. Possibly the consumer himself won't do, because it is too expensive to deliver in small lots. Small first-class hotels might like so good a product at remunerative prices. Most of the output could then be delivered at two or three places. Possibly, at the beginning, the best market would be found at one of the smaller groceries which is anxious to build up a fancy trade. At any rate personal investigation would be necessary in finding a market. While re-

Improve the Cows You Have!

Hundreds of "backward" cows that are sold for meat ought to be kept in the herd. Most of the poor milkers are non-productive because their system is run down. They need medicine that will tone up the sluggish organs of digestion and enable them to thrive and perform their natural functions of production and reproduction.

KOW-KURE, the well-known cow medicine has for over twenty years been making good producers out of backward cows. It is a tried and proven remedy for the prevention or treatment of such ills as Abortion, Retained Afterbirth, Barrenness, Milk Fever, Scouring and Lost Appetite.

Try a package of **KOW-KURE** on your poorest milker and note results. It is sold by druggists and feed dealers in 50c and $1.00 packages.

Write us for valuable free book, "The Cow Doctor."

tailers as a whole are supplied by commission men or wholesalers, I believe that a strictly fancy butter, fresh from the churn, would find a good market. One instance comes to mind of a ranch near Redlands that for 25 years has sold its butter to one dealer at five cents per pound above Los Angeles quotations for creamery extras. This butter is made on the ranch from a herd of 100 cows. The butter costs five cents a pound to make, but at that the rancher is ahead of the creamery selling in the open market, because it costs the creameryman two to three cents per pound for making.

Making Butter

I have suggested a power outfit because a herd of 30 cows will warrant it. The two-horsepower gasoline engine is large enough to run the separator and churn, and as distillate can be used for fuel it is cheaply operated. Engine distillate costs six to eight cents a gallon and at that price electric current must be purchased at two and one-half cents per kilowatt hour to compete with the gas engine. Of course an electric motor is easier to operate and requires less floor space.

As to a boiler, the one and one-half horsepower size is about the smallest made and I have listed one of two-horsepower. This furnishes ample steam for cleaning and sterilizing. It can be fitted to burn stove distillate, which is cheaper yet than engine distillate.

Separating and Ripening

Immediately after each milking run the milk through the separator. Let the cream pass from the cream spout directly over the cream cooler into the ripening vat or into a can. The cream then will be cooled to within a few degrees of the temperature of the water inside. In cool weather it will be necessary only to keep the cream in the ripening vat. At night it will cool more evenly than when it comes from the water cooler and by keeping the room closed by day the cream temperature will not rise. In fact in winter it is probable that part of the cream at least need not be run over the cooler. To ripen properly the temperature of the cream should be from 60 degrees to 65 degrees for 12 hours before churning, i. e., if it has been cooler than 60 degrees during the remainder of the time.

To be more concrete, suppose we were churning once in two days, and the next churning day is to be Thursday. Tuesday's morning and evening cream will be run over the cooler into the vat. Wednesday morning, if the cream temperature is below 60 degrees, we will not cool from the separator. That evening, if the cream is not over 60 degrees and is not perceptibly acid we will not cool from the separator. Then next morning the cream should be about right as to acid and temperature for churning. Before separating Thursday morning we put the cream into the churn and have the vat ready for separating. If, on the other hand, the cream in the vat Wednesday morning is above 60 degrees and beginning to ripen, we will cool that morning's cream and we would probably need to cool the evening cream in order to retard the ripening process and not allow the cream to become too sour. These suggestions apply in winter or other cool weather, and probably at such times it will not be necessary to churn oftener than once in three days.

In warm weather the problem is to

"Not the *Cure* But the *Prevention* of Hog Diseases Is Your Big Problem."

Swine epidemics are constantly playing havoc in different parts of the country. Be on your guard.

My message to you is *Prevention*, and almost the whole secret of prevention lies in proper feeding and sanitation. Keep your stock toned up and free from worms—keep the animals, pens, troughs and runs clean and disinfected and you'll have very little trouble raising healthy, weighty stock.

Dr. Hess Dip and Disinfectant
Destroys Germs—Deodorizes—Cures Skin Diseases

These two preparations are the result of my lifetime experience as a doctor of veterinary science, a doctor of medicine and successful stock raiser. Dr. Hess Stock Tonic will put your animals in a thriving condition, make the ailing ones healthy and expel the worms. Contains *tonics* to aid digestion and appetite; *blood builders* to enrich and tone up the blood; *laxatives* for regulating the bowels and *vermifuges* to expel worms.

Sanitation has been my constant message to you for many, many years, through the agricultural press, as being an absolute necessity for the prevention of disease.

Dr. Hess Dip and Disinfectant destroys disease germs, foul odors, and is an effective remedy for parasitic skin diseases. For cleansing hog-pens, stables, barns, outhouses, sinks, drains, troughs, garbage cans, etc. Put it in the hog wallows, sprinkle it around the poultry houses—use it wherever there are foul odors, filth, lice, scab, sheep ticks, mange, etc. It is non-poisonous and non-irritating; always uniform in strength and one gallon makes 75 to 100 gallons of solution.

☛ **So sure am I that Dr. Hess Stock Tonic will put your animals in a thriving condition, make the ailing ones healthy, and expel the worms—that Dr. Hess Dip and Disinfectant will destroy foul odors and disease germs, prevent and cure skin ailments and keep your premises clean and sweet smelling—that I have authorized my dealer in your town to supply you with enough for your stock, and if these preparations do not do as I claim, return the empty packages and my dealer will refund your money.** ☚

The above dependable and scientific preparations are never peddled—sold only by reputable dealers whom you know. I save you peddler's wagon, team and travelling expenses, as these prices prove: Dr. Hess Stock Tonic, West of Rockies, 25-lb. pail, $2.25; 100-lb. sack, $7.00. Smaller packages in proportion. Dr. Hess Dip and Disinfectant is sold in pint bottles, quart and gallon cans, also in barrels.

GILBERT HESS
Doctor of Veterinary Science
Doctor of Medicine

Dr. Hess Poultry Pan-a-ce-a

A splendid poultry tonic that shortens the moulting period. It gives the moulting hen vitality to force out the old quills, grow new feathers and get back on the job laying eggs all winter. It tones up the dormant egg organs and makes hens lay. Also helps chicks grow. Economical to use—a penny's worth is enough for 30 fowl per day. West of Rockies: 1½ lbs. 25c; 3 lbs. 50c; 7 lbs. $1.00; 25-lb. pail $3.00. Guaranteed.

Dr. Hess Instant Louse Killer

Kills lice on poultry and all farm stock. Dust the hens and chicks with it, sprinkle it on the roosts, in the cracks and dust bath. Also destroys bugs on cucumber, squash and melon vines, cabbage worms, etc., slugs on rose bushes, etc. Comes in handy sifting-top cans. West of Rockies: 1 lb. 25c; 3 lbs. 60c. I guarantee it.

I have a book about Dr. Hess Stock Tonic and Dr. Hess Dip and Disinfectant that you may have for the asking.

PACIFIC MANURE & FERTILIZER Co.
429 Davis St. San Francisco

keep the cream cool enough so it will not ripen too fast. Then ice will be essential. Run the cream over the cooler into a can and place the can in the icebox. Leave it there until next separating time, when it is placed into the cream vat. Operating in this way the cream may be held two days before churning even in quite warm weather. While in the vat the cream may be kept cool by running water through the water jacket.

By ripening is meant the development of lactic acid in the cream, this acid being formed by the action of bacteria upon the sugar in milk. The lactic acid bacteria do not work below 50 degrees. They grow slowly between 50 degrees and 60 degrees, more rapidly between 60 degrees and 70 degrees and above 70 they multiply fast. These points help the buttermaker in controlling the rapidity of ripening. Well ripened cream has a smooth glossy appearance and is slightly acid to the taste. Frequent stirrings aid in the evenness of ripening.

The small combined churn and worker, suggested in my list, simplifies both these operations. If the cream is of the proper temperature the churning should require from 20 to 30 minutes. If more than 30 minutes is needed, the chances are that the cream is too cold, if less than 20 it is too warm. When too warm the butter comes soft and is not of good grain when finished. If too cold the butter is so hard as to be difficult to "gather" and thus time is lost.

Washing, Salting, Working

Stop churning when the butter granules are about the size of wheat grains. Then draw off the buttermilk through a seive to catch any butter particles. Add to the butter as much water as there was buttermilk, and at the same temperature. Then revolve the churn slowly eight to twelve times and drain off the water. To remove all the buttermilk wash the butter a second time, somewhat less than the first time and cooler if the butter seems too soft, warmer if too hard. Agitate the churn only slightly this time and let stand ten minutes or so if it is desired to change the temperature of the butter, then drain off well.

Scatter over the butter in the churn an ounce of salt for each pound of butter. Revolve the churn a few times and then let stand for the salt to dissolve, which may be about 15 minutes, then revolve again until the salt is well mixed in, being careful not to work until the butter becomes salvy. The butter when finished should break with a granular texture, something like a broken piece of steel. After working, pack into the mold and set away to cool and harden before cutting and wrapping.

Butter thus made on the ranch, where the milk is separated directly from the cows, should be the best ever and command the very highest price. There are many mouths in the cities asking for just such butter.

It is impossible to induce the cow to give returns before she provides for her own wants. She will use all the food she needs before she will begin to pay for what she gets. What the man who gives his cow a short ration saves in feed represents the feed that would be used by the good cow in making returns.

The silo insures the continuance of pasture conditions and profitable dairying throughout the winter.

NO BREEDING CLASSES AT PACIFIC INTERNATIONAL EXPOSITION

The Pacific International Livestock Exposition, to be held at Union stockyards, North Portland, Oregon, will show only fat stock. Manager O. M. Plummer writes:

"As the result of a conference between federal officials of the bureau of animal industry and prominent breeders and offcers of the livestock exposition, it was decided to call off that part of our show given over to the breeding classes in cattle, hogs and sheep, giving this year a strictly fat stock show, covering livestock intended for slaughter.

"It was the consensus of opinion that there was a minimum only of danger in connection with the foot and mouth disease, but with such an investment as would be represented by the many herds of pure-bred livestock from all over the western part of the United States which had already been entered, it would be unwise to continue the breed end of the show. This will in no wise affect the classes in the fat stock division given over to fat cattle, hogs and sheep.

"The managers of the auction sale of Shorthorns, Herefords, Holsteins and of hogs, also state that their sales will be carried on as advertised, as their offerings are all owned in local territory.

"The student judging contest in which at least six of the agricultural colleges of the Pacific slope are entered will be held as usual.

"Indications at the present time point to the largest showing of fat stock ever held on the west coast, and parties of livestock men and others interested in the industry are being made up at all the larger cities and towns in contemplation of spending the week of December 7-12 at the Live Stock Show in Portland."

A great deal of the sow's future usefulness depends upon how she is cared for and fed until bred for her first litter.

Don't Be Tied To A Cow's Tail—

Hired man a poor milker—he quits or goes off on a spree—all hands drafted in—hours lost morning and night—teams idle—"got to get back for milking." Just as if there aren't 250,000 cows milked twice a day with

The Hinman Milker

—a success for over 6 years, that enables a boy to milk 25 cows an hour, get more milk and cleaner milk. The *Hinman* will save you enough to pay for itself the first year—then 100% to 200% interest. Let's prove it this week. You will have a *Hinman* some day anyhow.

Hinman advantages: one cow milked at a time; no vacuum in pail; rapid pail changing idea, no piping—just a simple drive rod; only two moving parts, visible milk flow; simple method of keeping record.

May we write you the name of your nearest *Hinman* owner neighbor and send you a booklet? A postal will do.

Hinman Milking Machine Co.

ONEIDA, N Y

Purebred Registered

HOLSTEIN CATTLE

In Holland the average yield of milk per cow is 10,000 pounds; in this country it is under 4,000 pounds. That's why dairying is more profitable there than anywhere else in the world, despite the high cost of land and feed and the fact that prices received for dairying products are no greater than in America.

The Hollanders depend upon the Holstein-Friesian cow. Does the experience of this nation of dairymen mean anything to you? Get more reasons why you should use pure-bred registered Holsteins.

Veterinary Queries

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Catarrh

Horse has discharge from nose. Only troubled since wet weather. Trouble more apparent when she trots. Is it a cold or distemper and what is the treatment?—Subscriber, Imperial.

Catarrh or cold in the head often follows getting wet. Get eight ounces of nitrate of potash and six ounces of chlorate of potash. Mix and give a tablespoon in the drinking water two or three times a day. Keep the horse in a warm place at night and do not drive too fast. Overdriving a horse in this condition may cause broken wind.

Worms

A mule seven years old has cough but no sign of distemper. Stays in poor condition. Has ravenous appetite and never seems to get enough to eat. His coat is rough. He is idle most of the time and is fed good oat hay and alfalfa. What is best for him?—Subscriber.

Probably he has worms. Get the following powders of your druggist: Ground gentian four ounces, ground nux vomica two ounces, sulphate of iron three ounces and enough farina to make one pound. Give a tablespoon once a day. If you can get good wood ashes mix a pint of it with two quarts of salt and give a tablespoon of that also once a day.

Wire Cut

About three months ago my young horse got a wire cut between the hoof and the lower joint of the leg. I used sheep dip and peroxide and it is healed very well. She is almost well but limps just enough to be noticeable. She also has a small swelling between the lower joint and the knee something like a splint. Do not know whether she limps from this swelling or the cut. What is best to do for it?—Subscriber, Santa Maria.

The lameness may come either from the splint or the wire cut. Rub the splint hard with a round stick and grease it once a day with a liniment made of equal parts of turpentine and bacon grease. Use the same liniment on the wire cut to keep it soft and have the foot cut even the same as you would to have it shod so he will walk straight on it. A hoof that is longer on one side than the other often causes lameness that may result in ringbone.

Sick Colt

I have a colt 19 months old that I had castrated about a month ago. He is healed up but his right side bloats and he seems to be stiff in his hips at times. Had a veterinary see him and he said it was impaction of the bowels. Gave him three doses of raw linseed oil, a pint and a half at each dose. It loosened the bowels a little but not enough. When he drinks much water he breathes fast. When he urinates it seems to hurt him. Could it be some trouble with the kidneys that causes the bloat on his side? Please advise me what to do.—Subscriber, Coalinga.

It is hard to diagnose this case without seeing the colt. It may be that he had a fall and hurt something inside or an abscess may be gathering inside from distemper. Probably the best thing you can do for him is to continue the oil but be sure the oil is the raw linseed and not the boiled that is used for paint. Add an ounce of turpentine to each pint of the oil. Also give him a teaspoon of saltpetre twice a day for a week.

Rheumatism

I have a young cow that will be fresh in January. I think she has rheumatism and want some advice regarding her. She is kept in an alfalfa pasture on low land. It gets cold there at night and there is always moisture on the grass in the morning until late. She has trouble in walking and seems to throw her legs out of joint at times so she can hardly bear her weight on them, sometimes one leg and then another. At present I am keeping her in a corral near the barn where it is high and dry. Should I keep her there or does it make any difference? Is it serious and is there any medicine that I should give her?—Subscriber, Orosi.

By all means keep her in the dryest place you have until the dew is off the grass and put a blanket on her at night. It is rheumatism and the following powders will probably relieve her. Acetate of potash eight ounces, bicarbonate of soda four ounces and salicylate of soda four ounces. Mix and divide into 32 powders and give one powder morning and evening.

Garget

About a year ago several of our cows had garget and about six weeks ago several of them took it again. The first time they had it we were told it was carried from one cow to another by the milkers, so this time from the start we washed the udder and hands in germ killer after milking each cow. Still six cows took it. We used the sterilized air treatment and gave them a garget remedy, but one cow went dry in one quarter. Is there anything to keep them from taking it again? Please explain how to prepare and use the iodide of potash solution spoken of in the Cultivator of Sept. 3d? What to use to inject it and how much to inject at a time?—Subscriber, Tulare.

Garget, being brought on by several different causes, is hard to guard against but once it is present use plenty of antiseptics and clean up the stable. A coat of whitewash is a great cleanser. The iodide of potash solution mentioned is the same as was used for milk-fever before the air treatment was discovered. First clean a quart bottle by filling and rolling it in boiling water. Dry it in a hot oven. Then put two drams of iodide of potash and three or four drops of carbolic acid in it and fill with boiling water. Cork tight and allow to cool to body temperature. Pump one-fourth of the solution into each teat. Use a household syringe (one with the bulb in the middle), replacing the ordinary nozzle with a milk tube. Be sure to sterilize the syringe before using it. The solution should be milked out in half an hour.

Rheumatism

I have a well cared for cow which has rheumatism in her front leg. What do you suggest to give her for it?—Subscriber, Riverside.

Give her the following powders: Acetate of potash eight ounces, bicarbonate of soda four ounces and salicylate of soda four ounces. Divide into 32 powders and give one morning and evening.

Quittor

Have a heavy horse with a split hoof (as per sketch inclosed). Have bathed, greased and done everything I know, but it does not get well. It seems that the hoof is decaying and is full of pus. It also swells above the hoof.—Subscriber, Creston.

An abscess in the foot is called quittor. It may have been caused by an ill fitting shoe. The wall and sole around the opening where the pus escapes should be entirely cut away and the abscess syringed to the bottom of the cavity where the pus comes from with a solution of bichloride of mercury, one part to 500 parts of water. You can get the tablets at the drug store and use two to the pint of water. Warm the solution before using it. If a veterinarian is in reach you had better get him to treat it for you. Have him blister it above the hoof which will hasten the repair.

THE INIMITABLE YOUNGSTER

"What are you doing, Tommy?" teacher inquired in her sweet manner.

"Drawin'," was the sullen response.

"Drawing what, Tommy?"

"Drawin 'a picture of God."

"But, Tommy," said the teacher, "nobody has ever seen God. Nobody knows what He looks like."

Tommy was undaunted. "Well, they will when I get this picture drawed."

SALE OF DRAFT HORSES

The California Draft Horse Breeders' Association is taking steps to determine whether or not it would be feasible or advisable to attempt to hold a public sale of breeding-draft horses. The idea is, if possible, to establish a custom of holding an annual sale, so that breeders may count definitely on this event as a suitable time for disposing of their surplus breeding stock. If the sale can be held this year, it will probably be carried on at the university farm at Davis sometime during the latter part of January or the first part of February. The entire management of the sale would be in the hands of the association. Only sound, registered horses would be accepted for sale, but it is not necessary that you be a member of the association in order to send consignments. The board of directors is now busy attempting to find out who wish to make consignments to such a sale, and they will be glad to hear from anyone that is interested.

A large shipment of New Zealand butter is expected to arrive soon in the port of Seattle.

The Care and Feeding of Crops

For Your Own Good

Here are a few facts which will help you to grow better crops — and make a better profit:

"Poor growth, yellowish or light green foliage, and a general lack of vigor in plant or tree indicate need of Nitrogen. Yellowing of the leaves, due to chlorosis, must not be mistaken for Nitrogen hunger."

"Slow maturity, poor formation of grain, seed or fruit and brittle wood growth indicate need of Phosphoric Acid."

"Sour fruit of poor quality, poor yields of root crops or brownish spots and discolorations of foliage indicate need of Potash."

Our service department will gladly answer any letters by mail. Our experts tell you the needs of the different crops under varying conditions.

Poultry for Profit

THE THANKSGIVING TURKEY

Written for California Cultivator

By Jean A. Koethen

WE are accustomed to think of the turkey as having been discovered by the pilgrim fathers when they landed on the "stern and rock-bound coast" of Massachusetts in 1620, and it is rather a disappointment to learn that the bird, although a native of America, was well known in Europe more than 50 years before the Pilgrims turned their backs on England. The earliest known description of it is in an old Spanish book supposed to have been written in 1527, which speaks of the turkey as already having been taken from New Spain (Mexico) to the Islands of Castillo del Oro, where they had been tamed and bred in a domesticated state. These North American birds were well known all over Europe before the seventeenth century and seem to have been then as now a favorite dish at celebrations.

The American wild turkey was quite well distributed over the whole country, being found by the early settlers from the Atlantic to the Pacific and from the Great Lakes to the southern boundary of Mexico. The variety found in Mexico differed from that of the north, in that it had a band of creamy white or silver grey across the tips of the tail feathers and of many of the body feathers, while in the north this band was chestnut or chestnut brown. Undoubtedly our Mammoth Bronze turkey, the finest of the race, is the descendant of these Mexican birds, though there have been many out-crosses. The wild turkey is gradually disappearing but there are still enough left in the mountain fastnesses to furnish a little wild blood as a tonic for the ills of inbreeding, and this wild blood is much sought after. In time there will be no more, and then the turkey must either adapt itself to domestication, as the domestic hen has done, or degenerate as it does wherever it is inbred for years.

The Turkey a Wild Bird

When we consider that it is only a matter of 400 years since all turkeys were wild and that the domestication of our American birds dates back for the most part a much shorter time than that, while the hen has been bred in domestication at least 2000 years, it is easy to realize what a large part this inherent wildness plays in its rearing. Turkeys after they pass babyhood need no shelter, save perhaps in the heaviest rainstorms, nor can they be fed as chickens are fed without regard for exercise. With the turkey exercise and feeding go hand in hand. Watch them as they stroll out in the morning, nibbling and picking as they walk, here a bug, there a fly and again a weed, seed or a bit of gravel. This is their natural way of feeding, and he who would rear them successfully must imitate nature as closely as may be. Trying to raise turkeys in close confinement is going "ag'in nature" and is rarely successful.

Varieties

Seven varieties of turkeys are recognized by the American Standard of Perfection: The Bronze, Narragansett, White, Black, Buff, Slate and Bourbon Red. Of these the Bronze is the largest, with the Narragansett and Bourbon Red second, the standard weight for the adult Bronze cock being 36 pounds and for the other two, 30 pounds. The other four varieties are considerably smaller, the standard for the White Holland cock being 28 pounds and for the others, 27 pounds. A Bronze hen of standard size weighs 20 pounds; those of all the other breeds weigh 18 pounds.

The Narragansett turkey was developed in Connecticut and Rhode Island and gave those states a most enviable reputation for producing fine market birds until blackhead came and ruined the industry in New England. It is a bird with a very large development of breast and is popular throughout the east. Neither the Narragansett, the Buff or the Slate is raised on the Pacific Coast. The Bronze leads in popularity here as elsewhere in the United States; there are many fine flocks of White Hollands and Bourbon Reds and a few flocks of Black turkeys.

The Mammoth Bronze

Doubtless the Lord could have made a more beautiful bird than the Mammoth Bronze turkey, but doubtless He never did. With its brilliant blue-red head, the sheen of its plumage, showing now a coppery bronze, now green, now blue, now black, as the light changes, its lordly carriage and magnificent size, it is a bird to be proud of if you own it, and to covet if you do not. Chief among its admirable qualities, and doubtless characteristic of all turkeys, is its gentle, friendly disposition. You can make friends of chickens if you try. You make friends of turkeys without trying. The hand that feeds them is the one hand in all the world to them. Strangers excite suspicion, as is shown by the animated gobbling with which they are greeted, and the appearance of a red sweater awakens wrath and indignation, but they always run to meet "mother," or roost on the doorstep to await her coming, or come hurrying home at the sound of her voice. My turkey toms remind me of nothing so much as a lot of mischievous boys, a little rough sometimes, but always human underneath.

The Bronze turkey is hard to raise, but very hardy once it is raised. It has a reputation for wandering and another for staying at home. My Bronze turkeys never wander, but I think this it because they are raised by chicken hens. Probably young turkeys will wander with a turkey mother as readily as they stay at home with a hen mother. Where young stock are expected to pick up their living over a large range it is best to raise them with turkey mothers.

The Bourbon Red

The Bourbon Red turkey is increasing in popularity everywhere, though it is so new a breed that it was admitted to the Standard but four years ago. The color is a dark or brownish red, with white in the wings; tail tips of some of the feathers bluish bronze, and an undercolor that is almost white, although many breeders prefer buff. Its origin is not known, but it seems to have developed in Kentucky and southern Ohio. It is probably no hardier or better in any respect than the Bronze, unless the smaller size of the tom be an advantage. Undoubtedly there is more demand for market birds weighing less than 20 pounds than for larger ones, but the Bronze turkey hatches in May, reaches a good, marketable size of from 15 to 20 pounds by Thanksgiving, and this is a size which suits most families very well and puts a little greater profit in the pocket of the producer than a smaller bird might.

The White Holland

Next to the Bronze, the White Holland is most popular. It is thought that it originated in a sport form the Bronze, though there is a tradition that the first birds were brought to this country by the early Dutch settlers, hence the name. The White Holland has been much advertised as "the stay-at-home turkey," but how it could stay at home more closely than the Bronze does when raised by a domestic hen is hard to see. Its small size and freedom from dark-colored pin feathers make it a very satisfactory market bird, and its snowy white plumage and red head make it almost too showy when hawks are about and the bird is young and small.

Belongs On the Farm

The ideal place for raising turkeys is on a large grain or alfalfa ranch where the birds can roam at will and pick up their living as they go. Where all their food must be bought they are not very profitable, for they are very large eaters and there is always danger of overfeeding them. Where they have suitable range they are very profitable, as many a farmer and farmer's wife has found. On the large ranches of Imperial Valley, San Jacinto and the desert country and the grain farms of the San Joaquin Valley thousands of birds are raised every year for marketing in Los Angeles and San Francisco at Thanksgiving and Christmas. If they are properly bred and reared there is no reason why they should not mean immense profit to every farmer for the demand is almost unlimited in spite of the high prices.

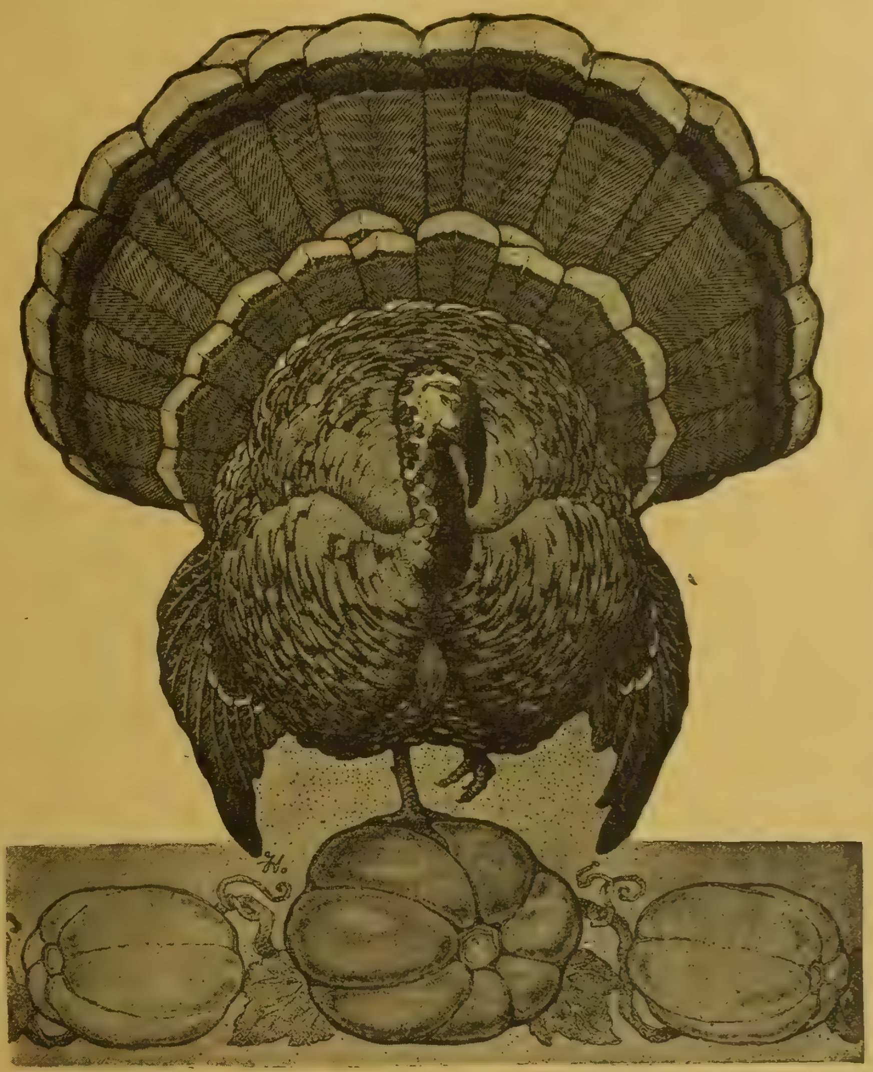
Breeding Turkeys

Much depends on the character of the birds chosen as breeders. It is not wise to breed from hens under two years of age. Pullet's eggs often hatch well, but the young birds are smaller and lack the stamina of those hatched from mature mothers. A young tom mated to two or three year old hens usually gives the best results.

In choosing breeders select the large, early hatched birds. Many farmers tempted by the high prices paid just before Thanksgiving let their largest birds go and keep the smaller ones for breeders. Late hatched birds are rarely good breeders.

Select a tom that is near standard size if you want to keep up the size of your flock. Standard weight for a Bronze yearling cock is 33 pounds, and for a cockerel, 25 pounds. The Standard gives no weights for White Hollands and Bourbon Reds, but the cockerel should weigh 20 pounds. I suppose the term cockerel here means a bird of the right age to mate, which is about ten months. My Bronze cockerels this fall weighed 15 pounds when they were a little past five months of age, so they should easily reach standard weight in another five months. The male bird chosen to head the flock should also be well marked and very vigorous. A young bird of large frame, though thin, makes a larger adult than a fat bird of smaller frame.

It is particularly important that the breeding birds be unrelated. Some authorities say constant inbreeding is the cause of the prevalence of blackhead and the consequent destruction of the industry in many parts of the east. Inbreeding weakens the vitality of the stock and makes it a prey to disease. Expert breeders never mate turkeys that are in the slightest degree related. It costs money of course to buy a new tom or new hens every year, but it must be done if turkey raising is to be successful. Mating brother to sister or daughter to sire is entirely wrong and means only disaster. One male bird is sufficient for seven or eight females and in some cases for twice as many, but it is safer to purchase another tom if the number of hens is over eight or ten.



THE RABBIT INDUSTRY

Written for the California Cultivator
By R. V. Moore

As meats increase in value the attention of the public is called to the problem of finding a substitute. Rabbits are near the head of the list. This is due to the fact that they can be raised so cheaply in comparison with poultry and other fowls and animals. They make quick growth, have nice flavored white meat and, last but not least, have remarkable breeding qualities under all kinds of conditions. Furthermore, they require little attention and are not subject to disease where kept under reasonably clean conditions. Their chief enemy is hot weather.

The three best known breeds today before the public for culinary purposes are: Flemish Giants, Belgian hares, and last but best for dressing for market, New Zealand hares. The last named, as they become better known, are rapidly coming into popular favor as the ideal rabbit for the market, for anyone who has dressed them for the table and stripped them of their beautiful red or reddish tan fur can appreciate their good qualities over the other breeds. The Flemish Giants, the largest of domestic rabbits, as well as bringing the highest prices when exhibition rabbits are taken into consideration, have the fault of not breeding true to color; a breeder hardly knows what color to expect in a litter of youngsters. Some are jet black, others light and steel grey, and those which are known as silver-tips have a coat of black with white hairs scattered promiscuously. The steel greys are the most valuable. The Belgian hare, known everywhere, needs little comment from the writer, and like the New Zealand hare, has more at a litter than the Flemish Giants. If the litters are too large many breeders reduce down to four or five in a litter, for with this number the young will mature much more rapidly and be more hardy.

The winter months find a greater demand for rabbits than the summer, as many people refuse to eat them during the summer time under the mistaken idea that they are diseased like so many of the wild jack rabbits and hares of the plains. In fact, in Los Angeles during the past four months up to September 15 I have had hundreds of rabbits offered me as low as eight cents a pound, but these prices will not continue from now on during the winter months, for as the tourists arrive the hotels and cafeterias will take more of the rabbits. In Los Angeles, where one has to buy alfalfa hay by the bale for his rabbitry, I have often heard it said by those qualified to speak on the subject that rabbit meat cannot be produced under 12½c per pound. Alfalfa hay, together with bran and crushed barley, usually comprise their staple food supply with a bountiful supply of clean fresh water before them at all times.

When rabbits are better known among the general public, like squabs, they will be used far more extensively.

MOLTING TIME
is apt to be a time of trouble with your hens.

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Accounts Outlawing

Do open accounts, such as general merchandise bills, outlaw in two or four years?—Subscriber, Dinuba.

Open book accounts outlaw within two years from date of last purchase or acknowledgement in writing of the indebtedness. If it was in the nature of a mutual account, such as is the case with some farmers turning in produce and receiving credit and obtaining merchandise, it would not outlaw until four years after the date of last transaction.

Accident on Bridge

In case a team goes about 200 feet on a long narrow bridge on the county highway and there is no other vehicle, person or conveyance of any kind on said bridge at the time, then an automobile coming from the opposite direction reaches the other approach some 600 feet ahead of team, has the automobile the right to enter on and continue to cross said bridge, which is hardly wide enough for two gentle teams to pass? And if auto does continue on its course and frightens team, causing damage to the rig or occupants, is the owner of automobile liable for damages?—Subscriber.

The facts which you have stated are not sufficient in themselves to constitute any cause of action against the driver of the automobile, as he had as much right upon the county bridge as you had. There are undoubtedly circumstances, however, in addition to those which you have stated which might show his liability.

Birds Destroying Crops

Does not the farmer have right to shoot any game birds which may be destroying his crops, and at any period of the year?—Subscriber, Modesto.

The act providing for issuance of hunting licenses expressly excepts predatory birds or animals. Section 637-A of the Penal Code expressly provides that nothing in that section prohibits killing of non-game birds found destroying crops growing upon the premises of the farmer.

Straying Animals

When a person puts up loose stock, hogs for instance, depredating on his premises and destroying his crops, and duly notifies the owner according to law, how long must he hold and feed such animals before he can dispose of them for damages and cost of feeding, providing the owner does not come near and settle up and secure release of his animals, and how must one proceed to dispose of said stock to get damages?—Subscriber, Greenfield.

When you know the owner of the straying animals you may within five days after said animals were taken up notify him, for which notice you are entitled to the sum of 50 cents. This notice should thereupon be recorded in the office of the county recorder. It should contain a description of the animals, together with the probable value and statement of the place where found and where the taker-up has confined said animal. Thereafter within 30 days from the recording of said notice, the owner of the animal may reclaim same upon paying to the taker-up the costs of recording notice and of giving said notice, which includes, in case the owner is not known, the costs of publication of said notice for two weeks in some newspaper published in the county where the straying animal is found, providing said cost of publication does not exceed $3.00, also the sum of 30 cents a day for the keeping and care of each horse, mule, jennie, ass, cow, bull, ox, steer or calf, and the sum of 10 cents per day for the keeping and care of each sheep, goat, hog or other animal not specified. If no owner appears within 30 days, the taker-up should notify the constable, which notice should specify that he has complied with the provisions of the act, that the owner has failed to appear or has failed to pay the costs. The constable shall thereupon immediately proceed to sell the animal at public sale, and out of the money realized therefrom will retain his own fees for the sale, then pay the taker-up his costs, and the surplus, if any, he will pay to the county treasurer.

Procedure in Lawsuit

In case demurrer is overruled, in what length of time must defendant answer? If defendant does not answer, what are then the rights of plaintiff?—Subscriber, Lemon Cove.

Usually, unless the court otherwise orders, defendant has ten days after the overruling of the demurrer within which to answer. Within ten days after notice to him of the ruling of the court and failure to respond upon the part of the defendant, default and judgment may be taken against the defendant the same as if he had not answered the complaint. Demurrers raise a question of law upon the complaint and they are usually brought up for argument on some special day of each week while court is in session.

Income Tax

Suppose I have an income this a year of $8000 and am in debt to the full amount. If I pay my debts must I borrow money to pay my income tax?—Subscriber, Corcoran.

Payment of debts is an offset against income, and it is only the net income after payment of debts and losses, that is taxed. Thus with your income of $8000 and payment of debts to the full amount of $8000 or paid debts to the amount of $4000, if you are a married man, you have no income tax to pay.

Final Settlement of Estate

How long after the administrator is appointed must there be final settlement of an estate?—Subscriber, Greenleaf.

There is no time limit within which an estate must be settled, it depends entirely upon the conditions of the estate itself.

Hunting on Unfenced Property

Has one the right to hunt on uncultivated, unfenced private property, there being no trespass notices posted?—Subscriber, Coalinga.

Every person, who without permission of the owner, enters upon enclosed or cultivated grounds, which are private property and where signs are displayed, not less than three to the mile, for the purpose of hunting, is guilty of misdemeanor. Thus in the above stated facts there would be no penal liability, but you might be held responsible in civil action for nominal damages.

To Quiet Title

A and B own adjoining property. It is quite desirable that A have B's property, but for several years nothing has been heard of B and all efforts too locate him have failed. What steps are necessary for A to take to come into possession of B's property, A having paid taxes on same for six years?—Subscriber.

If you have enclosed the property of B by substantial enclosure and usually cultivated the same for a continuous period of five years or more and paid all taxes levied or assessed upon the same, you may bring an action in the superior court to quiet your title to this property under ground of adverse possession.

NAPA COUNTY FARM BUREAU

Farm Adviser H. J. Baade of Napa County writes: "The members of the Napa County farm bureau have succeeded in getting the Napa River cleared of all obstructions so that during the coming season the water will be able to run off better and not flood the rich farms of the valley. Every farmer having land on the river agreed to cut out any rubbish, trees and debris.

"The farm bureau called a meeting of all the farmers interested in dairying at the Napa Chamber of Commerce, November 21, for the purpose of organizing a cow testing association. Already 800 cows have been pledged for the association and the success of this undertaking is assured.

"The members of the farm centers have ordered three carloads of air slacked lime for their soils. In all, Napa County this season used nine carloads of lime on the soil."

TELLING YOUR AGE

I know you won't believe me when I tell you that I'm only eighteen, but really when I was nine years old people used to take me for twenty. I was always mature and sensible, and I've always thought a whole lot and, thought is bound to leave its mark on you. Why, my father had gray hair when he was sixteen, but that doesn't mean anything. I have a friend who's only fourteen and yet everybody takes him for a man of sixty. You can't always judge by appearances because I have another friend who's thirty-eight and has a family and yet he looks so young people take him for his own son. I know you think I'm not telling the truth, but why people should lie about their age is more than I know.—New York Sun.

"This war can't last forever," the cotton growers are assured. But, unhappily, neither can the cotton growers.

A Tip on Almonds

On this continent Almonds are grown only in California. The American market alone demands *four times* the present supply.

With practically an unlimited home market and a monopoly of the product

Plant Almond Trees if you are seeking a real money-making investment.

We have an extra fine lot of trees growing on Bitter Almonds, Peach, and Myrobolan Root, but as there is usually a shortage of trees on Bitter Almond, place your contract immediately—don't delay.

Glenview Poland China—Stock for sale Chas. R. Hanna, R. F. D. No. 3, Riverside, Cal.

For Sale—Young registered Berkshire boars and sows, fine strong stock. Stanislaus Ranch Co., Crows Landing, Cal.

M. H. Locke Co., Lockeford, Cal.—Choice young Jersey bulls for sale.

MACHINERY

FOR SALE—SECOND-HAND WINDMILLS, TANKS, PUMPS, ENGINES, RANCH MACHINERY

Some new at real sacrifice, till January 1st, to clean up. New Galvanized tanks, save 30 per cent and freight, 1000-gallons, $19.50; 2000, $29.50. Engines, 25 per cent of first price. 18 H. P. engine pump, 50,000 gallons, tank cost $1800, all for $400; sell part; 3 H. P., $50; new 4, $58; 5, $95; 12 horse, $125. Holt steam tractor combined harvester, 24 disc cultivator on cars, $790. Cost $6000. Trade for auto, real estate, what? Our material absolutely best serviceable material can be produced for. Pioneers in our line. Call, write Demmitt Company, office 120 N. Main street, 15191, Broadway 1984.

Distillate and Oil Engines—Pumping machinery of every description, spraying outfits, pulleys, belting, etc. We also have some used engines and pumps which have been put in first-class condition, which we can sell at a great reduction. The money saving Lawter Tractor is specially designed for heavy field subsoil plowing at one-half the expense with horses. Write for literature. Wm. Gregory, 602 N. Main street, Los Angeles, Cal.

Gas engines, centrifugal and deep well pumps, motors, and everything pertaining to irrigation, for sale and exchange. If you want a complete plant or any part write us; we are experts in irrigation; advice and estimates cheerfully given. Will buy, sell or exchange. Reliable and responsible, everything guaranteed as represented. Machinery & Motor Exchange, Inc., 738-735 San Fernando St., Los Angeles. Main 6882. F-3433.

For Sale—Used and new gas engine, 2 H.P. up, rebuilt and fitted with modern equipment. 22 years' experience enables us to repair and rebuild gas engines correctly. Get our prices. Lloyd, 306 N. Main, Los Angeles.

SEEDS AND PLANTS

$70 and $50 for Orders Placed Now with cash for present or future delivery. Luther Burbank $70 per 1000 slabs. Mediterranean $50 for 1000 slabs. Luther Burbank and Mediterranean Spineless Cactus Plantations, San Dimas, Cal., R. F. D. 35-A. Agents wanted.

Seed Barley—We grow it on our own ranch, reclean it in our own mill, and sell it in our own store. Write for price and sample, stating quantity wanted. West Coast Seed House, 116-118 E. 7th St., Los Angeles, Cal.

Strawberry Plants—Gold Dollar, Early Ozark, Gold Mine, St. Louis Missionary. Fine plants, pure stock, prolific bearers. Large red berries, $2.50 per 1000. Himalaya Blackberry plants $3.00 per 100. W. E. Hixon, Arroyo Grande, Cal.

Strawberry Plants — Gold Dollar, Clark Seedlings, Magoons, Wm. Belt, Marshalls, Goodells, Early Ozark, and new Oregons, $2.50 per thousand. Thoroughbred plants. Mr. John Christiansen, R. F. D. 2, Canby, Oregon.

SPINELESS CACTUS

The very best Burbank spineless Cactus at reduced price. By mail, postpaid, 20c each. By the hundred, 15c. J. H. Young, Box 113, R. R. No. 1, Anaheim, Cal.

Berry Plants, Rhubarb, Cacti—It will be worth your while to send me a postal right now if you are interested. Louis F. Scribner, R. 2, Pasadena, Cal.

Strawberry Plants — Magoon, Marshall, New Oregon, Hood River or Clark's Seedling, Klondykes, etc., $2.50 per 1000. Fine plants, well packed. J. W. Vinacke, Canby, Oregon.

For Sale—Alfalfa seed free from bad seeds, fine quality, at 14c lb. Inquire of H. S. Garrison, Murietta, Cal.

Thornless Cactus Slabs for sale at 5 to 11 cents each. Chas. R. Hanna, R. D No 3, Riverside, Cal.

DUCKS

Ducks—High class Mammoth Imperial Pekin Ducks, and Indian Runners for breeders. Also eggs. The best stock in California. Stone Canyon Poultry Farm P. O. Box 348, Sawtelle, Cal. Sunset Phone 565-M Santa Monica Exchange.

Developing, 10c per roll; Printing, 2¼x4¼, 3c; 3¼x5½, 4c; Post Cards, 4c Denver Store 706 So. Hill St., L. A.

MISCELLANEOUS

Free for Six Months—My special offer to introduce my magazine "INVESTING FOR PROFIT." It is worth $10 a copy to anyone who has been getting poorer while the rich, richer. It demonstrates the REAL earning power of money, and shows how anyone, no matter how poor, CAN acquire riches. INVESTING FOR PROFIT is the only progressive financial journal published. It shows how $100 grows to $2200. Write NOW and I'll send it six months free. H. L. Barber, 430, 2 W. Jackson Blvd., Chicago.

Dynamite—For practical uses of dynamite; as in tree planting, subsoiling, removing stumps and boulders, drainage, etc. Also for blasting supplies. See B. K. Deal, 1520 W. 45th St., Los Angeles, Cal.

To Lease—My 160 acres in Niland, Imperial Valley, forty acres under irrigation canal. One mile from Southern Pacific depot. Owner, R. K. Holahan, 28 Carroll avenue, Venice, Cal.

Ranchers—We can handle your honey, beans, nuts, dried fruits, etc., at good prices. Send full information. Producers to Consumers Supply Co., Room 306, 230½ S. Spring St., Los Angeles, Cal.

"Smith's Pay the Freight"—To reduce the high cost of living, send for our Wholesale to Consumer Catalogue. Smith's Cash Store, 112 Clay St., San Francisco.

TURKEYS

For Sale—Mammoth White Holland Turkeys. Mature hens and toms. ALSO young stock from five distinct pens, headed by toms from yards of leading breeders of this breed in the state. EGGS IN SEASON. Orders given prompt attention. Prices on application. Address H. McKusick, Box 733, Calexico, Imperial Co., Cal.

Sharp's White Holland Turkeys made a clean sweep at California State Fair, including sweepstake. And also at Fresno County Fair. ALSO snow white Leghorns, stock for sale. Henry Sharp, R. 2, Box 70, Selma, Fresno Co., Cal.

Thoroughbred Mammoth Bronze Turkeys —Fine early stock. Also flock of 10 finely marked turkey hens from one to five years old and weight from 16 to 21 pounds. Price, $50. Mrs. Nellie Hart, Holtville, Cal.

Mammoth Bronze Turkeys—Strong, vigorous, well marked toms and hens from the best blood of prize winning and utility stock. Prices reasonable. Geo. A. Smith, Corcoran, Cal.

Thoroughbred Bourbon Red Turkeys. Fine large yearling toms $10. Toms last April hatch $7.50. Hens $5. W. S. Bernard, Anderson, Cal.

Thoroughbred Bourbon Red Turkeys— Hardy breed, reared in high altitude. C. P. Guthrie, San Jacinto, Cal.

WANTED

Man Wanted—To a man furnishing a bunch of cows to establish a dairy on my 70-acre alfalfa ranch in the Pomona Valley, I will sell a part or half interest at $350 per acre and let him take charge of the place on cash or share basis. Herbert F. Clark, 31 N. Granada, Alhambra, Cal.

Wanted—Position by single man as working foreman for orange or lemon grove. Expert in budding and pruning. 22 years experience. References furnished. Address, Box W, Cultivator Office, Los Angeles, Cal.

Farms Wanted—We have direct buyers. Don't pay commissions. Write describing property, naming lowest price. We help buyers locate desirable property Free. American Investment Association, 12 Palace Bldg., Minneapolis, Minn.

RABBITS

For Sale—New Zealand Rabbits. "The best meat producers." A grand bunch of fine, red, half-grown youngsters. 1 buck and 3 does for $5.00. Also mature stock. Your chance to secure a start of this splendid strain at small cost. Shipped anywhere. Standard Rabbitry, Santa Ana, Cal.

New Zealand Reds—Scored and sold on merit. Investigate. Our Catalogue is free. Caldwell Bros., Los Angeles, Cal., Box 613

For Sale—New Zealand Reds, fine breeding stock. Also Barred Rock eggs for hatching. Mrs. C. A. Richey, R. D. 8, Box 557, Los Angeles.

BEES

Beekeeping Pays Big—Price list, bees, instruction books, etc., free. Spencer Apiaries Co., Box 14, Nordhoff, Cal.

FIELD SPORTS

When you keep a boy interested in football, baseball, tennis, and the like, you lessen the chances that he will get interested in things not so good for him.

The Youth's Companion, since its enlargement, gives generous space to this matter of athletic training.

How to practice to become a first-rate pitcher, how to train for a race, how to learn the newest strokes in swimming—these and a hundred other topics of the greatest interest to boys—to girls, too, for that matter—are touched upon.

And this is only a small part of the service which The Companion renders.

If you do not know The Companion as it is today, let us send you one or two current issues free, that you may thoroughly test the paper's quality.

Every new subscriber who sends $2.00 for the fifty-two weekly issues of 1915 will receive free all the issues of the paper for the remaining weeks of 1914; also The Companion Home Calendar for 1915.

THE YOUTH'S COMPANION, 144 Berkeley Street, Boston, Mass.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Oranges Between Peaches

Can you tell me through your paper if it would do to plant orange and leemon trees between peach trees (Lovells and Muirs), and can I grow them successfully that way, after some years taking out the peaches? My ranch is five miles northeast of Selma. The peach trees are 20 feet each way. Will that be room enough for the oranges and lemons? The soil is a white ash (no alkali) and I have had it tested at Berkeley. Where can I buy trees true to name? What kind of root should oranges be grafted on? How about the lemons? Is there any difference in flavor between valley and foothill grown oranges, also comparative price?—Subscriber, Selma.

It takes very careful work to start a new orchard with the old one still occupying the ground. Peach trees which have reached bearing age are practically interlacing their roots in the centers when planted 20 feet apart. If one would go down the rows with subsoil plow and cut off the roots which reach over to where the orange trees will be planted and then use care to give sufficient water and deep cultivation it is probable he could bring orange trees into bearing, but it is more likely that a bit of neglect at some time, with the peach trees drawing the moisture and fertility from the soil, will cause the orange trees to be much smaller than they would have been if planted by themselves. Twenty feet apart was at one time the rule for orange orchards, while 24 was the rule for lemons, but we believe the general practice today is to give rather greater space, 24 feet for oranges and perhaps 30 for lemons. However, there have been many profitable orchards planted at 20 feet. More water and fertilizer are of course necessary where planted so close. To secure trees true to name deal with reputable nurserymen who are wholly responsible. The stock to be grafted upon is usually the Florida sour orange. Most of the nurserymen are now using this. The difference in flavor between foothill and valley grown is not so decided as that of frost effect though of course trees which are grown where the weather is continually cool throughout the winter are more likely to be thick skinned and to show rag.

Avocado Seed

Would like information as to where to get avocado seed. Is the seed of the wild mango of the Philippines desirable to bud avocados to?—Subscriber, Fowler.

When avocado seed could be had from Mexico any seedsman carrying an advertisement in the Cultivator could have supplied you. At present, however, the state has quarantined against seed from Mexico because of a fly which is infesting many of the seeds brought from that section, but there are some native-produced seed which may possibly be had if application is made to the seedsmen. We have never heard of budding the avocado on mango.

Morning Glory

A subscriber writes from Orosi as to his experience with morning glory. It is well worth a thorough trial. He says: "Several years ago in Ohio I had a piece of ground infested with morning glory, the worst I ever saw. For years I tried everything I could think of, planted it to corn, potatoes, rye and wheat, and plowed the ground several times during the season, but without success. I wrote to Farm and Fireside for a remedy and they recommended sowing millet. The following spring I prepared the ground and planted millet, sowing it a little thicker than for hay, and it killed out the morning glory root and branch. If the inquirer will try this plan I doubt if he will have any further trouble. I tried this on two different pieces of ground with the same results. Be sure and have the ground in the best of condition so the millet will take root easily."

Violets in San Joaquin

In what kind of soil will California violets thrive best in this part of the valley?—Subscriber Hanford.

The soil for violets is the same in all parts of the world. It should be loose and friable, never baking to a close hardness. While pure sand does not produce good violets, a rich sand (full of humus) of any color but white is ideal. Soils cannot be too rich for violets except when there is an excess of nitrogen, which induces growth of foliage but not flowers.—E. B.

Mildew on Roses

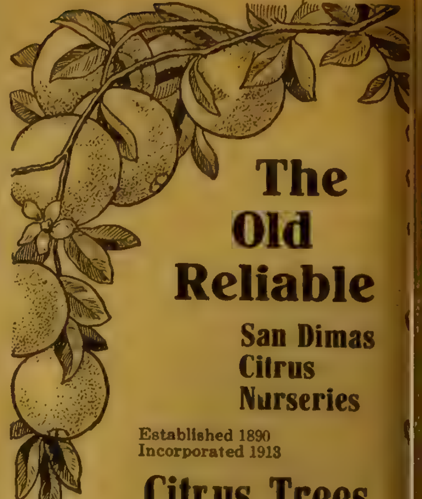
Leaves of rose bushes crumple up and at the joints of the thorns in the stems there forms a white spot. Have examined the bushes for lice but can find none, and they are not in a damp or shady place. They get the afternoon sun.—Subscriber, Los Angeles.

The "crumpling" of the leaves indicates downy mildew. The "white spot at base of thorns" proves it, for it is present there when apparent on no other part of the world. The causes are too many to specify. Combat mildew with sulphur very lightly dusted over all the foliage when the latter is wet with dew in the morning preceding a hot day. Heat of sun alone renders sulphur effective.—E. B.

Swellhead

I have two fowls whose heads are swollen and sore. It is difficult for them to breathe and they seem to wheeze.—Subscriber, Alta Loma.

Your chickens probably have swellhead, one of the many forms of roup, but I should examine the scratching litter and food for any trace of mould. Sometimes the mould spores lodge in the throat and mouth and grow there, causing difficult breathing, depression and death. For swellhead the kerosene treatment is as good as any. Put a teaspoon of kerosene on top of a lard pail of water and dip the chicken's head in so that it is entirely covered, holding it under while you count three. Then put the bird in a warm, sunny place, taking care that it roosts in an open front house with no draft, and feed plenty of animal food and greens. Repeat the treatment three days in succession. Don't forget to look for the cause of the trouble. Is there dampness in house



The Old Reliable

San Dimas Citrus Nurseries

Established 1890
Incorporated 1913

Citrus Trees Exclusively

All Leading Varieties

REMEMBER, MR. PLANTER

Practically anybody can grow a citrus tree, but it takes years of experience to produce a tree that will prove a money-maker when it comes into bearing. Nice-appearing nursery trees are desirable and promising, but do not always prove to be good bearing trees in the long run. Plant for profit and not for appearance only. Our trees are straight, thrifty, well rooted and have strong, full heads, but the main consideration is that: Our buds are carefully selected from heavy fruiting trees and will prove true-to-name revenue producers.

OUR TWENTY-FOUR YEARS

of experience in the growing and handling of citrus nursery trees gives the buyer the advantage of starting out RIGHT, thus avoiding disappointment at the end of four or five years' labor, in bringing the young orchard into bearing.

ANOTHER POINT TO CONSIDER

Growing a good tree is only part of having it do well after planting. Many a good tree is ruined in the taking up from the nursery and shipping. We give the best of service in the proper handling and delivering of our trees.

WRITE,

'phone or call on us before buying your trees. Tell us your wants and we shall be glad to give you the benefit of our wide experience as to planting, soil conditions, fertilizers, etc.

Our illustrated new booklet on citrus culture mailed to any address upon receipt of 25 cents.

QUOTATIONS GLADLY GIVEN

San Dimas Citrus Nurseries

U. S. A.

Teague trees are started right, grown right, and shipped right.

or yard, mould in the litter, a draft on the head at night, lack of fresh air in the roosting house? See above all that your drainage is what it should be. The only satisfactory way of treating any form of roup is to get rid of the cause.—J. A. K.

Dressing and Marketing Turkeys

Which would be the most profitable way to market turkeys, alive or dressed? Would like full instructions how to dress and handle for the market as I am new at the business.—Subscriber, Merced.

When a grower is without experience in dressing and shipping and has not a very large number of turkeys, it is usually safer to ship them alive. Dressed poultry brings a better price, but if it is not properly dressed and cooled it deteriorates very rapidly and the producer is the one who must bear the loss.

It might be worth while for you to advertise in some San Francisco paper for customers to whom you could ship dressed turkeys by parcel post, or you might, if you have access to a San Francisco telephone directory, select names of families in prosperous neighborhoods, to whom you could send circular advertising the superior qualities of your dressed turkeys, but it is a little too near Thanksgiving for that. Shipping alive to a wholesale or commission house is the easiest way, and it may bring as good results as any.

When preparing turkeys for market pen them 12 hours without food so that the crop will be empty when they are killed. When ready to kill hang up by the legs on a string attached to the ceiling so that the head is about four feet from the floor. Lock the wings together by bringing one over the other and catching the tip of the upper under that of the lower.

Market turkeys must be dry-picked with the heads left on, and this means that they must be killed by "sticking." Use a long, keen, sharp-pointed knife. While holding the head firmly with the left hand, plunge the knife down the throat and draw it twice toward the bill so that the jugular vein on each side of the throat is severed, then quickly push the knife through the roof of the mouth into the brain, giving it a slight twist. The aim is to slightly touch the brain and partially paralyze the bird so it will loosen its hold on the feathers. If too much of the brain is cut away the hold on the feathers is tightened instead of loosened. If the sticking is done exactly as it should be, the feathers will come out very easily, but to do it properly, requires considerable practice.

Begin picking as soon as the bird has been stuck, and when it is picked plunge it into a barrel of cold water for an hour. When you take it out of the water hold it head down and give a quick jerk to get rid of the blood that has accumulated in the throat. Hang up by the feet to dry and cool. The bird will be ready to ship as soon as it is dry and the animal heat has left the body. Your dealers will tell you how many to send at one consignment.—J. A. K.

Pruning

Should I prune walnut and Satsuma plum trees which were set out last spring? The trees have made a large growth, and I have been told that they ought to be pruned now, while some say to wait until spring.—Subscriber, Van Nuys.

We would prefer to prune all trees late in the winter, but if late pruning interferes with spring work, do it at any convenient time after the leaves ripen and fall. There are some exceptions to this; for instance, large cherry limbs should be cut off in the summer time. Apricots may be pruned any time after the fruit is off the trees. The only advantage in late pruning is in the healing over of wounds. If pruned early they are exposed that much longer before they begin to heal over. Walnut trees should be pruned before the sap starts.—J. W. M.

Barley or Rye

Having received request from a subscriber for information as to the comparative value of rye and barley as humus formers when used for cover crops, we wrote Mr. J. W. Mills, who sends us the following:

"I cannot give very accurate information on this question, as I never made close comparative tests. It is our opinion that rye would make the most green stuff. Were we to try this out we would plant part of each. In either case there would surely be an abundance of green stuff provided plenty of water were applied at the right time."

Dwarf Bartlett Pear

Where can I learn as to commercial value and productiveness of the dwarf Bartlett pear, together with information as to the acreage at present planted to this fruit?—Subscriber, Mountain View.

So far as known only a few varieties of pears do well on quince stock, others making a very unsatisfactory growth. We do not know of Bartletts being grown as dwarfs. Duchess de Angouleme is recommended to be grown as dwarf. Some authorities on pears say that perhaps most varieties would do well as dwarfs provided the blossoms are removed during the first and second years. All varieties of pears seem to improve in color and flavor when grown on quince root. We would suggest that the state board of horticulture might give information or data as to the extent to which dwarf Bartlett pears are grown in California.—J. W. M.

Wool Quotations

Noticed in one of your late issues a request for remedy for lice on goats. Angora goats must be dipped for lice once a year. Use a good strong dip, one that you will have to keep their heads out of. This may be made at home, but the commercial or ready-made dip is more economical.—G. A. Werth.

Boiled Potatoes for Poultry

Could you tell me if boiled potatoes stop hens from laying, and why, if so? —Subscriber, Gilroy.

Boiled potatoes, being composed mainly of starch, might easily fatten the hens to such an extent that they could not lay, if they were made a large part of the ration. Fed in small quantities, however, they are healthful and beneficial. I would boil a few each day and use them in a moist mash with bran, table scraps, cut-up lettuce or alfalfa, cooked vegetables or vegetable parings, and about 15 per cent of beef scrap or cooked meat or fish scraps. A sheep's pluck (liver and lungs) or the heads and tails of fresh fish, which your fishman will sometimes give you if you ask for them, cooked with the potatoes and vegetables, makes a very palatable mash. Do not use middlings or corn meal in the mash with potatoes, for they, too, are fattening, and do not use the potatoes too freely. They will be very valuable when you want to fatten young stock or old hens for market. For this purpose you can make them half the mash and use corn meal and middlings for the other

HAVE You Received *Your* Copy of "Progressive Cultivation"?

AMONG the hundreds of coupons we receive every month requesting copies of "Progressive Cultivation" there are always a few the senders of which have neglected to fill in the lines provided for the name and address.

We do not want any man to feel that we have neglected his request. In cases where name and address are lacking, however, we can do absolutely nothing.

Have you written for "Progressive Cultivation" and not received a copy? If so you probably mailed the coupon in a hurry and forgot to fill it out. Will you please send the one at the bottom of this announcement, giving your name and address in full. The book will reach you promptly.

If you have never asked for a copy of "Progressive Cultivation" it is high time you did. From cover to cover it is filled with money saving, time saving information. It tells how and when to use dynamite for sub-soiling, tree planting, irrigation work, rock and stump blasting, drainage work, excavating, felling trees, and many other purposes.

Thousands of farmers are now using Hercules Dynamite and with its aid doing more work and getting better results. If you are not among them please fill out the coupon below *fully* and mail it to us. Your copy of "Progressive Cultivation" will be sent you at once.

half. Whether the mash is for laying hens or market stock, it will be much better mixed with skim or sour milk. When milk is used meat is not needed.—J. A. K.

A Correction

In the reply to a Lompoc subscriber, in the Cultivator of November 12, page 474, the dry mash formula given should read "by measure" instead of "by weight." The difference is considerable, for some grains are much heavier in proportion to their bulk than others.—J. A. K.

Leg Weakness in Turkeys

Young turkey for two or three months has shown a peculiar leg weakness. We first noticed him stepping backwards, apparently to balance himself, and then it became gradually more and more noticeable, until sometimes he seemed to get tangled up with his legs and would fall or sit down. To-day we notice another fine gobbler affected in the same manner. Can you tell me the cause, and cure, if any? I suppose the turkeys are unfitted for eating.—Subscriber, Monrovia.

I think your turkey's legs must be weak either from lack of exercise or because there is too little bone-making material in the ration. You do not say whether or not they are confined. If they are this is probably the reason for the weakness. If they have all the range they want and still are weak I should blame the ration. A little fine ground bone in a bran mash two or three times a week would probably have remedied the trouble in the beginning. Turkeys require a good deal of bran which is a fine bone and muscle maker. Now the best thing to do, unless you wish to keep them for breeders, is to market them. The leg weakness does not unfit them for food in the least. Probably you will find them nice and fat. If you do not care to eat them, give them all the bran they will eat once a day and add a handful of ground bone three times a week, but above all make them exercise. If they won't go themselves, take a long stick and drive them.—J. A. K.

Chicken Pox

Can you tell me treatment for chickens that have sore eyes? First the lids swell around the eye till it is shut, then a thick tough pus forms over the eye and two or three lumps form on the comb like warts, some the size of a pea. One rooster I cured by putting peroxide in the eye but it came back. They don't seem to be sick, but eat heartily. I fed a little cotton seed meal in the mash for a while. Do you think that would cause it?—Subscriber, Whittier.

The lumps on the comb suggest chicken pox, which is often characterized by soreness of the eyes, just as it is in human beings. If the lumps increase in number, become yellow and finally dry up, treat for chicken pox by greasing them with carbolated vaseline and giving calcium sulphide, a grain to each adult fowl, in wet mash once a day till symptoms are improved. The eyes may be washed out with boric acid, half a teaspoon in a cup of warm water. It may be that this is a form of roup which affects the eyes, "roup of the eyes," it is called. It may be treated by washing the eyes out carefully twice a day with a two per cent solution of boric acid and chamomile flowers and syringing out the nostrils daily with two and one-half per cent solution of creolin and glycerine. If this is too much trouble try dipping the head once a day for three days in a lard pail of water on top of which is just a film of kerosene, or in water containing sufficient permanganate of potash to give it a good red color. Hold the head under while you count three, then remove the bird to a warm sunny coop and give a good, nourishing diet. Both roup and chicken pox are contagious, but chicken pox is very infectious as well. Quarantine all sick birds and clean up thoroughly or you will have it year after year. Look for moldy litter and for unwholesome conditions which cause disease. Perhaps your roosting coop and houses are too close and warm. Perhaps they are overcrowded or not very clean. Your chickens need just as much air and just as pure air as you yourself. I don't think the cottonseed meal had anything to do with the trouble.—J. A. K.

Guinea Fowls

Will you kindly advise me where I can get reliable information on raising and care of guinea fowls? Is it true that guinea fowl meat is becoming popular with high-class hotels? Do you believe that guinea fowls can be raised commercially at a profit? What is their ability as egg producers, and can they be successfully hatched in incubators and raised in outdoor brooders?—Subscriber, Calipatria.

An effort has been made in the east to boom guineas as a substitute for wild game but the boom has not reached California. There is absolutely no market in Los Angeles so far as I can learn for guinea flesh or eggs though the birds command a fair price as fancier's fowls. If you will notice the market reports you will see that while geese, ducks and turkeys are always quoted, guineas are never mentioned. This should in itself be a pretty good indication of the status of the bird. I do not see how guineas could be raised commercially at a profit when there is no demand for them for the table. Their eggs are said to be exceptionally fine, though small, but the public taste has not been educated up to them. Even in the east where guineas are bred much more generally than here and there is quite a demand for breeding stock and hatching eggs, their eggs have no market value. As the young birds are very hardy there would seem to be no reason why they should not be hatched and raised artificially, but I have never heard of their being raised in this way. The hens are very good layers, beginning in March or April and laying till late in the fall. The only publication I know of which gives information concerning the raising and care of guinea fowls is the American Poultry Advocate, published at Syracuse, N. Y., which has a department devoted to turkeys, waterfowl and guineas.—J. A. K.

Standard for Bourbon Reds

Is it permissible for a Bourbon Red tom to show a black rim on the back and fluff feathers? All my prize winners have a little black, and I have never yet seen a grown male bird without, but should like to know from good authority what is required.—Subscriber, Guasti.

The American Standard of Perfection for 1910, our highest and latest authority, gives the following requirements for color in Bourbon Red turkeys: Head and wattles rich red, changeable to bluish-white; beak, light horn at the tip, darker at the base; eyes, dark brown; neck, back, body, thighs, breast and fluff, deep, brownish-red; wing bows, deep brownish-red, primaries and secondaries, white; tail, white; shanks and toes, reddish-pink. The Bourbon Red is a new breed, derived from a cross, and is quite difficult to breed true to color, but it is plain from the above that the perfect bird has no black.—J. A. K.

Blackeye Bean

What is the value of the blackeye bean as a stock food when ground? How does it compare with oil meal, cotton seed meal, soy bean meal or the horse bean?—Subscriber, Arroyo Grande.

We are unable to find analysis of the California blackeye bean but it is in the cow pea class and, in fact, often called the cow pea, and in a table giving average digestible nutrients we find the cow pea analyzes crude protein 16.8, carbohydrates 54.9, fat 1.1, Soy beans analyze much richer in protein, as follows: Crude protein 29.1, carbohydrates 23.3, fat 14.6 Horse beans analyze crude protein 23.1, carbohydrates 49.8, fat 0.8; cottonseed meal, crude protein 37.6, carbo-hydrates 21.4, fat 9.6. Linseed meal analyzes crude protein 31.5, carbohydrates 35.7, fat 2.4. The dry matter in each case is practically the same, running from 85 to 93 pounds in each 100 pounds of meal.

The Richest Land in America

YUMA PROJECT COLORADO RIVER
SOFT SILT ALFALFA LAND

United States Government Irrigation System Now Completed, Furnishes Cheap Water

Richest and best Farming Land for intensive cultivation and plenty cheap water, never failing, from the Colorado River, the third largest river in the United States.

Several parties having about 5000 acres of this rich land under the Government Irrigation System close to Yuma a town of 5500 to 6000 people are subdividing this acreage into 10, 20 and 40 acres and larger farms, each on a county road. These county roads, north and south, are 70 feet wide, and east and west 66 feet wide, close to railroad.

The Government has the irrigation system and canals completed to this land and there is a lateral to each small farm. These small farms are surrounded by larger cultivated farms, fine alfalfa, barley, corn and cotton fields, dairy ranches, in a well improved part of the valley, all paying well and producing crops that cannot be produced in any other locality as abundantly. The climate is dry and most healthy and is the finest climate in the world for nine months each year; the other three months are warm, but not unbearable; men and teams can and do work all of the time without ill effects; sunstrokes and prostrations are unknown.

This is the greatest agricultural growing country in the world equal in all respects to the River Nile Valley and the great Chaldaean Plain. The lands are in the Delta Country of the Colorado river, rich from sediment, silt deposit, and produce immense crops continually without the necessity of fertilizing. The domestic water is good. The water for irrigation comes from the finest irrigation system in the world, built by the United States Reclamation Service, now completed at a cost of about $7,000,000. Main canals are 90 feet wide on the base.

Have pictorial booklet of the Land and Irrigation Project, glad to furnish, and plats showing locations.

Will sell these small farms on easy terms or exchange for lots, houses and lots, equities in same, or small acreage, and assume the encumbrance.

Glad to take you to see the land. Round trip rate $12.35 from Los Angeles, good any day. Call and see me or phone Garvanza 723. Will examine what you have and make you a proposition.

"DOE YE NEXTE THYNGE"

From an old English parsonage, down by the sea,
There came in the twilight a message for me.
Its quaint Saxon legend, deeply engraven,
Hath, as it seems to me, teaching from heaven,
And all through the hours the quiet words ring
Like a low inspiration, "Doe ye nexte thynge."

Many a questioning, many a fear,
Many a doubt, hath its quieting here.
Moment by moment, let down from heaven,
Time, opportunity, guidance, are given.
Fear not tomorrow, child of the king!
Trust them with Jesus, "Doe ye nexte thynge."—Anonymous.

WOMEN'S SESSIONS AT THE STATE FRUIT GROWERS' CONVENTION

THE women's sessions at the recent State Fruit Growers' Convention in Los Angeles were of great interest. A practical program was presented by women who have made successes in different branches of horticultture. Mrs. Hilda B. Neilsen of Sebastopol talked on jelly making. Mrs. Sara Roberts of Grass Valley sent a paper on home canning of fruits and vegetables, which was read by Miss Lilian D. Clark, in charge of the sessions. Miss Sessions of San Diego was also unable to be present and her paper was read by proxy. Mrs. Francis of Ventura spoke on opportunities for women in horticulture. Her address will be given at some length in a later issue. Mrs. Emily Hoppins' paper, "How Can a City Woman Make a Living in the Country," was the same as given at the June meeting at Davis, and our readers will remember enjoying it in the Cultivators of June 25 and July 2. Miss Ednah Rich of the State Normal School at Santa Barbara spoke on home economics for the woman in the country home. Short extracts from her address and that of Mrs. Neilsen are given below.

Home Economics

Notes from Miss Rich's address:

The economics of right living is what we all need to know. There is a broad paved highway to this knowledge and there is a street full of chuck holes. Most women go into home economics the longest way around. It has been said that the longest way around is the shortest way home but there are times when the longest way around is a round of experience which is not best or wise. I do not agree with the people who say that experience is the best teacher and then point to a garbage can full of wasted material. We must know how to do things.

Everything we do must have an object. We must have as that object one great big thought, and that thought is economics. Wasted energy comes through not knowing how to place things in the house in the right position. Perhaps you think because you have someone to do things for you it doesn't matter. Have you ever thought that the maid servant is a person like yourself? Have you ever thought that if you make things easier for her she will give better service? I wonder how many of you have fireless cookers? The particular kind you buy depends upon yourself. It may be a home-made affair, consisting of a cracker box filled with excelsior or hay, or it may be an electric one, but a fireless cooker you must have. Then will you put it on the floor so you must stoop every time you use it? I heard one woman remark: "I always mean to ask my husband to have the carpenter make a rack to put it on." Why not make it yourself? At least you can get a cracker box from the grocer. You say it is unpainted and would not look well? Why not paint it? These are the things where you can use your ingenuity and your wit.

You carry things all the way from the kitchen to the dining room because you have always done it that way. Why not put castors on the kitchen table and wheel it? Most kitchen sinks and washbowls are built 29 or 30 inches high. For the woman of ordinary height they should be 34 inches.

Make things as sanitary as possible by the use of paint. The waterproof paints and varnishes are splendid and make it possible to wash off the walls just the same as an enamelled surface.

Another thing we need to learn—and that is not to clutter up the house with useless ornaments.

I am not advertising any particular brand but I have learned that the portable vacuum cleaner earns its board and keep quickly. It will clean mattresses, walls, rugs and numberless other things.

The women of the state of California today have at their command the home economics department of the United States department of agriculture, of the college of agriculture of the university of California, and the state normal school at Santa Barbara. They may obtain bulletins on nutrition, bread making, jelly making, in fact, on almost any subject you can think of. At the normal we have a course in institutional management where you and your daughter may come, regardless of previous education.

The state protects you against impure food products. You can learn to test your coffee, tea, baking powder, extracts, etc. If you are in doubt about the quality of a certain brand of canned goods you may send it to the pure food commission at Sacramento and if it fails to come up to the required standard the manufacturer may be enjoined from again putting it on the market.

Some of the larger department stores of the country employ experts to give advice to customers in regard to textiles. Manufacturers are stamping ready-made clothes so we may know just what we are buying.

I often hear women remark: "I am not cultured, I am not musical, I can not paint, I can only keep house." They do not realize that "just keeping house" is one of the grandest things in the world and the woman who lives in the country is the most privileged of all the people in the world.

Jelly Making

HOME MADE ACETYLENE *Is not poisonous to breathe*

IN GRAY DRUMS WITH BLUE BANDS

The home paper will print your obituary in the next issue—if you ever "blow out the gas" when you visit your cousin in the city. But when your city cousin comes to your country home, he can blow out your acetylene gas light and it won't hurt him a bit to breathe it all night.

Your HOME-MADE ACETYLENE gas is much the best in many other respects. A hundred cubic feet of it will give you more light for your house and barn than a thousand feet of your cousin's city gas. Your light will also be far more brilliant and beautiful, and your acetylene cooking range will have every feature of the finest gas range used by the cities' millions.

To make acetylene for country home use you require an automatic generator. You simply feed this generator the gas producing stone, Union Carbide, about once a month — the machine does the rest.

The use of HOME MADE ACETYLENE has grown steadily while a hundred other competing light propositions have died by the wayside. Today we supply UNION CARBIDE to over a quarter of a million country home families.

Modern acetylene generators are wonderful improvements over the earlier kinds with which you may have been familiar. We will be very glad indeed to have you ask us any question that may come to your mind.

You will find our advertising literature intensely interesting. Address

The Future Mother

The young bride who is about to face the problems of housekeeping will find in Ghirardelli's Ground Chocolate, a wholesome and economical food-drink. Start housekeeping right by serving this nutritious beverage. It will make any meal taste better and will keep the health in perfect condition. Costs less than a cent a cup. For making desserts and candy it is without an equal. Tell your grocer to send you a can.

In hermetically sealed tins.

Ghirardelli's Ground Chocolate is the only original ground chocolate. It has been used in Western homes for over a third of a century and its popularity is growing day by day.

D. GHIRARDELLI CO.
Since 1852 San Francisco

While our price will not be increased during 1914, there will be no reduction in quality.

GHIRARDELLI'S GROUND CHOCOLATE

Mrs. Neilsen's article on how she came to take up jelly making as a business and her methods which have led to success. This was published in the California Cultivator of July 30 this year and was delivered at the women's sessions at the State Fruit Growers' Convention at Davis in June.

We will give here only a few notes taken at the Los Angeles meetings.

The question is often asked: "What can a woman do on a farm?" I think this might be answered by the question, "What can a woman not do on the farm?" There is handly any department of farm work in California in which some woman has not made a success and, in most cases, for the reason that the work has been forced upon her, and it was not until then that she realized her capabilities.

My first market was in San Francisco, but my first satisfied customers have been my best advertisements, and now orders have come to me from three states as well as Hawaii. Requests come in for jams and canned fruit as well as my jellies. I no longer seek my market—for the market has come to me—because my products represent my very best quality.

Let me whisper it to other rural women—the markets are not as easily found as one may think, but persevere, think and try every possible market and finally you will be surprised at how many openings you have found. But remember always that a satisfied customer is the best possible advertisement.

I have found my market in orders from lodges, high class hotels and clubs, mining camps and people living in the cities.

I might add that requests have come from my city customers for dressed fowls, as well as fresh ranch eggs. It seems to me that the market is unlimited, that in supplying the various ranch products, a new industry is open to the rural women of today.

Send for Farmers' Bulletin No. 203 by Maria Parloa on "Canned Fruits, Preserves and Jellies" and that will tell you all about it. Write to your representative or senator and he will have it forwarded.

Have a press for extracting juice, no matter if you make only a few glasses; you get all the juice and it is clearer. Jelly presses may be bought from $4.50 up. These can be screwed on the kitchen table. I use a cider press in the yard.

When juice has been pressed out I pour into a jelly bag made of two thicknesses of flannel of the 25-cent quality. To hold the bag in place I have a shelf over my sink. Into this is screwed a stout hook which holds the bag. If I could not have a shelf I would put in a bracket to hold the hook. It pays tö have the bag suspended over the sink to save work and make work easy.

In making exhibition jelly I put the juice through eight bags in order to have it as clear as possible, and in the eighth bag I find little particles of pulp. This very clear jelly is not a bit better tasting than the commercial jelly, but it is clearer. Another hint for exhibition jelly. Buy perfectly clear glasses. The clearest jelly in an imperfect glass will not attract the judge's eye.

In making all jellies I use a pound of sugar for a pound of juice. Do not put sugar in until juice is entirely cold, if you want clear jelly. (See "Use of Syrup Gauge" below for making sure you have added the right proportion of sugar.) Stir well and put on stove with not too hot fire, also to keep the jelly clear. Let come to boil slowly, set on back of stove and skim. Repeat this three times (bringing to boiling point slowly, setting off fire and skimming). Then put back on fire and boil as much as it needs.

Use the syrup gauge. Small size can be purchased for 50 cents and the glass cylinder for holding test liquid for 35 cents. These can be secured at any store handling laboratory supplies. The gauge and cylinder are made of good glass and should not break in use. They should, however, be heated gradually. (For use of syrup gauge see quotation from Bulletin 203 above referred to, at end of this article.)

When juice is nearing the jellying stage, again test with the hydrometer (syrup gauge). Take juice from fire, fill cylinder and test with gauge as directed before when sugar was added. When it registers 29 degrees (on the small Baume gauge) it is exactly at the jellying point and should be pooured into glasses immediately. In a half minute it may be 29¼ degrees and your jelly will be too hard; 29 degrees is just exactly right.

Strawberries will jelly perfectly if used very fresh and just a little green. If not in this condition add a little apple or lemon juice.

Cane Sugar—Beet Sugar

I have always used cane sugar, but this summer I made up my mind to try an experiment. I sent my husband to town to get beet sugar; none of the stores carried it because women would not buy it; they said it would not do for canning or jelly making. There was no beet sugar to be had in adpoining towns, so finally I had to send to Oxnard to the sugar factory. I made some jam with cane sugar and some with beet sugar and labeled them; that is the only way I can tell which was made with cane and which with beet. I made another lot and it was mixed before I had labeled it, and now there is no possible means of telling which is which. Chemists have told us that there was absolutely no difference; they can't tell the difference; do you think the housewife can?

USE OF THE SYRUP GAUGE

The syrup gauge is a graduated glass tube, with a weighted bulb, that registers from zero degrees to 50 degrees, and that is employed to determine the quantity of sugar contained in a syrup.

If this gauge is placed in pure water the bulb will rest on the bottom of the cylinder or other container. If sugar be dissolved in the water the gauge will begin to float. The more sugar there is dissolved in the water the higher the gauge will rise. In making tests it is essential that the syrup should be deep enough to reach the zero point of the gauge. If a glass cylinder holding about half a gill is filled to about two-thirds its height, and the gauge is then placed in the cylinder, the quantity of sugar in the syrup will be registered on the gauge.

Experiments have demonstrated that when sugar is dissolved and heated in fruit juice, if the syrup gauge registers 25 degrees the proportion of sugar is exactly right for combining with the pectin bodies to make jelly. The syrup gauge and the glass cylinder must both be heated gradually that the hot syrup may not break them. If the gauge registers more than 25 degrees, add a little more fruit juice. If, on the other hand, it registers less than 25 degrees, add more sugar. In making syrups for canning and preserving fruits, the exact amount of sugar in a syrup may be ascertained at any stage of boiling, and the syrup be made heavier by adding sugar, or lighter by adding water, as the case demands.—Farmers' Bulletin 230.

THE SHORTEST CUT TO THE BEST RESULT

The shortest cut to the best result—that is what we want these days in every department of life—in home economics more than all.

Did you note the first paragraph in Miss Rich's talk to farm women on this page? She says:

"The economics of right living is what we all need to know. There is a broad paved highway to this knowledge and there is a street full of chuck holes. . . . There are times when the longest way around is a round of experience which is not best or wise. I do not agree with people who say that experience is the best teacher and then point to a garbage can full of wasted material. We must know how to do things."

The short cut on the broad highway to good meals prepared economically (in labor as well as money) is clearly mapped out in "Lessons in Cooking Through Preparation of Meals." Published by the American School of Home Economics of Chicago. You may secure this through the Cultivator Publishing Company for $2.00, postpage prepaid, or in combination with the Cultivator for $2.85.

Two dollars may seem too much to pay for a cook book, but not for this one; it is like no cook book you ever saw before. The publisher says: "The problem of home cooking is not only how to cook various separate dishes but how to prepare whole meals. This book gives a systematic course in cooking through a series of graded menus, with detailed directions not only for cooking the separate dishes but also for preparing and serving each meal as a whole.

The book is divided into 12 chapters, each devoted to one month of the year, beginning with September. First are given tables of weights and measures, equivalents of pounds, cups, tablespoons, etc., cooking time tables, thickening agents, leavening agents, shortening, flavoring, arrangement of kitchen, setting the table, etc. Then beginning with Monday's breakfast menus are given for each meal for a week with recipes for every dish used and very complete directions as to how to proceed with least waste of time, effort and food materials. Then are given pages of helpful suggestions, followed by table showing detailed cost of food and food values for each day and suggestions for reducing the cost of menus.

The same plan is followed in each of the 12 parts. As samples of the rest of the book we give outline of January and July menus:

January Menus: Fuels and Fuel Economy, Coal, Coke, Wood, Gas, Gasoline, Kerosene, Alcohol, Electricity, Reading Gas and Electric Meters; Informal Luncheon Menu, Recipes, Table Decoration and Method of Serving; Fireless Cookers and Their Use; Cost of Food and Food Value; Reducing the Cost.

July Menus: Pickling Fruits and Vegetables; Canning Vegetables, Recipes; Picnic Dinner Menu, Suggestions for Packing, etc.; Children's Party Menu, Recipes, Table Decoration, Methods for Serving; Cost of Food and Food Value; Reducing the Cost.

Also we quote directions for one Saturday morning baking:

Yeast Bread—Short Process.—Scald 1 c milk, add 1 c boiling water, pour into a large mixing bowl or bread riser, add 2 T lard, 2 t salt and 1 T sugar. When lukewarm, add 1 cake of compressed yeast which has been softened in ¼ c lukewarm water, mix well and sift in 6 c bread flour. Beat well with a spoon and add sufficient flour to make a dough which can be handled. Turn on to a floured board and knead thoroughly. Let rise in the mixing bowl till double its bulk, knead, form into loaves, place in greased baking pans, let rise till double its bulk, and bake in a moderate oven about 1 hour until the loaves shrink away from the pan. For further directions see article on Bread Making, page 211.

Pound Cake.—Cream ½ pound butter, add gradually ½ pound or 1 c of sugar, and beat well; add the yolks of 5 eggs beaten uuntil thick and lemon colored, whites of 5 eggs beaten until stiff and dry, ½ pound or 2 c of pastry flour, ¼ t mace and ½ T vanilla. Beat vigorously 5 m. Bake in a deep pan 1 h in a slow oven; or 30 to 35 m if baked as small fancy cakes.

Fig Turnovers.—Mix and sift 2 c flour, ¾ t salt and 4 t baking powder. Rub 1½ T butter into the flour; then beat 1 egg, add to it 1 c milk, mix and add gradually to the flour. The dough should be soft but not wet. Turn out quickly onto a floured board, roll into a sheet ½ inch thick and cut into rounds with a biscuit cutter. Dip a knife handle into flour, press down in the center of each biscuit, making a sort of hinge; have ready 8 or 10 figs chopped fine. Put 1 T of the fig mixture on half of the roll, brush over lightly with white of egg, fold over the other half, pressing the edges well together. Bake in a quick oven 20 m. Serve warm with cream and sugar.

Jellied Veal.—Cover a knuckle of veal broken into small pieces with boiling water and let simmer until tender, together with a few slices of carrot, half an onion and a stalk of celery. Drain, reserving the broth; remove all meat from the bones, return the particles of gristle, skin and bones to the broth, put over the fire and simmer until reduced to 1 c. Strain, set aside and cool. When the meat is nearly cold cut in cubes or chop fine, remove the fát from the broth, reheat and stir the veal into it, adding salt, pepper and any other seasoning desired. Decorate a mould with slices of hard-cooked eggs, pour the veal mixture into this, cover with buttered paper, press down with a weight and let stand until cold and set. Serve sliced thin.

Method of Work.—Start the bread the first thing after breakfast. Then put the veal on to cook and make the pound cake; while baking, make the fig turnovers for luncheon. Knead the bread and set it to rise. Then, if necessary, make a supply of salad dressing, following directions given on page 29. Knead the bread a second time, if desired, shaping loaves, let rise and bake.

Abbreviations: Teaspoon t, tablespoon T, cup c, minute m, hour h.

If your daughter is starting to make a home of her own no one thing could give to her the ever-present help contained in this one volume. No Christmas gift would be more appreciated by any housekeeper.

IDEAS FOR THE COOK

Written for California Cultivator

By Isabel Cottle

Dinner

Broiled Mackerel
Cream and Butter Dressing
Baked Potatoes
Banana Fritters Coffee

Lunch or Supper

Cream of Onion Soup
Stuffed Egg Plant
Hot Cheese Sandwiches
Lettuce and Apple Salad, French Dressing
Cranberry Pie Tea

Dinner

Viennese Chicken, Browned Riced Potatoes
Creamed Brussels Sprouts
Sliced Tomatoes
Sponge Cake Coffee

Cream of Onion Soup

Melt one-fouth cup of butter, add a pint of sliced onions and cook slowly for 15 minutes, closely covered to prevent browning. Add three cups of water, salt and pepper, and a bit of parsley. Let this simmer for three-fourths of an hour, then rub through a sieve. Have in readiness three cups of milk in which a bay leaf and bit of mace have been slowly heated, thicken with a scant tablespoon cornstarch. When thoroughly cooked strain the last mixture into the puree, stir well and serve with grated cheese, a tablespoon for each service.

Viennese Chicken

Clean and cut a fat fowl into pieces as for frying. Simmer with a bay leaf, parsley, a little lemon juice and seasoning until tender and let cool in the stock. Drain well. Egg and crumb each piece as for croquettes and fry in deep fat. Serve with sauce made from thickened stock, chopped mushrooms and parsley.

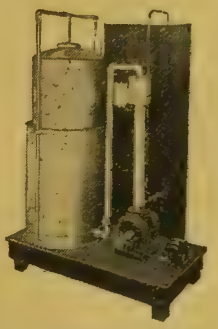
Cranberry Pie

One cup cranberries, cut in halves. One cup sugar mixed with 1 heaping tablespoon flour; one-half cup cold water and a little butter. Bake in one crust, with strips across top.

Sponge Cake

Four eggs, one cupful of sugar and one cupful of flour are all this cake requires. It is all in the putting together and the baking. Beat the whites very dry and fold in the sugar, one-quarter of a cupful at a time. Add the yolks of the eggs, one at a time,

(Continued on Page 543.)



The "OLIVER" Gas Generator

Unsurpassed for Simplicity and Economy

A 50-light plant for Cooking, Heating or Lighting, for $1.00.

Uses ordinary motor gasoline. No heat, or adjustments, required.

An even gas, under varying conditions, always on tap.

No trouble to install.

The least expensive, yet best, gas generator ever introduced.

A product of California.

HAY

Under date of Nov. 21 Scott, Magner & Miller say:

Receipts of hay for the past week were 1681 tons, quite a decrease from the previous week of 2771 tons. Practically the entire receipts continue to be of the medium and poorer grades. Fancy hay of any description sells out of proportion to all other grades whenever received, but is very scarce. Most of the shipments are from the warehouses; the fields being practically cleared with the exception of where hay has been piled up and covered over with the intention of carrying it until spring. Plowing is going on in all districts where dry plowing can be done. Other sections are awaiting the rains, which are quite late but no doubt will come along in due time. Some hay is moving for export right along, although not in any large quantities with the exception of 1000 tons which were shipped during the week to the Philippines for government account.

Arrivals of alfalfa have been quite heavy. Straw is normal. We quote wholesale prices in carload lots as appear from dealers' transfers upon the hay market. For prices to consumers, charges of cartage, commission and handling expenses must be added according to conditions.

We quote the average wholesale prices on carload lots on today's market as follows:

Fancy Wheat Hay, lt. bales	12.00@13.00
No. 1 Wheat or Wheat and Oat	9.00@11.00
No. 2 Wheat or Wheat and Oat	6.00@8.50
Choice Tame Oat	10.50@12.00
Other Tame Oat	6.00@9.00
Wheat, Cal. Club	1.95@2.00
Barley	5.00@7.50
Wild Oat	6.00@8.00
Alfalfa	6.00@9.00

WEATHER CONDITIONS

For Week Ending November 21, 1914.

Report from the various stations of the U. S. Weather Bureau, by Geo. H. Wilson, director, San Francisco:

Citrus Fruit Market

LOS ANGELES, Nov. 24, 1914.

Central and Northern California are sending out some of the finest fruit ever put on the market; it is coming up to the test recommended by the department of agricultural and has a magnificent appearance. A few points in Southern California have a little fruit which will also stand the test and it is excellent quality, but in general the southern end of the state will do but little shipping for a month yet. Tulare County shipments are now going forward at the rate of about 100 carloads a day and will probably increase for a few weeks.

Lemons are going forward at the rate of about 15 or 20 carloads daily and are being well received the country over, though owing to quality prices are declining and at present $2.75 to $3.00 is about the limit for good fruit.

Shipments

Shipments of oranges to date from Southern California since Nov. 1, 251; lemons, 217; total, 468. To same date last season, oranges, 13; lemons, 53; total, 66. From Tulare County to and including Nov. 20, oranges, 153; lemons, 42; total, 195. From Butte County to Nov. 20, oranges, 34 cars.

CLTIVATOR MARKETS ONE

CURED FRUIT BULLETIN

SAN FRANCISCO, November 2, 1914—Packing and shipping has been keeping everyone busy so the volume of new business has been very small. The trade generally has been buying from hand to mouth, or only for their immediate requirements, so it is reasonable to suppose that they will commence buying earlier than usual this winter.

Although buying has been very light, the market is in a depressed condition. Some difficulty has been experienced in filling prune orders on account of the scarcity of some of the smaller sizes, 60s to 90s being the scarce sizes in most districts, and even with this the prune market has a very easy tone.

It is expected that later England and other foreign countries will be in the market for dried fruit. Up to the present time a great deal of uncertainty has attended shipments to these countries, the great difficulty being the fact that England is trying to keep the smaller neutral countries from allowing shipments to be made through their domains to Germany and you know that Germany has been a very heavy buyer of California fruits, so the loss of her trade makes quite a difference in our home markets as this forces goods that usually would have been sold abroad onto our own markets, so we prefer to keep the fruit in our possession until such time as matters adjust themselves and shipments can be handled with a greater assurance of protection to the shipper.

The quality of apricots differs very materially in the different districts, which accounts for the range in prices. Buyers are showing very little interest in this article, so sales are slow.

We believe that peaches have gone as low as they will go, and the low prices prevailing ought to stimulate consumption. The two grades of this variety which are shortest are fancy and extra fancy.

Packers and buying trade were rather upset when we were advised of the slides which had occured in the Panama canal, as a great deal of fruit was in transit at that time, but the government, which is usually prepared for such emergencies, after a few days announced that the canal was again open for business, but we are liable from time to time to be subject to small delays on account of the magnitude of the work and the possibility of there being some weak spot in the construction.

Raisins are being quoted by some at lower prices than the Associated Raisin Company is making. We believe a little later when the rush is over that the dried fruit market, generally, will settle down, preparatory to the winter trade. We also believe that with the opening of the federal banks we shall see things brighten up, that money conditions will be easier, but the effect will not be felt in buying until after the first of the year. Conditions which exist today have been helped along by the general feeling of pessimism and depression that exists, more than by actual conditions—everyone having made up his mind that times are bad, whether they are or not—so if everyone would look on the bright side of things and make up his mind that things are going to be all right we would soon see a change because the resources of this country are large. But while we have a right to hope let us not deceive ourselves into a belief that the high prices which prevailed for a short time at the opening of our season will return; there is nothing upon which to base that belief, we shall have a market—now, there is none.

It is only a temporary set-back, and business will soon be more flourishing than ever, and is already getting better, and the demand for our products will be much increased, so don't be discouraged—the sun is rising clear and the future will be bright.—California Cured Fruit Exchange.

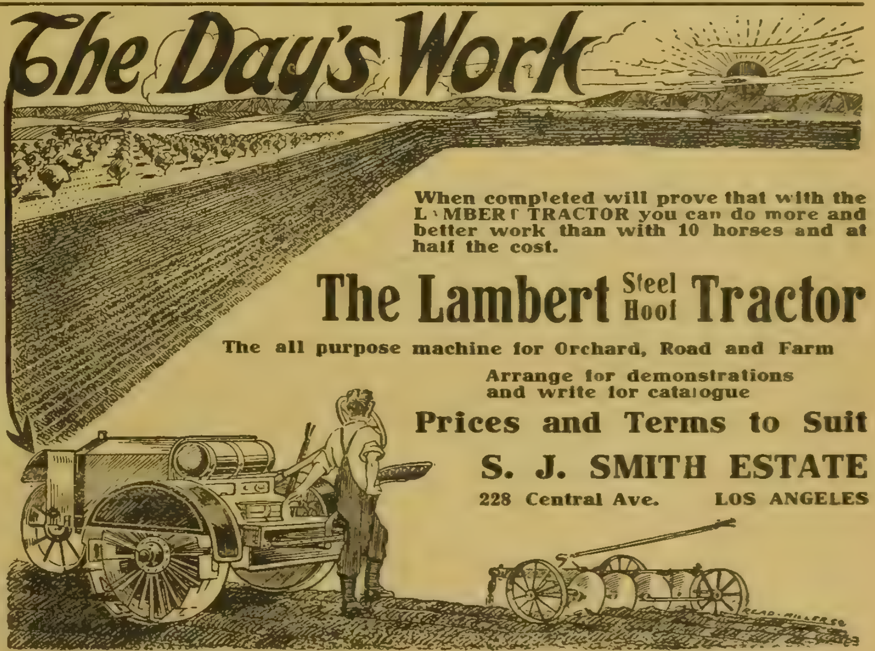
IDEAS FOR THE COOK

(Continued from Page 541)

cutting each in half with the cake beater, and cutting them into the whites and sugar so lightly that it will be streaked with yellow. Cut the flour into the mixture in the same way and put in buttered pan and bake three-quarters of an hour in a very moderate oven. When it is ready for the oven it should show streaks of flour and yolks. Don't be afraid when you see it all streaked. It is all right. If you stir more you will spoil the cake.

SALE OF HOLSTEINS

Geo. A. Smith of Corcoran has made some record in pure bred live stock sales and is ambitious to make Corcoran the greatest sale center in California. His ambition will be realized if he keeps on offering the blood lines which he has in the past. Now comes the finest offering ever with 80 registered Holsteins which will go to the highest bidder at his sale Saturday, December 12. Regarding some of his offerings, Mr. Smith says: King Segis. Hengerveld De Kol 2d's Butter Boy 3d, Sarcastic Lad, Johanna Colantha Lad, Judge Hengerveld De Kol, Pontiac Hengerveld Parthenea, Duchess Ormsby Piebe Burke, Jessie Maida Paul De Kol Burke and other famous sires will be represented by their sons, daughters, grandsons and granddaughters. Sell some of your boarders and get some money makers.



When completed will prove that with the LAMBERT TRACTOR you can do more and better work than with 10 horses and at half the cost.

bigger profits
THE YUBA BALL TREAD TRACTOR

The Yuba Ball Tread Tractor—bigger profits—the use of one means the realization of the other.

Careful designing, the use of high-grade materials, and accurate construction reduce the cost of maintenance to a minimum.

The Yuba Ball Tread Tractor is built to stay built; every part is able to stand much heavier strains than can possibly be put on it in the course of service; wear on each part is very slight in proportion to the work done; but should it become necessary to replace any part, it can be done at small cost, in the field, by the operator. The elimination of big repair bills and the fact that The Yuba Ball Tread Tractor can be used for hauling, or as an emergency stationary power plant, every day in the year, make it an exceedingly profitable investment.

THE YUBA BALL TREAD TRACTOR

As a business precaution you should investigate The Yuba Ball Tread Tractor. This booklet points the way to bigger profits.

A Fruiting Date Palm

The Coachella Valley is Proving Wonderfully Adapted to the Growing of Dates, as is Proven by the Government Experimental Garden and Many Private Plantings

Courtesy Coachella Valley Submarine.

I Am Positive That These

40 Acre Equipped Farms

Will Prove Immensely Profitable

This photograph shows wheat growing over five feet high. It was taken on a strip of 1200 acres immediately adjoining these FORTY-ACRE EQUIPPED FARMS.

I ADD TO THIS LAND, FOR EVERY PURCHASER, THE SEED AND TREES BEST SUITED TO IT. A SELECTION OF ALMOND, APRICOT, PRUNE, PEACH AND FIG. FOR PLANTING ALONG THE ROADWAY, OLIVE, LEMON, ORANGE AND WALNUT TREES.

MY SPECIAL KNOWLEDGE OF TREES AND THEIR ADAPTABILITY GIVES YOU ASSURANCE THAT THE TREES WILL BE THE BEST POSSIBLE TO SECURE AND THAT THEY WILL BE SUITED TO THE SECTION SELECTED.

I also furnish a complete selection of seeds, including corn, beans, milo, alfalfa, rice and grain. YOU CAN ARRANGE THE ACREAGE FOR EACH ONE AS BEST SUITS YOUR INCLINATIONS. I WILL SUBSTITUTE POULTRY IF YOU DESIRE IT.

In Addition to This I Furnish a Plow, Harrow and Cultivator

And further, I bore you a well and install the pumping plant complete. TURN ON THE SWITCH AND THE WATER WILL FLOW. There is ample water in this section for all purposes and it can be drawn from one well.

THE PRICE. All of this at $150.00 per acre. One quarter down and the balance to suit.

Dudley Moulton.

Formerly Agricultural expert, United States Department of Agriculture and deputy State Commissioner of Horticulture of California.

They are completely equipped farms — Fertile fields that now require only ability and energy to change them into homes and make them bloom into rich harvests.

LOCATION. This choice land is in the Sacramento Valley, not far from the foothills. It is the alluvial land of the high Sierras that Nature has washed down through centuries of time and purified and fertilized with the warm air and sunshine of a true Thermal Belt.

THERE IS A GOOD MARKET OUTLET FOR YOUR PRODUCE. The great bay region of California, comprising San Francisco, Oakland, Berkeley and Alameda, is within ONE HUNDRED AND FORTY MILES OF THIS LAND. It is on the Southern Pacific and Western Pacific Railroads and there is a station on the tract. ALL TRANSPORTATION PROBLEMS HAVE BEEN SUCCESSFULLY MET.

This should be one of the best developed farming sections in the entire state within a few years and make a profitable investment and a comfortable home for every buyer.

LAND VALUES WILL INCREASE WONDERFULLY AND PURCHASERS WILL SECURE A CONSIDERABLE ADVANCE OVER PRESENT PRICES. THE LINDSAY AND PORTERVILLE DISTRICT WAS SIMILAR TO THIS TEN YEARS AGO.

I want to talk with every one who is interested in securing a specially located piece of land. I want them to see this property and to know the prospects of increasing values that await those who purchase now.

YOUR EASTERN FRIENDS WOULD BE INTERESTED IN THIS LAND. Give me their names and I will send them, absolutely free, a three months' subscription to the California Cultivator. They will learn much that will interest them from its pages.

Write me for further particulars relative to this opportunity to establish yourself on a profitable and fully equipped farm.

Rural Californian combined with California Cultivator
Vol. XLIII No. 23 LOS ANGELES: THURSDAY, DECEMBER 3, 1914 One Dollar Yearly

Notes on International Fruit Trade

Written for California Cultivator by Dr. F. Franceschi, formerly of Santa Barbara, Now of Florence, Italy. The United States Ranks Third in Exports of Fruit

ONE hundred years ago there existed hardly any international fruit trade, with the exception perhaps of a few dried fruits, like currants, almonds, walnuts, etc. In our day in every country it runs up into millions and millions of dollars.

While complete and reliable statistics are lacking about the fruit production of the different countries, positive and detailed information is available concerning imports and exports of fruits of the United States as well as of many European countries.

Imports of fruits rank as follows:

Great Britain	1911	$84,700,000
Germany	1912	56,500,000
United States	1912	31,400,000
France	1912	18,300,000
Austria-Hungary	1912	14,700,000
Italy	1913	2,300,000
Spain	1911	600,000

In proportion to acreage and population the respective percentages are as follows: Great Britain $9.26 per acre, $1.85 per inhabitant; Germany $4.56 per acre, 86 cents per inhabitant; United States 2 cents per acre, 33 cents per inhabitant; France $7.26 per acre, 47 cents per inhabitant; Austria-Hungary $1.14 per acre, 28 cents per inhabitant; Italy 31 cents per acre, 7 cents per inhabitant; Spain 21 cents per acre, 3 cents per inhabitant.

Exports of fruits rank as follows:

Italy	1913	$45,800,000
Spain	1911	26,700,000
United States	1912	24,000,000
France	1912	18,400,000
Great Britain	1911	8,750,000
Austria-Hungary	1912	6,320,000
Germany	1912	1,350,000

It is to be remarked, however, that the largest portion of exports from Great Britain and Germany is simply "re-exportation" of articles imported from abroad; also that it is the same with a small portion of exports from Austria-Hungary and from France. Exports from Italy, Spain and the United States appear to be almost entirely of national production.

Therefore percentages are given only of the following countries in regard to area of territory and of population: United States 1 cent per acre, 25 cents per inhabitant; Italy $16.14 per acre, $1.33 per inhabitant; Spain $12.00 per acre, $1.39 per inhabitant; France $2.60 per acre, 47 cents per inhabitant; Austria-Hungary 37 cents per acre, 12 cents per inhabitant.

The apparent disparity between the figures of Italy and Spain in the two columns is explained by the fact that the surface area of Italy is not much over half the surface area of Spain, while the population of Italy is nearly 35 millions and that of Spain not much over 19 millions.

The total yearly trade between exports and imports of citrus fruits resulting, from official statistics, amounts to about $70,000,000, namely: Oranges $46,000,000, lemons $18,600,000, citrons, citric acid, etc. $5,400,000.

Spain is the largest exporter of oranges, $10,000,000 in 1911; while Italy is the largest exporter of lemons, $9,500,000 in 1913. Great Britain is the largest importer of oranges, $11,140,000 in 1911; the United States is the largest importer of lemons, about $3,000,000, in 1912, all of them from Italy.

The total yearly trade of fresh fruits amounts to about $168,200,000, being subdivided as follows: Table grapes $19,000,000, apples and pears $63,200,000, apricots and peaches $2,050,000, plums and cherries $6,150,000, bananas $56,000,000, pineapples $14,800,000, other fresh fruits $7,000,000.

The United States is the largest buyer of bananas, $14,500,000 in 1911, also pineapples, $3,600,000. In exports of apples and pears Italy holds the record above all other countries with $7,160,000 against $5,570,000 exported by the United States, $4,170,000 exported by Canada, $3,030,000 by Austria-Hungary, $2,360,000 by France, and $2,310,000 exported by Australia and Tasmania.

The total yearly trade of dried fruits amounts to about $184,500,000, being subdivided as follows: Raisins and currants $45,800,000, dried figs $12,050,000, prunes $15,400,000, dried apples and pears $6,090,000, dried apricots and peaches $7,390,000, almonds $32,500,000, pistachio nuts $1,150,000, walnuts $20,000,000, filberts $20,000,000, dates $8,500,000, carobs $5,200,000, chestnuts $4,400,000, sundry nuts and dried fruits $6,000,000.

The United States is almost the only exporter of dried apples, pears, apricots and peaches, of about $3,300,000 of prunes, and of $1,000,000 of raisins. On the other hand it imports $4,500,000 of walnuts, $3,000,000 of almonds, $1,500,000 each of currants and olives, and $1,000,0000 each of filberts and dried figs.

Greece is almost exclusive exporter of currants, while Asiatic Turkey exports the greatest bulk of raisins. Dried figs are exported principally by Italy and Turkey, about $2,000,000 each, and in smaller quantities by different countries. Next to the United States, Austria-Hungary and France are the greatest exporters of prunes, of which Germany is the largest buyer, $6,095,000. Of almonds the largest producers and exporters are Italy and Spain, each of them taking about $5,000,000, and the largest buyers are Great Britain and Germany, for about $4,000,000 each. The greatest exportation of walnuts is made by France, and the greatest importation by the United States, for $4,000,000 in round figures. Filberts are exported principally from Italy, $2,350,000, also from France, Spain and Turkey, while the greatest buyer is Great Britain for over $4,000,000. Italy is again the largest exporter of chestnuts, for $1,500,000, and Austria-Hungary the largest buyer, for about $500,000.

The total trade (exports and imports) of fruits preserved in different ways may be valued at about $20,000,000, of which $3,000,000 are exported by the United States and $2,000,000 by Italy. Statistics are however far from complete and rather confusing on account of different methods of classification in different countries.

Figures given do not certainly cover the whole fruit trade in every part of the world, but one can learn from them the comparative commercial importance of the different fruits, also which countries are the largest producers and which are the largest consumers.

Celery in California

S. S. Rogers Writes for Cultivator Readers of Methods of Cultivation, Bleaching and Harvesting of One of California's Most Profitable Crops. Mr. Rogers Has Had Wide Experience with This Plant in Nearly All Sections of California

CELERY growing in California, due to the favorable climatic, soil and moisture conditions found in certain sections of the state, is one of the leading agricultural industries. Most of the celery which is produced in California is sold in the eastern markets at the season of the year in which it is impossible to obtain that which was locally grown. There is also a considerable amount handled in the Washington, Oregon and Idaho markets. There is probably no other vegetable which is capable of giving as large returns per acre, providing the local conditions are adapted to its culture.

The leading centers for production of celery in California are situated between Sacramento and Stockton, throughout the delta sections, and in Orange and Los Angeles Counties. There is also considerable celery grown in other sections of this state by the market gardeners, and this product is generally consumed locally.

During the past ten years the approximate amount of land annually devoted in California to celery growing is estimated to be between 5000 and 6000 acres. Prior to 1908 the most of this land so used was situated in Southern California, but from then on, and especially during the last three or four years, the amount of land devoted to celery in Southern California has rapidly diminished with the corresponding increase of the acreage in the northern sections in the vicinity of Stockton.

Although the returns are normally very satisfactory from the cultivation of this crop, the conditions under which it can be grown economically are very exacting, and the various field operations require considerable experience, so that one should not plant too large an area to celery without having actual experience. Below will be found a few directions or suggestions for growing celery under California conditions.

Soils Adapted to Celery Growing

Celery is very poorly adapted to wornout or impoverished soils, and should be planted only where the soil is rich in the essential elements of plant food, and where there is sufficient humus so that the soil will not bake. Celery will grow in several types of soils, the one most universally used being peat. Very heavy, stiff adobe and coarse, gravelly soils should be avoided. Often times the yield is larger on heavier class of soils although it is difficult to start the young plants.

Seed Bed

Celery seed in California is sown directly in the open, the beds varying from six to twelve feet in width, and as long as desirable. The time of

(Continued on page 555)

COMMON SENSE
IN BUYING TREES

Many planters overlook the importance of buying good trees.

The first cost of the tree is the smallest item. You spend years of time and lots of money before you know what your trees will produce.

So-called "cheap" trees are seldom cheap.

It is the extra fancy fruit that sells quickly and brings big profits. Thousands of growers will tell you that Roeding's trees grow true to name and are the most satisfactory kind to plant. We grow everything that grows, but specialize on fine citrus and olive stock.

Free Service

We have a special service to offer every purchaser of our trees, that costs you absolutely nothing. It means protection for you against costly mistakes—help in planting, pruning, spraying, irrigating, marketing, etc. Write today for further information.

Write or Call and See Us

Send us your list of what you expect to plant this season and we will be glad to quote our lowest prices and offer our suggestions.

Citrus and Tropical Fruits

IMPROVEMENT OF CITRUS FRUITS BY BUD SELECTION

By A. D. Shamel

(Continued from last week)

WE believe that all of the citrus types under observation originated from bud sports or variations. We have traced all of them to individual fruit and to similar limb variations in standard varietal trees. We have propagated most of these typical limb sports and reproduced the existing types in this manner. Therefore it seems safe to attribute the origin of our types to bud sports and their distribution to unintentional propagation, in such instances, certainly, as the propagation of unproductive and undesirable types.

The discovery of the origin of these types from bud variations has an important bearing on methods of citrus propagation. We have found certain individual trees bear all of the types of that particular variety from a single original bud. Other trees bear many variations of type, while in the case of still other trees we have not been able to find any type variations during our performance record work. In the propagation of a particular type it seems reasonable that buds should be cut from trees where only the type desired is found. Trees with many diverse types should be avoided as a rule as a source of buds.

We have used the fruits as indicators of the character of the buds, and have propagated only from trees when in fruit and from limbs on these trees bearing the type of fruit desired. We have found it to be practical to use only buds from the fruit spurs which produce the type of fruit wanted. Whether this method of bud cutting is absolutely necessary or not, we are not in position to say at present. We can say, however, that this kind of budwood has been used very successfully in our work.

There are several theories to account for bud sports. We are not ready to contribute or advocate any theory to account for this phenomena as yet. It is likely that continuous observation of bud sports will throw some light on this matter. We are mainly concerned at this time with the matter of the practical control of bud variation in its relation to the propagation of citrus varieties. We have made considerable progress along this line, sufficient to warrant the statement that the matter of bud control in citrus fruits is both feasible and practicable.

Isolation of Types

By isolation of types we mean the sorting out of the diverse types that occur in our citrus varieties by bud selection. While we do not claim that it will ever be feasible to eliminate variations in these types, we have enough real evidence to prove that the variation can be controlled by bud selection based on performance records and definite tree knowledge. Our progeny tests now coming into fruiting show that some of the parent trees breed uniformly true to type the percentage of variation from type being less than one-third of one per cent in the tests observed so far This condition warrants the statement that when parent trees are found which transmit their characters uniformly, the progeny of such trees can be considered to all practical intents and purpose to be fixed in type

The isolation of types by bud selection is the first important matter for consideration by nurserymen. The propagation of productive and desirable types adapted to particular conditions of soil, climate and other circumstances means greater profit to the grower without increase in the expense of culture.

Pedigreed Trees

The performance records of a parent tree and its progeny constitute to the mind of the writer a pedigree record of the parent tree. The greater the number of performance records and the greater the number of bud generations observed, the more valuable the pedigree records become. Parent trees with performance records of one or more bud generations or their progeny can be truly said to be pedigreed trees.

This term has been claimed to have been so widely abused in the advertisements of nursery stock that it is said to have fallen into disrepute. However, it is the only term advanced to date that covers the ground fully. The terms registered trees and select trees have been suggested as possible substitutes for pedigreed trees, but these suggestions have not met with any general favor as yet.

In this connection the criticism has been advanced that inasmuch as the term pedigreed trees has been abused, the whole matter of honest efforts to propagate select trees is doomed to failure. It would be equally appropriate to say that because the registration of dairy cattle or the dairy cow pedigree records have been abused by dishonest breeders, the whole system of cattle registration and cattle pedigree records is a fraud.

The exact terminology of this subject can only be settled during the gradual evolution of the subject as a whole. The terminology is relatively the least important of the problems involved or questions under serious consideration. Also because

Olive Trees

Olives worked on Picholine Root have stronger growing and deeper feeding root systems than those grown from cuttings.

Our Olives are worked on Picholine Seedlings, the wood being cut from trees having a record for productiveness and size of fruit.

They are prize winners—the kind you want. Write *Us* FIRST.

The Silvia - Bergtholdt Co.
"Fruit Tree Specialists"
P. O. Box A Newcastle, Calif.

the success of honest efforts for the improvement of citrus fruits by bud selection may be taken advantage of by unscrupulous persons for unfair practices, there is no more legitimate reason for discrediting the work as a whole, than in the case of the success of improved seed corn varieties, where dishonest seed corn dealers attempted to advertise and sell so-called select and pedigreed seed corn, which was neither select nor pedigreed in any sense of the term. Honest seed corn breeders eventually triumphed, as is usually the case in every progressive achievement of science in all fields of human endeavor.

Any intimation that citrus fruit growers will be universally misled by dishonest practices by unreliable persons is in fact a direct insult to the intelligence and a reflection on the ability and judgment of our citrus growers as a whole.

Performance Records

There are two kinds of citrus performance records in use, one the scientific and detailed records for the purpose of study, and the other the practical records used in orchard management. In the scientific work, the forms for record keeping have been worked out with great care for each variety and have been modified and improved as our knowledge of the subject developed. It is not practicable to present the many record forms now used for this purpose in this paper. Anyone who wishes to secure copies of these forms can do so by correspondence with the writer at Riverside, California.

The practical citrus performance record forms are based on the facts of the amount of individual tree production and notes on the commercial quality of this product. The experience of citrus growers who have adopted citrus performance record work and who have used it for one or more years justifies a recommendation for the general introduction of individual tree records. The selection of any particular method or methods will depend upon circumstances. In any event the method selected should be carefully considered, preference being given to the adoption of a method which has been tried out successfully.

Tree Numbers

A comprehensive method of individual numbering is absolutely essential to successful performance record work and individual tree study. The method used in our performance record work is as follows: Each tree is given a number consisting of the number of the plot, the number of the row in which the tree occurs, and the number of the tree in the row, always counting from a fixed starting point, as for instance the point nearest the source of irrigation water. The number of a tree located in plot 3, row 14 and tree 17 in the row would be 3-14-17. The number is painted on the tree trunk with pure white lead paint after the dust has been brushed off the bark where the paint is to be applied. The arrangement of the numbers can be suited to tree conditions, as for instance in small nursery trees they can be arranged vertically, a single number in a place, in regular order down the trunk. Usually we have painted the number with a small camels hair brush, always at comparatively the same position on all trees. The numbers should be clear-cut, plain and unmistakable. One man can number an average of 300 trees daily. Our numbers, five years old, are as plain today as at the beginning.

It has been found that the use of this numbering system is of great advantage to the growers, entirely aside from performance record work, as for instance in the fumigation of particular trees, pruning and individual tree care in many respects.

(To be continued)

RIPE ORANGES

More definite information is being given to orange growers this year regarding the requirements, or rather the suggestions, by the department of agriculture as to what constitutes a ripe orange. We have received from Secretary F. O. Wallschlaeger of the Citrus Protective League the following announcement from the bureau of chemistry of the United States department of agriculture, through Mr. Benj. R. Hart, chief of the western district:

"The bureau of chemistry has received repeated requests to define the terms immature and maturity as used in Food Inspection Decision 133, relating to the coloring of green citrus fruits. Such a definition seems desirable in view of the uncertainty now existing regarding the scope of this decision. As a result of the investigations carried out during the season 1913 and 1914, the bureau of chemistry considers California oranges to be immature if the juice does not contain soluble solids equal to or in excess of eight parts to every part of acid contained in the juice, the acidity of the juice to be calculated as citric acid without water of crystallization. Owing to the fact that opportunity has been given to study the composition of California oranges during one season only the ratio set at this time is lower than that which is believed to be the minimum for properly matured fruit. It may therefore be expected that the requirements will be made more strict after data from several crops are available."

Decision 133 referred to above is as follows:

"The attention of the board of food and drug inspection has been directed to the shipment in interstate commerce of green, immature citrus fruits, particularly oranges, which have been artificially colored by holding in a warm, moist atmosphere for a short period of time after removal from the tree. Evidence is adduced showing that such oranges do not change in sugar or acid content after removal from the tree. Evidence further shows that the same oranges remaining on the tree increase markedly in sugar content and decrease in acid content. Further, there is evidence to show that the consumption of such immature oranges, especially by children, is apt to be attended by serious disturbances of the digestive system.

"Under the food and drugs act of June 30, 1906, an article of food is adulterated, 'if it is mixed, colored, powdered, coated, or stained in a manner whereby damage or inferiority is concealed.' It is the opinion of the board that oranges treated as mentioned above are colored in a manner whereby inferiority is concealed, and are, therefore, adulterated.

"The board recognizes the fact that certain varieties of oranges attain maturity as to size, sweetness, and acidity before the color changes from green to yellow, and this decision is not intended to interfere with the marketing of such oranges."

Homes fail as business houses fail, because of inefficient management. But inefficient management, it is safe to say, is most often the result of a lack of a single purpose, a clearly defined ideal or differing ideals.—Thomas Dreier.

The Panama Canal and The California Fruit Grower.

P-A-N-A-M-A C-A-N-A-L spells, to most people, merely Panama Canal, but to the California Fruit Grower it spells OPPORTUNITY, for fruit can now be shipped, via the Canal, to the Atlantic Seaboard, at

MANURING YOUNG ORCHARD TREES

Written for California Cultivator
By Sacramento Valley Contributor

FREQUENT inquiry is being made by those who have young orchards in the Sacramento Valley about manuring them. They want to know if stable manure should be placed around the trees, if so, how much and in what way, and what condition the manure should be in, whether fresh and strawy as it comes direct from the stable, or well rotted.

Then there are some others who have recently come to the country from the East who say, "We have bought land here on the representation that it is very rich in the elements of plant food and that chemical analyses show that it will require decades of heavy cropping to deplete the soil. Why should barnyard manure or any other fertilizer be necessary?"

A good general answer to this use of barnyard manure question is to put it on the land at any time and in any condition, as long as the land is not so wet that it will be injured by stock and wagon puddling or compacting the soil, providing large piles are not put closely around the tree so that fermentation would injure the bark.

How much? We assume that few will find it possible to get too much at reasonable cost in labor or money. We would start in by putting a layer four or six inches deep for a distance of from five to ten feet around the tree, leaving a circle of a foot or so close around the tree with a thin layer of an inch or two. If you have more than this widen the circle until the whole area is covered. On heavy land, into which water penetrates slowly so that there is little danger of much loss of fertility by percolation a good time for this application is now before the heavy rains. These rains and the weathering of the winter will help to incorporate the manure into the soil.

What kind of manure for our heavy lands? Any kind, from straw to ten-year-old sheep manure. All will help to open up the soil, make it more porous, open, and granular in texture and of better physical or mechanical condition. This is the thing it needs more than the chemical elements of fertility added by the manure. If you have strawy, fresh horse manure get it away from the buildings where it will breed flies and lose valuable plant food through the processes of decomposition and put it on the land. For special hothouse or truck crops it might be all right to compost and rot it but it will be better for the average new settler who has a young orchard on fairly heavy land to apply it to the soil as soon after the manure is made as possible. At the Monroeville orchard of the Sacramento Valley Irrigation Company, at St. John in Glenn County, the manure from the mule barn is hauled out and spread around the trees every day in the year.

Diversified farming means livestock and fruit and other crops and that means manure for the land and a permanent agriculture.

THE CHRYSOPA OR APHIS LION

A correspondent at Yuma, Arizona, recently sent specimens of aphis infested cotton leaves to the entomologist of the station, Dr. A. W. Morrill of Phoenix, who in his reply, gives the following interesting information concerning a beneficial insect known as the "aphis lion."

Among the infested leaves I find two specimens of lady bugs, one the adult and one the larval form. There is also a specimen of the larva of an aphis lion. This is about one-quarter of an inch long, pale yellow in color marked with brown. It is rather thick in the middle and tapering toward both ends. Its head is provided with long curved jaws or mandibles, which are used to hold the insect prey while feeding. These little insects eat a great many plant lice during their larval stage, and when full grown spin a white, almost spherical cocoon, in which transformation to the adult takes place. The adult insect is greenish in color with long delicate wings which come together in a roof-like manner over the body. When handled it gives off a disagreeable pungent odor which is difficult to remove from the fingers even with the aid of soap and water. The adult lays a number of eggs which it attaches to the plant—usually to the under side of the leaf. These eggs may be laid singly or in groups. They are always attached with a slender stalk about half an inch in length. As each egg hatches the young goes down the egg stalk and crawls around in search of food. It will eat anything of the nature of an insect, but as the mother insect has always invariably taken care to select an aphis infested leaf or plant, the bulk of the food consists of aphids. To return to the matter of egg stalks, it is interesting to note that this is a provision of nature, since it is quite likely that if the eggs were all attached to the leaf direct the first young aphis lion to hatch would make its first meal on its unhatched brothers and sisters.—Southwest Stockman.

CONTROL OF PLANT LICE

Since aphides, commonly called "plant lice," are sucking insects they are to be controlled by a contact spray of some sort. For this purpose kerosene emulsion, common soap solution, whale oil soap solution, or tobacco extracts may be used.

Kerosene emulsion, diluted one part to ten with water, is effective but so often is not properly made and injury is apt to result to the foliage.

Common soap solution may be made by dissolving laundry soap in water at the rate of one pound of soap to four or five gallons of water.

Whale oil soap solution—the potash soap being the best—is made by dissolving one pound of soap in five or six gallons of water. Some kinds may be used even one pound to eight gallons.

Tobacco extracts may be home-made or of the commercial preparation. Small amounts may be made for use by steeping one pound of tobacco leaves in four or five gallons of water. For extensive spraying, or if the material can be obtained near-by, the commercial tobacco extract is excellent. It contains 40 per cent of nicotine sulphate and for plant lice requires dilution with water at the rate of three-fourths pint to one pint of the extract to 100 gallons of water. Three or four pounds of soap are added to this amount to increase the sticking qualities.

Any of the above sprays should be applied thoroughly, care being taken to get the spray into any of the curled leaves and onto the aphides so as to wet them thoroughly. The manner of application of the spray will depend upon the size of the plant to be sprayed and upon the nature of the plant, whether tree, vine, low crops of the garden, flowering plants or house plants.—D. E. Merrill, New Mexico Station Entomologist.

PHYTOPATHOLOGICAL SOCIETY

A meeting of the Western American Phytopathological Society is to be held at Corvallis, Oregon, December 28-30. This meeting will be planned primarily for the benefit of technical plant pathologists so that they may get together to discuss problems of particular interest in the western area of the United States and Canada. The practical problems connected with control of plant diseases, however, will also be considered by the meeting, so that it should be of interest not only to technical men but also to practical growers who are interested in making a careful study of problems which they have. Plant pathologists and persons who are interested are cordially invited to attend this meeting.—Wm. T. Horne, secretary-treasurer.

APPLE RECIPES

The International Apple Shippers' Association of Baltimore, Maryland, of which U. Grant Border is chief booster, is mailing 197 delicious, health-giving apple recipes, each tested by an expert. The compilers of the book seem to look at the question somewhat one-sidedly in that they scarcely refer to Pacific Coast apples, but there are a vast number of very valuable recipes and facts given in the book.

Bumper crops without market facilities have sent more farmers staggering down the back alleys of agriculture than all the pests and drouths that ever cursed the nation.

Agriculture needs all the great men it can get.

TULARE COUNTY
LAND
FOR RENT

Any part of three sections good, productive land with water, between Pixley and Spa. Only three miles from two railroads. All plowed and harrowed, ready for seeding. Heavily manured. Has been fallowed every year. Used several years as stock ranch. If seeded now to grain or sugar beets, should yield heavy crops. Will rent on crop basis or otherwise.

R. C. FAIRALL
Pixley, Cal. Tulare County
or
R. SCHIFFMAN

Reviews of New Books

SOILS

Soils, Their Properties, Improvement, Management, and the Problems of Crop Growing and Crop Feeding, by Charles William Burkett, Director of the Agricultural Experiment Station, Kansas State Agricultural College, published by Orange Judd Company, New York, price $1.25. The Cultivator will be glad to secure the book for its subscribers at the above price or, including a year's subscription to the Cultivator, at $2.10.

The book has 300 pages filled with practical matter pertaining to management and improvement of soils. There are many half tones and line engravings, some of them full pages, some smaller insets. From the introduction we quote:

"The soil: the clothing of the earth.—The real clothing of the earth is the soil—and we are to study it: the good, kind soil that brings us so many useful and beautiful and wholesome things. For with the soil is the real beginning of all material things, of all useful things; of all things that secure contentment; of all things that lead to comfort and happiness; of all things that have to do with food and raiment and shelter; of all things that advance mankind and promote civilization. All of these things spring from the soil—from the simple, inanimate material thing we call dirt.

"The earth's clothing includes the soil in all its variations, includes the dirt in which plants root and feed and grow; includes the rock and stony structures of sea and mountain; includes the waters of the soil and of the deep; includes the minerals in the mines that man seeks, often losing his life in the search; includes the insect, the worm, the bacterium, and every form of life that labors for its usefulness and grandeur; includes the fruits of field and soil—the life that grows therein and makes food for man and beast; includes the tree that grows and fructifies in forest or orchard; includes the cultivated crop of every variety and species, of every form and description; includes every vegetable type that provides raiment or covering in the open, or when removed from its place of growth becomes house and shelter that protects and guards and comforts; includes everything that has use and that supplies a want in every part of the world and for every purpose."

There are 30 chapters, and amongst the many topics pertaining to soils which are touched upon are, soil makers, the soils that living things have made, what we find in soils, getting acquainted with plant food, the role that tillage plays, the release of soil nitrogen; the return to the air, nitrification; nitrogen made ready for plants, stable manure, its composition and its preservation, handling manure on the farm, buying plant food for the soil, using chemical manures intelligently, the old worn-out soils: what we may do for them.

PRACTICAL ORCHARDING

Practical Orcharding on Rough Lands, by Shepard Wells Moore, published by The New Werner Company, Akron, Ohio. The Cultivator will be glad to secure the book for its subscribers.

The book contains nearly 300 pages of popularly written material touching upon orcharding in general and giving much practical information as to soils, keeping up fertility, etc. There are 14 chapters touching upon essentials, orcharding as a business, location, preparation, selection of stock, planting and cultivation, in fact, general information as to orcharding.

"This is an age of advancement. As a people we are proud of our achievements. With eager watchful eye we note the ever varying customs of those about us, even the fashions that come and go with each recurring season as so many fast flying shuttles. Each shuttle carries its own thread of special hue and cannot fail to leave its trace in both warp and woof of the nation's fabric."

ALFALFA IN ORCHARDS

A Colorado grower says: "The most serious objection to alfalfa in an orchard in our western states is due to the fact that alfalfa affords ideal food conditions for the rapid increase of grasshoppers in the orchard which are apt to injure the fruit or foliage."

PEACH TREE BORER

This is a pest of peach growers all over the country. The larvae live between the bark and wood a little below the surface of the ground in a mass of gum and woody material. It is a soft whitish caterpillar with a reddish-brown head. The egg from which this hatches is laid on the trunk of the tree at or near the surface of the ground by a handsome day flying moth. The larvae after hatching eat through into the inner bark and sapwood of trunk or large roots, upon which they feed, causing a gummy exudation. They feed in this way for about a year, often almost girdling a large root of the tree.

When the larvae are full grown they construct cocoons of the gummy exudation, their casting and silk, about an inch below the surface of the ground where about three or four weeks later they change to moths. Although there is but one generation in a season, the moths are present most of the summer. The larvae reach maturity at different times, thus keeping up almost a constant supply of adults.

The most satisfactory method of control has been to go over the trees and dig out all the larvae once in the spring and again in early fall. Their presence is easily detected by the gummy exudation on the crown and large roots.—Geo. M. List, Colorado Agriculture College.

Get Started Right This Season

The one best way is to have every order directed to the

FANCHER CREEK NURSERIES

WE guarantee all nursery stock sold by us to be "True to Name," and you can depend upon your order being filled with best quality trees and shipped in "A 1" condition. We have the largest and best stock of trees on the Coast. Our 30 years' experience, immense nurseries and close touch with conditions enable us to know and grow what is best suited for the Coast counties, valleys and foothill regions.

The demand for high-grade nursery stock so far this season is unprecedented, and to avoid disappointment we advise that you write us at once what your probable requirements will be.

ROEDING TRUE TREES FRESNO, CAL.

No matter how large or how small a quantity of trees or vines you may be figuring on setting out this season, you will do well to get in touch with us at once and get our prices and suggestions.

Write Us Today

Send us your list for prices. We will gladly advise with you free of charge and without any obligation on your part.

CALIMYRNA FIGS

Our New 1914 --- 1915 Illustrated Price Catalog WILL SOON BE READY

If you wish a copy, send us your name and address now and we will see that it is mailed to you as soon as it comes off the press. It will briefly describe and price all the stock grown by us, comprising over 2000 varieties of fruit and ornamental trees, plants, vines, etc.

This is the celebrated Smyrna Fig of Commerce—introduced and grown by us successfully. It is undoubtedly the only fig to plant for shipping, table and drying. Write us for further information. We also have a good stock of the Adriatic types.

Get More Pull at the Draw Bar Without Packing the Soil

HERE'S the tractor that you can drive over any soil that is fit to be worked. It lays its own track and rides on steel rails. It creeps over wet, soft or loose ground where round wheel tractors would be useless.

The "Creeping Grip" Tractor

never packs the soil. The long, wide track distributes the ground pressure over a large area which minimizes the weight per square inch.

The rear of the machine rests upon a pivot in the center of the creepers. Thus the creeper bands mount and oscillate gently over ridges, back furrows, dikes and ditches. They avoid the jolts and jars that would rack other tractors to pieces. The power plant is kept free from vibration—the upkeep cost is reduced to a minimum.

The "Creeping Grip" tractor gives you maximum power at the draw bar. No power is lost in slippage. This is because the extra large bearing surface sits flat on the ground with a firm grip. You save the power that round wheel tractors lose through slipping and digging into the soil.

Here is the practical tractor for pulling your plows, harrows, drills, seeders and similar machinery. It will do your work for less cost per acre than any tractor that we know of. It will travel and pull a load over any ground that would support a horse. You can have a "Creeping Grip" out working on soft ground in early Spring when ordinary tractors must lie idle.

Write for Catalog and Demonstration on Your Farm

Only the highest quality materials go into this tractor; only the most skilled workmanship is employed to build it. It is backed by 35 years of successful manufacturing experience. We give every buyer an individual guarantee.

Tell us how many acres you operate and we will arrange for a demonstration on your farm. *Write us today* for literature.

THE BULLOCK TRACTOR CO.
1814 Diversey Parkway Chicago, Illinois

The Baby "Creeping Grip" $950

Farm Bureau

DIRECTOR B. H. Crocheron writes:

"Solano County has successfully formed its farm bureau and passed its appropriation for a farm adviser, so that I will request the board of regents to make the appointment at an early date. Glenn County has also passed its appropriation for a farm adviser and is forming its farm bureau with the expectation that it will soon reach a successful membership so that we will be able to appoint a farm adviser this year.

"With these appointments our funds will be exhausted, so that no more appointments are likely to occur until July first, next. Several counties are on the waiting list, hoping for appointments the next fiscal year. The first of these will be Stanislaus County which has passed its appropriation and is proceeding to form its farm bureau. Numerous other counties are agitating the matter. Among these are Placer, Mendocino, Del Norte, Fresno, Tulare, Los Angeles, Monterey and others."

We give the following schedules of meetings of the different farm bureau centers for December.

Kern County, R. R. Mack, Adviser.

Delano, December 2, 8:00 p.m., R. H. Hiett, director; McFarland, December 4, 8:00 p.m., H. L. Heard, director; Wasco, December 7, 8:00 p.m., Prof. W. T. Fowler,, director; Rosedale, December 9, 8:00 p.m., J. Waters, director; Rio Bravo, December 12, 8:00 p.m., F. W. Haag, director; Panama, December 14, 8:00 p.m., A. B. Robinson, director; Muroc, December 16, 8:00 p.m., C. E. Clark, director; Willow Springs, December 17, 2:00 p.m., H. W. Mongold, director; Tehachapi, December 21, 8:00 p.m., L. T. Jenkins, director; Arvin, December 28, 7:30 p.m., R. Haven, director.

Ventura County, William B. Parker, Adviser.

Mound, December 1; Ventura Avenue, December 4; Fillmore, December 7; Oxnard, December 9; Camarillo, December 11; Nordhoff, December 14; Saticoy, December 16; Moorpark, December 17; Somis, December 21; Santa Paula, December 29.

San Diego County, Jas. A. Armstrong, Adviser.

Encinitas, Monday, December 7; Vista, Wednesday, December 2; Fallbrook, Friday, December 4; Escondido, Monday, December, 14; Julian, Wednesday, December 9; Dehesa, Friday, December 11; Lemon Grove, Monday, December 21; El Cajon, Wednesday, December 16; Jamul, Friday, December 18; Chula Vista, Monday, December 28; San Ysidro, Wednesday, December 23; Poway, Friday, December 25; Campo and Boulevard, Wednesday, December 30.

Directors Meeting.—The regular monthly meeting of the directors of the San Diego County farm bureau will be held at El Cajon at 10:30 a.m., December 5. Among other matters of business will be first, a further report from the marketing committee, second, the naming of a committee on arrangements for the annual meeting in February, third, the appointment of a nominating committee for new officers for the next year, fourth, the extent of membership rights to members joining after November 15.—H. A. Weinland, secretary-treasurer.

J. A. Prizer, entomologist for San Diego Fruit Company, has carried on extensive investigation on gum disease of lemons, under the direction of Prof. H. S. Fawcett of the Riverside Experiment Station. He has proven that it is contagious, that it may be cured and what's more important, it can be largely prevented by painting trunks of trees with Bordeaux paste.

SOME CAUSES OF NOISY OPERATION

Probably one of the best books yet put out on the constructon, operation, maintenance and repair of the automobile is The Modern Gasoline Automobile, by Page, published by the Norman W. Henley Company of New York. From its 700 pages of well written material as to the maintenance and care of the machine, which is becoming so popular, we take the following regarding some causes of noisy operation:

There are a number of power plant derangements which give positive indication because of noisy operation. Any knocking or rattling sounds are usually produced by wear in connecting rods or main bearings of the engine, though sometimes a sharp metallic knock, which is very much the same as that produced by a loose bearing, is due to carbon deposits in the cylinder heads, or premature ignition due to advanced spark-time lever. Squeaking sounds invariably indicate dry bearings, and whenever such a sound is heard it should be immediately located and oil applied to the parts thus denoting their dry condition. Whistling or blowing sounds are produced by leaks, either in the engine itself or in the gas manifolds. A sharp whistle denotes the escape of gas under pressure and is usually caused by a defective packing or gasket that seals a portion of the combustion chamber or that is used for a joint as the exhaust manifold. A blowing sound indicates a leaky packing in crank case. Grinding noises in the motor are usually caused by the timing gears and will obtain if these gears are dry or if they have become worn. Whenever a loud knocking sound is heard careful inspection should be made to locate the cause of the trouble. Much harm may be done in a few minutes if the engine is run with loose connecting rods or bearings that would be prevented by taking up the wear or looseness between the parts by some means of adjustment.

As a general rule the average motorist is not sufficiently informed mechanically to undertake repairs of worn motor parts, and whenever repairs of a mechanical nature are necessary it will be much more satisfactory and cheaper to have them done by experienced mechanics or repairmen. Ordinary adjustments may be attempted by even the inexpert, but it should be remembered that nothing may be changed without a good reason existing for making the alteration. It is well for the motorist to be familiar with the common derangements which may result in irregular engine operation or loss of power.

It is well to remember that common troubles can only be located by systematic search and that causes of imperfect engine action are often located by those who do not recognize the symptoms because they follow a logical process of elimination.

Bees and Their Care

BEE DISEASE GERMS DESTROYED BY HEAT

HOW much heat is necessary to destroy the germs that produce disease among bees? This question has been asked by many bee keepers who, although they know how heat is employed to reduce their losses from disease, do not know exactly at what temperatures to use it for different diseases. The question is now answered by the United States department of agriculture, which has been conducting experiments for two years to obtain the information.

Honey is often heated to destroy the germs of infectious bee diseases, and similar heat is also used in the rendering of wax and in the making of comb foundations. The direct flame applied to the inside of the hives that have had infected colonies in them has also been used in the control of these diseases. Those who handle honey commercially will be interested to know that when honey is heated to a temperature of 160 degrees Fahrenheit the germs of three of the four infectious diseases of bees that give trouble to bee keepers are destroyed.

There are four bee diseases now known to be infectious, the germs of which may be destroyed by applying heat of certain temperatures for 10 minutes. These diseases are European foul brood, American foul brood, sacbrood, and Nosema disease. The minimum temperatures at which heat will destroy these diseases respectively are as follows:

Name—	Minimum temperature Lies somewhere between Deg. F.	Being approximately Deg. F.
European foul brood	140-149	146
American foul brood	194-212	208
Sacbrood	131-140	137
Nosema disease	131-140	135

In practice the bee keeper in destroying these germs will naturally use a quantity of heat somewhat in excess of the minimum amount that is absolutely necessary.

The melting point of beeswax is between 143 degrees and 148 degrees, Fahrenheit, and this temperature will destroy the germ of the European foul brood in 10 minutes. It is about 10 degrees Fahrenheit above that which will destroy sacbrood and Nosema disease. Therefore, when wax is kept in a melted state for about 10 minutes there is a certainty that three of the four dangerous diseases are destroyed.

Different Manifestations of Disease.

The name "foul brood" was used nearly a century and a half ago to describe disorder of bees attacking the brood of bees, and for a long time any similar destructive disease was called by that name. About half a century ago bee keepers began to notice that all brood diseases are not the same. At present three distinct infectious bee diseases are known that attack the brood only: European foul brood, American foul brood and sacbrood. European foul brood causes the larvae to die early and is not accompanied by the pronounced odor which enables bee keepers to detect American foul brood. In the former case the larvae usually die before the cells containing them are capped; in the latter they usually die after the cells are capped. In the latter disease the decaying larvae show a marked viscidity (ropiness), which is absent in the former.

The disease "sacbrood" received its name from the saclike appearance of the dead larvae when they are removed from the cell. This is the most characteristic symptom of the disease which almost invariably causes the affected larvae to die after the cell is capped.

Diseased in the Spring.

In the spring of the year many bees, especially those of weak colonies, show upon examination a high percentage affected with Nosema disease, a disease that attacks adult bees only. From 50 to 90 per cent of the bees of a weak colony are sometimes infected with the parasite Nosema apis that causes this disease. The bee's stomach is the organ affected. Many colonies that are strong and apparently doing well are found to contain some bees infected with this parasite.

A new bulletin of the department (No. 92), "Destruction of Germs of Infectious Bee Diseases by Heating," contains details of the results of experiments that have been made on this bee problem. Although considerable work must still be done before methods can be recommended, still the results of experiments to date will give bee keepers practical data that may aid them in reducing their losses, and bee keepers who have found these infectious diseases troublesome are invited to apply to Washington for the bulletin, which will be sent free of charge.

Kirkman Nurseries
RELIABLE TREES AND VINES

We again solicit the fruit tree and vine orders of the planters of the West, knowing that nothing but the Best will satisfy the experienced buyer. Twenty-eight years of successful nursery business has proven the quality of

KIRKMAN TREES

and the treatment Kirkman accords his customers. Our steadily growing patronage has demanded that we grow more stock each year, until we now have more than five million trees and vines growing in our nursery plants in California and Arizona. A considerable portion of the stock in our nurseries, which will be ready for delivery this coming winter and spring, is already sold to early customers, but we still have a complete stock of all varieties of fruit trees and vines, as well as a general assortment of ORNAMENTAL and SHADE trees, etc., etc. What are you going to plant? We have it, without doubt, in large or small quantities. Illustrated price catalog on application. Please mention what varieties you are expecting to use.

KIRKMAN NURSERIES 2525 Tulare Street, Fresno, Cal.

The Lawn and Flower Garden

THIS MONTH IN SOUTHERN CALIFORNIA

Written for California Cultivator
By O. M. Morris

THERE is yet time to plant winter flowering bulbs, though they should be gotten in as soon as possible. Of the summer flowering types gladioli and tuberoses may be planted this month. Such varieties as begonias, dahlias and cyclamen will succeed better if planted in March or April, but the so-called winter flowering bulbs should be planted as quickly as possible.

Seed of phlox, stocks, centaurias, scabiosa, coreopsis, mignonette and candytuft, which are all quite hardy, may be planted during December for early spring blooming.

Through the efforts of the 1915 City Beautiful Committee (Los Angeles) in offering valuable prizes for best results obtained in certain plats of land much interest is being manifested among school children and home garden planters; in fact, the younger planters are evincing more interest than ever before, and no doubt the experience obtained will prove of great benefit. The county is expending more than $25,000 for prizes and seeds. This work is under the supervision of Mr. C. L. Schufeldt, 419 South Hill street, Los Angeles, who, with a corps of assistants, is getting matters in shape toward the making of the "City Beautiful" for 1915. Those interested in this work will do well to consult Mr. Schufeldt.

GARDEN HARMONY

Written for California Cultivator
By Ernest Braunton

THE chief requisite of a garden is harmony. While in general it should harmonize with its surroundings, it is still more essential that each part of it should harmonize with all other parts. Refinement should also be in evidence throughout this perfect accord.

If one part of the garden should be given over to other uses or other style or styles than the main part there should be a division by hedge, wall or fence so that one part is not so plainly shown from the other as to enable comparison of the two from any point of view. This may sound a little technical, but if for but a moment considered the suggestion is a simple one simply expressed and the reason therefore apparent to all.

The fact that I am English may be the cause of a strong leaning toward privacy, which is the keynote of all English gardens. Recently garden prizes were offered in England for the best designs and two American women were among the winners. In criticising the American design standing highest, winning third prize, the judges stated the back yard was insufficiently screened by shrubbery and it was feared that neighbors might be offended by a too open view of drying clothes. Speed the day when we will so plan in America as to consider even the minor points of possible objection from our neighbors.

As a rule all plants thrive better with some shelter so that seclusion really brings better results in gardening. No plant or collection of plants shows so well in the open as in some secluded and therefore perfectly natural setting. A protected garden always holds something in reserve for the visitor, for it cannot all be seen at a glance. There is always a pleasure in the experience of discovery. Much of the charm of a garden may be produced by a fitting entrance, yet why an entrance to a garden that is "open?" How may a path "lead" to a garden when all may be seen before arrival at the entrance? Let us have gardens that we may really enter and not of that vulgar type that stick up and out like a cameo setting on a finger ring. Then, when properly planted we shall have harmony both materially and spiritually.

WEEPING WILLOW OF GRACEFUL DROOPING HABIT.

Desert Giants

It has long been thought that of desert plants not strictly trees the giant cactus, Cereus giganteus, of Arizona and northern Mexico was the largest. But recently I have received photographs and measurements of a tree yucca (Yucca arborescens) of the Mohave desert, known locally as the Joshua tree, that surpasses both in height and girth any giant cactus known. This desert sentinel is a much- branched tree 65 feet high and 23 feet around at one foot above the soil. When it is considered that the substance of yuccas is not really wood and therefore not a tree proper we may once more proclaim that "California has the biggest," etc., etc.

Changing Plant Sex

Someone asks me if plant sex may really be changed. Such changes are occasionally brought about in plants that bear the two sexes of its flowers on different plants. Cases are known in northern Africa where there has been an excess of male date palms; the natives pull out the first flower spike in the hope that the next one will prove female, and they are not always disappointed. The second, and all subsequent flower-spikes, bear nothing but female blossoms and of course bear a resultant crop of dates. This change is infrequent however and therefore not to be depended upon for control of date orchards. The tropical papaya or paw-paw is more often changed by the same method or by cutting off the whole top of male plants. Such changes are well-authenticated, having been vouched for by plant experts employed by Uncle Sam.

Stir the Soil

It seems rather odd to visit a strictly rural garden and find the plants suffering through a lack of soil stirring, yet I have found such cases. One would think that on up-to-date ranches where soil practices are on a high plane that experience would dictate garden methods, yet I have found gardens in the midst of splendid citrus orchards that were suffering through need of just such treatment as had for years been given surrounding orchards. Too many of the gardens lack in soil stirring. While the orchard is plowed and cultivated deeply, the garden is often hard from continual trampling. Again, lime the soil but do not fertilize at same time or until 60 days thereafter. Neither lime after fertilizing for six months.

Plant Bulbs Now

Do not longer delay the planting of all sorts of bulbs, except dahlias, elephants ears, cannas and those things known to be of tropical nativity. Leave such until March or, if the season be late, until April. But all the common run of bulbs may go into the soil now. Tigridias should be reserved for March and gladioli planted any time from now to June. I believe best results come for gladioli growers when they plant in January and February. It was so proven this year, at least, though seasons may differ in this respect.

Sow Seeds Shallow

Now that cold wet weather is with us do not cover garden seeds too deeply, either flowers or vegetables. So many seeds are small and their germination weak except under most favorable circumstances, and these usually are warm, moist soils. With us at this season soils are generally too wet and too cold for the finer seeds. Unless hot dry spells of weather come, and these are not now expected, there is little danger of non-germination through lack of sufficient covering.

Plant Tropical Fruits

I would not advise anyone to plant

Small Fruits Vegetables

THIS MONTH IN SOUTHERN CALIFORNIA

Written for California Cultivator
By O. M. Morris

WHILE it is a little cold this month for any great amount of planting the following list of vegetables will be found hardy: Broad Windsor beans, turnips, beets, Brussels sprouts, cabbage and cauliflower, carrots, endive, chard, lettuce, onion sets and seed, radish, spinach, leek, Georgia collards, kale and mustard.

Plants of strawberries, rhubarb, horseradish, asparagus and chayotes may be put out. Best cultural method for the latter vegetable is to plant in six-inch pots or small boxes, putting seed end down, holding them in this shape for two or three months and transplanting to permanent quarters after the ground becomes somewhat warm. They require but very little moisture until after the growth is well started. Too much watering and planting too deep cause most of the failures. When planting the fruit should be left half uncovered, that is, the blossom end should be planted about one-half the depth of the fruit. Keep in a warm sheltered place and water very slightly until the growth is well started, when it may be given more sun and moisture.

THIS MONTH IN THE SACRAMENTO VALLEY

Written for California Cultivator
By S. S. Rogers

The planting calendar for the Sacramento Valley during the month of December includes only those vegetables which are partially resistant to frost. During this month only the hardiest vegetables should be grown in the open.

All root crops such as beets, carrots, turnips and so forth can be planted during this month with safety. In sections of the valley in which the frost is not too severe peas can also be planted, using the Telephone or Stratagem varieties. The seed for late spring cabbage should be planted this month, using the Early Flat Dutch variety.

Where the moisture conditions are favorable and where the weather is not too cool, potatoes can be planted. It is recommended only in certain very favorable localities to plant a large area to potatoes during this month, for there is a liability of the vines being seriously injured by frosts which will come during the next two months or so. If potatoes are to be planted this month, the Early Rose will be found a good variety. A few of the market gardeners plant the Democrat and Garnet Chili varieties, especially through the bay section.

It might be well to make another planting of cauliflower, although it is getting a little late in the season to plant this vegetable in many sections of the valley.

A very necessary adjunct to the vegetable garden is the hot bed, and as its use is a necessity in the garden, a few words about its construction and care would possibly be of interest at this time.

Construction of Hot Beds

There are several methods for making hot beds, influenced largely by the local conditions and uses to which they are to be put. The method given below is one which is in common use throughout the valley and is proving satisfactory.

In the construction of hot beds, the first thing to do is to dig a pit five or six feet wide, about two and one-half feet deep and long enough to accommodate the plants. As a rule a bed about 20 feet long will be found more convenient than a longer one, and under ordinary conditions it would be better to build three 20-foot beds in preference to one 60-foot bed. After the pit has been dug a board frame is put around it, having the south side six inches to one foot high and the north side two to three feet in height. The ends of the bed should be enclosed with boards and made as tight as possible.

About six inches of straw should be laid on the bottom of the pit and on the top of this should be put about two feet of stable manure, which should be tamped down firmly and watered. The following day the bed should be examined and if the heat is rather uneven the manure should be forked over and again tamped and re-wet. Earth should be put on top of the manure from a depth varying from six inches to one foot, depending somewhat upon the kind of vegetables which are to be grown.

The soil for this purpose should be of a sandy nature, and if it is not rich enough, a heavy coating of well rotted manure should be mixed with it. After the earth has been smoothed, the bed is allowed to remain in this condition a short time until it has cooled off sufficiently to plant the seeds.

In the eastern states where the weather is very cold it is absolutely necessary that the top of the beds be covered with glass sash. In California where the winters are mild the beds can be covered either by the glass sash or muslin, and as a rule the latter covering will be found satisfactory and is much cheaper than the glass. During warm days the top should be rolled back and put over the beds again during the nights and cold weather.

The heat can be kept in the bed much better if the outside is banked with earth, or preferably manure, and the beds should be in as warm a spot as can be found. Generally the south side of a barn, shed or house makes a very good location, providing water can be had conveniently.

The care of the plants in the beds will be taken up in a future issue of the California Cultivator.

CELERY CULTLRE IN CALIFORNIA

(Continued from page 547)

sowing varies from February to April inclusive. The soil to be used for the seed bed should be put in the finest possible condition, both as to tilth and freedom from weeds, having the ground moist up to the surface. The seed is sown broadcast in these beds, covered by the use of hand rakes and the water is generally applied by running it in the furrows between the beds. The plants are left in the beds from two to four months before pulling, the exact time depending upon the local conditions. If the plants are growing too rank it is often necessary to mow the tops off with a scythe. Hand weeding is generally necessary throughout the season in order to keep the weed growth down. Just before pulling, the weeds should be well watered and the plants dug up by the means of a trowel or shovel, placed in pans and hauled immediately into the field where they are transplanted.

Preparation of the Fields for the Young Plants

There is probably no other vegetable with the exception of the onion which requires such careful and thorough preparation of the soil as celery, and unless the preparation is such that the weed growth is killed, and there is present a fine mulch, the young plants will have difficulty in starting. The first step in the preparation of the soil should be deep plowing in the fall, allowing the land to remain rough during the winter months up to a month or two before planting in the spring. The first operation in the spring is to replow the soil, turning under all weed growth and working the soil down to as fine a condition as possible. If there is sufficient moisture present the weeds will quickly rot, and after this the soil should be re-worked by the use of a disk, spring-tooth harrow or cultivator until the seed bed is very fine and the weed growth has been entirely done away with. The cultivator or harrow should be used over the field often enough so that the soil will be in this condition at seed time. Just previous to planting, the field should be marked off and furrows plowed three and one-half feet apart and from four to six inches deep, the exact depth depending upon the size of the plants and condition of the soil, especially regarding moisture. The plants are lifted from the seed bed and brought to the fields in pans, and planted in these furrows as quickly as possible. They are generally placed about six inches apart, and a little deeper than when they were growing in the seed bed.

Cultivation

As soon as the plants have started, the cultivation should begin. At this time the cultivator should be regulated so that the earth between the rows of the plants is thoroughly stirred, although care should be taken not to throw the earth on the young plants. As the season advances and the plants are taller the earth can be stirred closer each time. After the plants have been in the field about three weeks to a month the field should be "crowded," moving the surface soil away from the plants; thereby killing the weed growth immediately around them. If the celery has not grown too tall, the ridges are worked down by the use of a large roller, but if the plants have grown so tall that they would be injured by this treatment, these ridges are smoothed by the use of the cultivator. After the plants have grown 12 to 15 inches in height, the field is "split," which means the earth from the middles is drawn around them. Care should be taken not to put the soil too high around the plants for fear of injury. The object of "splitting" is to gradually encourage the plants to grow tall and straight instead of spreading out. The plants should be "split" a second time, just before banking, which aids in blanching.

Banking

This is the last field operation performed with the exception of harvesting. It requires considerable skill in order that this be done properly. The object of banking celery is to encourage long straight stalks and aid the celery to bleach. The exact time that the celery is banked depends upon the season of the year and the soil. Celery growing on heavy lands will not keep as long in the bank as when growing in sandy soils. If the weather is hot or moist or if the celery is not sufficiently matured, it will soon spoil if allowed to remain too long in the bank.

Many of the growers bank their celery two or three times, throwing the earth a little higher each time until at the last banking the earth is placed as high as possible on the plant, leaving only the tips of the stalks showing. Practically all the celery in California is banked with earth, although in the smaller market gardens celery is sometimes tied up by hand and wrapped in sacks. Some of the market gardeners blanch their celery by use of boards.

Harvesting

The celery is harvested by cutting the roots just below the surface of the ground. This is done on a large scale by the use of a special machine which straddles the rows. Many of the smaller growers do this with a shovel, hoe or with other hand implements. After it has been so cut the outside stalks are pulled off and the celery is packed in crates and ready for shipment.

Varieties

There are several varieties of celery grown in this state, the Golden Self-Blanching is by far the most popular, especially for eastern shipments. The market gardeners often prefer the White Plume, Giant Pascal or the Green Top variety for the local markets.

Mermaid Spray Powder
FOR CITRUS AND DECIDUOUS FRUIT TREES
(Made in California)

ANALYSIS Curd Soap 50%, Bi-carbonate Soda 0.5%, Carbonate Soda 37.5%, Balance Moisture.

SOAP SPRAY An effective soap spray used in the proportion of one part of powder to six gallons of water with 200-pound pressure. Not harmful to trees or fruit if properly used.

Eradicates Scale

Mermaid Spray Powder will kill this form of pest when applied conscientiously with the above proportions at the right time. You will also note its effectiveness towards reducing red spider while spraying for scale.

COST A cheaper and purer soap powder that is prepared with accuracy.

UNIFORMITY Guaranteed to be at all times uniform and without lumps and to dissolve with absolutely no waste, thus saving time and money by not having your spray machine stopped to clean out impurities.

DELIVERY Promptness is our watchword. Any order placed with the Fruit Growers' Supply Company will receive immediate attention.

WRITE US TODAY

We will cheerfully give reference from Professional Sprayers and Growers throughout Southern California who have tried all other Powders and have found MERMAID SPRAY POWDER without an equal. If California can produce the goods—it is up to you. Investigate.

HOW TO INSURE A PAYING CROP OF SUGAR BEETS

Written for California Cultivator
By Percy L. Edwards

A FEW months ago there was a feeling among both the manufacturers and growers that next season's crop of sugar beets was an uncertain quantity. Following tariff changes a number of factories about the country closed their doors last season and others gave notice that after the present crop was cared for they too would likely suspend operations indefinitely. Farmers had come to realize that the sugar beet was one of their best paying crops and when, at the beginning of the contracting season last year, they were asked to grow the beets for a reduction in price they loyally agreed.

TRACTOR HANDLING THREE LOADS OF BEETS ON UP-TO-DATE DUMP.

War in Europe has brought about a radical change of conditions, and there is a great change of feeling among manufacturers and growers alike. The manufacturers, it is reported, are to go back to the old scale of prices to be paid for beets and with the present season's good returns from the beet fields, growers are enthusiastic for the future. The seed problem is working out satisfactorily and contracts are being renewed at this time and preparations made for the planting of next season's crop. From talk with manufacturers and growers the writer is able to say that the coming season will see every California beet sugar factory in operation and a much larger acreage of beets planted than ever before in the history of the industry on this coast.

The agricultural end of the industry is of special interest to the farmers of this state. Little attention has been given by the press generally to the agricultural work of the grower of sugar beets. Outside of agricultural journals, and but few of these offer the farmer aid in actual field operations, he receives but little advice and direction, except an occasional visit from the agriculturist representing a sugar company. This paper is intended as a help to farmers in selecting lands that shall produce the best results and in preparation of that land so as to insure what is called a "stand" of beets; that is the condition of the field when the young plants show above ground. Upon this showing of a good, or a poor "stand" depends the success or failure of the crop. If the stand is too irregular—too much space where no seed has germinated, the crop will not pay and the grower might as well know it at this time as to continue his expensive operations to the harvest time and then find it out. On the other hand, if the stand is well bunched and continuous, if properly handled, the crop is reasonably certain to be a paying one. It costs as much to produce a poor crop as it does to produce a good one. A good crop, as our observation leads us to assume at this stage of the beet culture in this country, should go 10 tons and over per acre.

There are many of the older growers of beets in this state who know how to select the fields for the beet crop. Indeed, there are many farmers known to the writer who have learned from experience a knowledge of beet culture equal in value to the information of any one. There are others who have not learned these lessons for different reasons; some are taking hold of the work for the first time.

The sandy loams found in the delta sections within the atmospheric influence of the ocean are the lands giving best assurance of good results at this time. Some of these lands, like those of Orange and Ventura Counties, run into a soil with a large proportion of clay. If these lands are so drained that water does not approach too near the surface, say three feet, these lands produce the best results. The writer has known fields of 100 and 200 acres go 20 and 28 tons to the acre. These lands are found within a few miles of the sea line. In the Los Alamitos country there is considerable of this land. Land within the influence of the sea's moisture laden currents are the most reliable for tonnage production and at the same time the sugar percentage is very satisfactory. No beet grower of many years experience needs to be told that in selecting fields that have for several years previously been used for corn or potatoes he is selecting the best land to prepare for his crop. This for two reasons; no farmer of any sense tries to raise a paying crop of corn or potatoes on any land but good land and crops like corn and potatoes are among the crops best cultivated. These reasons are good enough to be borne in mind by all who intend to raise sugar beets.

Grain lands are usually selected for sugar beet growing. Beets will rotate with grain very well. But while much of the so-called grain lands are highly productive, some are not. It is only the best that should be selected. When I say best, I mean only such lands as contain a fair amount of plant producing material. And do not make the mistake of believing that by heavy applications of manure at plowing time you can make this poor grain land yield a paying crop the first year. You will not get this result before the second season, especially if the manure is coarse with much straw. The other trouble with grain lands is that year after year they have been shallow plowed, and the soil that might produce the big crop has not been exposed to the chemical action of the atmosphere and therefore lacks vitality. For good results from these grain lands first used for sugar beet crops, the land should be plowed deep, say 14 to 18 inches, and the land permitted to lie just as left by the plow over the season. This land may be plowed in some sections after the harvest time and left over until the latter part of January and first of February. This is a good time for seeding sugar beets in Southern California, at least. In some sections planting begins as early as December.

In selecting land for beet growing where stubble is left at any considerable height, care must be taken to either plow it under deep enough to actually bury it or it should be removed from the field to prevent the obstruction to cultural operations. As the first cultural operation consists in driving a horse or team down through a field with rows of beets not over 18 or 20 inches apart and the beet plants barely an inch high, with a weeding cultivator, the necessity for having the field clean of obstructing material may be easily understood.

Above all do not select land for the beet crop that has a crop of obnoxious grass. You can not grow a paying crop on land that is befouled with Bermuda or Johnson grass. Do not listen to the man who says he has known a good crop of beets taken from a field covered with a growth of this grass. While it is true that there is compensation to the sugar beet grower who gets a poor crop of beets but who has by dint of hard work and considerable expense cleaned his land, it is a costly and unsatisfactory method of cropping. If you have not other available land for beet purposes, don't let anyone persuade you to grow beets. Wait until you have ready land that you are reasonably sure will produce a good crop of corn or potaoes, then seed this land to sugar beets. Finally, select the best land you have on the farm for the sugar beet crop.

Preparation of the Seed Bed

The experience of one who has planted and cultivated the sugar beet for the past 15 years and cared for the beet from seeding to harvest, followed it through the extraction of the sweet juices to the warehouse with its wonderful display of finished product, the lesson of most importance in preparing for growing a crop is thoroughness. Plow deep. If your land is not used to being plowed deep, then plow in the early fall and plow deep. Let the land lie through the winter until early spring if possible. O course you wish to get the advantage of the rains on your young crop. Some study of weather conditions will help you to determine how long to wait before seeding. If a crop of weeds is well started on the plowed field use the disk to chop them up. Heavy and thorough harrowing to pulverize the mold should follow. With land plowed early and left standing through the winter there is not apt to be any lumpy condition of the soil after the thorough disking and harrowing. But if there is a lumpy condition a roller should be run over the field and then a light harrowing follow. This harrowing should leave the surface smooth like a garden. If there is any amount of foul stuff on the surface it should be removed as it will impede the operation of the drill in seeding and obstruct the cultivator later on. Care should be taken not to plow when the land is not in fit condition, aspecially when the plowing precedes the planting closely. If the land is plowed lumpy the trouble to put it in proper shape is increased materially. It must be pulverized. I think that as a rule all fields plowed just before planting should be rolled and thoroughly pulverized before being subjected to a final light harrowing. If the soil is light in texture the seed may be planted without the harrowing. This condition makes the drilling in of the seed an easier and more even job when completed. The advisability of running the rows straight is understood by all who have had experience and will be apparent to anyone who has cultivated corn.

What is needed in this preparation of the soil for the beet seed is thoroughness more than anything else. After you think you have gone over your field with the harrow times enough, then go over it once more. In this way you are taking out insurance on your crop returns. In drilling in the seed be careful not to drill too deep. In a dry time you may drill in seed a little deeper, but as a rule one inch, or just enough soil to cover the seed, is sufficient. About 15 pounds to the acre is enough seed well planted. The drill will be set for rows 18 or 20 inches apart. Do not ride your drill, walk behind it and watch the feed closely. The feed sometimes clogs and you do not learn of your loss until it is too late. One other suggestion is to give the field a thorough wetting before plowing, if the season is dry, then it must stand until in good condition for plowing.

South African farmers are appealed to through Leaflet No. 13, 1914, of the Union department of agriculture in regard to the importance of selecting their corn for planting not from the crib or storehouse, as is usually done, but from the plant itself in the field. Ears should be selected, it is urged, from plants upright in growth, of normal size, with ears correctly placed, and the plants should not show susceptibility to rust, neither should there be any marked stooling habit. Ears should not be selected from near the sides or edges of the field, as these will be more liable to be crossed. The ears should be kept separate and should be stored away from the other ears to undergo a further selection, as time will permit, being selected for the various characteristics already enumerated.

In setting up any sort of machinery, big or little, see that it is level. Coal oil stoves have been known to fail because of not being level. If you have no level, pour water in a shallow pan

If in Doubt—
Plant Prune Trees

The demand for Prunes is constantly increasing and California must supply this demand. With a cheap water rate thru to the Eastern states, giving California growers control of this market, prune trees become

Staple Money-Makers

In the export market they compete successfully with European grown varieties.

Our parent trees of French, Imperial, Sugar and Robe de Sargent have been carefully selected from trees having the best record of QUALITY, PRODUCTIVENESS AND SIZE OF FRUIT.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

NOT SO DRY

As we go to press the first general coast storm is giving the much needed rain. The precipitation varies from an inch and a half to practically nothing in some sections. Predictions are for a continuance of the storm, and it is to be hoped that three or four inches will be secured before it ends. The most satisfactory feature of the storm is that in the citrus sections frost fighters were driven from the orchards by the rain. Warning was given from the weather office on Monday night to prepare for possible frosts on Tuesday morning, but before Tuesday morning the rain was falling. Many predictions have been made that we might expect a dry and cold winter; we trust this is promise of something better.

FOOT AND MOUTH RUMOR

Sensational reports were at one time circulated over the east in effect that one of the warring nations of Europe, anxious to prevent shipment of American meats to its enemies, had employed agents to visit certain sections of this country and inoculate livestock with the virus of the foot and mouth disease. The department of agriculture thought seriously enough of this rumor to trace it down, and it announces that it was simply a sensational dream of an irresponsible person at Lincoln, Nebraska. The fearful rapidity with which this disease spread before the quarantine was declared might give some little color to such a rumor, but it is unthinkable that any person could be secured to do such an act, which would be of so little benefit to anyone and of such immense damage to many.

AUTOS HELPING

Auto licenses brought to this country during the year 1913 over $8,000,000 which were used in road building. The total expenditure, however, for good roads in this country was something in excess of $200,000,000. In building of good roads we are glad to see California well up in the lead. As to our autos, they have done their share during the last year, that is, in a general way, though it is maintained that some machines have not paid in proportion to their usage. However, announcement is made that during 1915 licenses will be collected on a different basis, and machines which have during the past year paid five dollars will now be compelled to pay ten or even fifteen. It is estimated that next January the registration in this state will exceed 125,000.

PARCEL POST INCREASING

Before the installation of parcel post, anticipation of its great value ran so high that disappointment was felt by many because of its limitations. However, various changes have been made and a closer study has been made of the practical side, and its use and usefulness is materially increasing. Also various containers have been manufactured to aid in the shipping of produce. We believe that before many years an immense outlet for California's output will be secured through this feature of the postal service. California suffers a handicap in that practically all her parcel post operations are in the seventh zone and therefore she is obliged to pay the highest rate. But then many of our products are high-priced, and the long profits demanded by eastern retailers makes it necessary to study this feature of marketing. Extended investigation should be made so as to avoid the mistakes made by those who have been testing out the service.

TREES ALONG HIGHWAY

Michigan has inaugurated a movement to secure more general planting of fruit trees along the highways of that state. The supervisors of the various counties are appropriating thousands of dollars for the planting of these trees and different fruit growers' associations are aiding the movement. The plan is as yet in the making, for committees appointed are working on plans of utilizing the lands bordering the highways, both for beauty and for utility. One idea is that the beauty of the rural roads will be greatly increased, and more, that the revenue received from these fruit trees will aid in the upkeep of the roads.

We do not know that this plan would appeal to Californians, that is the utility side of it, though it must be confessed that there are some fruit trees like the olive and various nut trees and many other fruits which are most beautiful. The principal objection raised to the fruit trees is that their use would encourage marauders to take most of the fruit before their legitimate owners could get any advantages from it. Even if this were true, we don't see where the community is any the worse off than with purely ornamentals, provided the fruit or nuts are gathered without injury to the trees. The use of fruit trees is not so important, however, as that some kind of trees shall be planted in the parking along all country roads. One of our hardiest and most rapid growers, and, as it grows older, most beautiful trees, is the common blue gum. It has one serious drawback, however, and that is that its demand for nourishment and moisture make it encroach on adjoining lands.

PLANTING SUGAR BEETS

More general planting of sugar beet seed will be engaged in than was anticipated soon after the declaration of war. Practically every sugar beet section of California has received seed and will be worked to the limit. This is of course for the season of 1915. Announcement has been made that in the spring of 1916 the factories will nearly all close, but we trust that some arrangements will be made or that conditions will change so that all California's factories will operate.

The American people send abroad every year more than $100,000,000 to pay for sugar. It is time something was done to keep this vast sum of money at home. It would require millions of acres to produce that amount of sugar; those acres should be made productive.

STOP THE DREDGING

The total value of gold mines in California during 1913 was $20,406,958. Of this amount slightly over $8,000,000 was secured by gold dredging. Since the commencement of gold dredging in California 15 years ago the gold from this source has amounted to $63,505,485.

Probably some of this land had no agricultural value, but when the $8,000,000 is compared with some of our crops, for example, citrus fruits, and gold dredging is shown to bring to the state only about one-fourth as much as one year's citrus fruit returns, while the citrus fruit culture has only benefited the land and the dredging has destroyed it, the contrast is apparent.

Every session of the state legislature for many years has had presented to it a bill to control gold dredging. The aim is to stop the destruction of valuable agricultural lands, but each bill has been opposed by the powerful dredging interests so effectively that no measure has yet passed. Some of these lands are underlaid with thousands of dollars worth of placer gold, and when they can be bought for a few hundred dollars per acre the temptation is too great, and large companies have been formed and immense quantities of gold secured. Where these lands were in gravel beds or where it was not possible to grow orchards or other crops, there can be no objection to the dredging companies using them as they see fit. But for the sake of a profit of one year to destroy for all time productive lands is unwise as to our own interests as well as those of future generations. Some of these lands in Sacramento, Butte and other counties have been changed from productive acres to great boulder heaps. It was at one time claimed that these piles of boulders could be made productive at least to the extent of growing eucalyptus trees, but as all of the soil particles have been covered with from 30 to 50 feet of gravel and boulders of all sizes up to a ton, it is hard to imagine any eucalyptus or other tree growing there. It is asserted that while more expensive it is possible to return these lands to practically their original condition as the dredgers finish their work. If such procedure were followed there could be no objection, and the state would then be enriched by the gold secured and the ability of the land to produce golden crops to follow for all time to come, but as the law now remains the dredging and destruction of these valuable lands is increasing every year. It is time for our legislature to get busy.

Agricultural Notes

India raises about one-fourth of the cane sugar of the world's supply.

Business interests of Florida generally are donating funds for control of citrus canker.

Experiments are being made in Cuba in rice culture and some varieties have been grown very successfully.

Potato growers of Florida are organizing an exchange to buy supplies and market the product of members.

Cuban citrus growers are urging the government to establish a quarantine against diseased citrus plants, especially from southern United States, also to reduce duties on insecticides and fungicides.

Large plantings of Washington Navels and Valencias are being made in New South Wales. The growers will be able to place their fruit in the eastern ports of the United States in the middle of the summer season.

The Transvaal orange grower can ship midsummer oranges to Southampton, 7,000 miles, for a total cost of 39.5 cents per box, California size. These can be reshipped at the rate of 25 or 30 cents per box to New York harbor.

The citrus canker fighters of Dade County, Florida, are asking the nurserymen of the state not to make shipments of nursery stock into that section for the present. Some of the large nurseries have agreed not to make such shipments, even to fill orders.

Spanish orange growers are seeking in the United States an outlet for their fruit which cannot on account of war conditions be disposed of in Europe as formerly. Three commissioners appointed by the government left Cadiz on the last day of September and have been investigating market possibilities in New York, Boston and other centers.

Two refrigerator carloads of eggs have been successfully shipped from Iowa to New York city in cars fitted with a simple shock absorber recently patented. It is a disengaged floor and ends. The floor is on rollers so that it can move longitudinally about five inches. The shock absorber at the ends consists simply of coils of light wire placed between timber frames, the outer of which is secured to the end of the car.

The Onion Growers' Association of Antigua, British West Indies, is handling, packing, shipping and selling cooperatively a very large proportion of the onion crop of the island and has secured for the produce of Antigua a degree of recognition for uniformity and excellence in quality which is proving of very great service to the industry. It is in contemplation to extend this work with other vegetable products and fruits.

"The most recent news from the beet sugar district of Russia, including Poland," says "Sugar," is "that the effect of the war on the sugar factories has been very slight indeed, and the owners, it is averred, judging from present labor available, do not contemplate much, if any, difficulty in handling the average quantity of beet root that may come into their hands. If their judgment of the situation is correct, it may only be said that in respect to labor, both skilled and unskilled, the Russian sugar industry is particularly fortunate."

Agricultural News Notes of the Pacific Coast

Northern California

A great many blooded Berkshires have been sold from hog ranches of Yolo County.

Citrons and pie melons have been grown quite extensively the past year in Napa County.

The Amador-El Dorado Stockmen's Association held its annual meeting at Placerville last Saturday.

Placer County is taking steps to organize a farm bureau and, in fact, four units have already been organized.

The entomological station has been established at Placerville, its work being largely on the El Dorado national forest.

The creameries of Lassen and Modoc Counties are reported to be crowded to their limit in handling the output.

Butte County orange growers feel that the new ruling of the department regarding acid and sugar content of oranges is too rigid.

A tract of land near Oroville, comprising 780 acres, has been sold and the planting of olives upon the property will begin at once.

Over $100,000 worth of almonds was produced this year by Capay Valley (Yolo County) almond growers, according to an estimate given by a conservative rancher.

A meeting was held at the chamber of commerce at Napa last week by the Napa Grange, at which control of dairies and functions of the state dairy bureau were discussed.

Yolo County reports large quantities of barley sold at satisfactory prices, but it is also estimated that more than three-fourths of the crop of that county is yet to be shipped.

The California Development Board will take up the matter of aiding Belgians to come to California and to that end will present the matter to the state legislature as soon as convenient.

At the annual convention of the farmers' union at San Jose the following officers were elected: D. M. Utter, Campbell, president; G. R. Lynch, Morgan Hill, vice-president; Fred Millard, Los Gatos, secretary-treasurer; executive committee—Fred J. Currier, Cupertino; H. C. Hagan, Gilroy; Massey Thomas, Gilroy; J. E. Parrish, Arroyo Grande; A. Kammerer, San Jose. The executive committee was empowered to establish a commission house in San Francisco similar to that in operation in Los Angeles.

At a meeting of the board of directors of the California Grape Protective Association a committee of five was named to prepare legislative suggestions to be submitted at a mass meeting of grape growers and wine makers, to be held December 19, at San Francisco. The committee consists of Frank T. Swett, chairman, representing the grape growers of central California; C. E. Humbert, representing the dry wine section; F. A. Lucas, representing the growers of Southern California; Burton A. Towne, representing the growers of the San Joaquin, and Theodore Bell, representing San Francisco.

Central California

Oranges are being picked in the Oakdale section of Stanislaus County.

A number of Visalia farmers will experiment with planting sugar cane this year.

Stanislaus County is holding its annual poultry show in Modesto December 2-5.

An Oakdale olive grower reports the offer of an olive buyer to contract all his olives for 20 years at $225 per ton.

The Associated Raisin Company reports the receipt of over $300 daily for the $1.00 Christmas packages of raisins.

Seven hundred and eighty tons of raisins from 680 acres of vineyard is the record made by the university farm near Fresno.

Farm Expert Amundsen of Fresno County is instructing peach growers in best methods of pruning, spraying and other problems.

The second annual show of the Porterville Poultry and Pet Stock Association will be held at Porterville December 15-17.

An outbreak of hog cholera in the Pajaro Valley has been practically stamped out, it is claimed, through general use of vaccine.

A farmers' institute was held in Greenfield, Monterey County, November 27-28. The local grange served a dinner on November 28.

The meeting of the farmers' institute held at Merced last week was devoted to a discussion of the hog industry of the San Joaquin Valley.

The second annual poultry show of the Porterville Poultry and Pet Stock Association will be held December 15-17. E. D. Fawcett is show manager.

Fumigation operations in the citrus orchards of Tulare County have ceased. According to the announcement of County Horticultural Commissioner Collins, the fight against the soft gray scale which has been waged during the past season has been most effective.

The recently organized Central Stockmen's Association is offering a reward of $1000 for the arrest and conviction of any cattle thief. The membership of the association is made up of cattlemen of Kern, Kings, Fresno, Monterey, San Luis Obispo and Santa Barbara Counties.

Chester H. Rowell, editor of the Fresno Republican and a member of the state commission of the Panama-Pacific International Exposition, has been appointed a member of the board of regents of the University of California, to fill the vacancy caused by the death of Frederick W. Dohrman of San Francisco.

Plans to establish a commission house and selling agency, operated by and for the benefit of the California farmer, were made by the Farmers' Educational and Cooperative Union, which held its annual meeting at San Jose November 12. The following officers were elected: President, D. M. Utter, Campbell; vice president, G. R. Lynch, Morgan Hill; secretary-treasurer, Fred Millard, Los Gatos.

Southern California

Santa Barbara County will be represented at the fifth national orange show to be held in February.

Colton, San Bernardino County, is taking steps for protection against the storm waters of Lytle Creek.

The Hemet Orange Growers' Association shipped out its first carload of oranges the middle of the month.

Bloomington, San Bernardino County, has its largest crop of olives, and the olive mill is running full capacity.

Blythe, Riverside County, will hold the Palo Verde Valley fair December 5. There will be exhibits of agricultural products.

Citrus growers of the Yucaipa Valley are discussing the advisability of inspection of all citrus stock shipped to that section.

General Manager Powell of the California Fruit Growers' Exchange has placed the 1914-15 output of citrus fruit at 45,000 cars.

The walnut crop of the Hemet Valley, it is estimated, will net the growers $12,000. It is thought the output will be doubled within the next three years.

Villa Park, Orange County, reports navels coloring up rapidly. The fruit is about two weeks in advance of last season. Shipments are expected to begin about the middle of January.

Five hundred and forty thousand dollars has been received by walnut growers of the Whittier district, including the La Habra, Los Nietos and Ranchito sections, for the 1914 walnut crop.

Carl A. Johnson, manager of the Holly Sugar Company in Orange County, announces that his company has enough beet seed in its warehouses today to supply the demand for the 1915 crop.

Apricot growers of Orange County are still holding between 400 and 500 tons of dried cots. About 15 tons have been bought up within the past two weeks and the growers are feeling somewhat encouraged.

Experimental work of the California Citrus Experimental Station, with practical methods for orchardists to treat diseases and other troubles encountered, and cultural methods for the handling of orchard properties, will be an interesting feature of the coming orange show.

By an agreement on the part of the Southern Pacific Company to part with its holdings in, and claims against, the California Development Company the irrigation controversy of the Imperial Valley is nearing an end. If negotiations with other creditors are carried through the receiver for the company will have $275,000 to aid in settling with claimants.

A clause in new beet contracts offered by sugar factories of Orange County provides that if the average net selling price of beet sugar received by the beet sugar factories of Southern California shall equal or exceed four and one-half cents a pound during the period between July 1, 1915, and May 1, 1916, the growers will receive a bonus of 50 cents a ton.

The Coast

Oregon is shipping apples to Siberia.

Frozen Chinese eggs have been sold at Seattle as fresh eastern stock.

Chandler, Arizona, turkey raisers sold their Thanksgiving output at 20 cents.

Rabbit breeders of Spokane, Washington, are planning for an annual show.

The Northwest Livestock show was held at Lewiston, Idaho, November 30.

The fourth annual Irrigation Congress of Oregon will be held at Portland, Jan. 7-9.

The third annual of the Arizona State Poultry Association will be held at Phoenix, Dec. 9-12.

The Washington committee on irrigated and irrigible lands will meet at North Yakima December 16.

A number of Washington farmers have orders for Thanksgiving turkeys to be shipped by parcel post.

The Fruit Growers' Exchange of Hood River, Oregon, has closed its pools on the season's pear crop.

The seventh National Apple Show was held recently at Spokane, Washington. The attendance was immense.

The Arizona commission of agriculture and horticulture has ruled that all citrus stock not grown in that state is barred.

Nearly 5000 carloads of fruit have been shipped from Wenatchee, Washington, this season, the greater portion being apples.

One hundred and eighty-five thousand acres of the Crow Indian reservation in western Montana has been thrown open to homesteaders.

Governor Hunt of Arizona has proclaimed a quarantine against incoming cattle from all states lying east and north of the state of Texas.

A $25,000 herd of Holstein cattle is being held in isolation pens at Spokane. They came from a foot and mouth disease infected state.

The Fruit Growers' Exchange of Hood River, Oregon, has closed its season's work. Extra fancy stock netted from $1.10 per box to as high as $1.75.

Governor West of Oregon has issued a proclamation preventing the importation into that state of cattle from states where foot and mouth disease is prevalent.

Great interest is being taken by farmers of Willcox and vicinity in Arizona in the demonstration train which has planned for a trip during the first two weeks of the month.

At the National Apple Show and Fruit Products' Congress held in Spokane during all of last week a feature of especial interest was the demonstrations given to show 219 ways in which the apple may be prepared in appetizing dishes. The domestic science departments of the Washington state college, the university of Idaho and other educational institutions of the two states joined in these demonstrations.

The Wrong Oil Ruins Your Separator

To lubricate your separator with ordinary or general utility oil is one of the quickest ways of sending it to the junk pile. You need a special oil for the finely adjusted mechanism of this delicate farm machine.

Standard Hand Separator Oil

is made especially for cream separators—and for that reason it will most satisfactorily lubricate your separator. It keeps the bowl spinning smoothly and enables you to get *all* the cream. It doesn't "gum." Saves repair expense. Lengthens the life of your separator. Ask your dealer for Standard Hand Separator Oil.

Live Stock and Dairy

THE RUNT PIG

Written for California Cultivator by Sacramento Valley Contributor.

In almost every litter of pigs there is a runt. Just what to do with runts is a problem that confronts every hog raiser. Ordinarily these undersized, slow growing little fellows are left to shift for themselves along with the larger ones in the litter and they become more pronounced runts all the time.

Some hog growers say "knock them in the head and get rid of them," but that is a policy that many of us do not approve. Instead, we believe it is best in every way, and a paying proposition, to give runt pigs a show and make them make the greatest possible return for the care and feed invested in them.

Small undersized pigs should have all of the feed they can eat, and it should be a combination of everything on the place that is good for hogs. If milk of any kind is available a liberal portion should go to the pigs, then table scraps or swill, soaked barley, soaked corn, alfalfa pasture or green cut alfalfa, a little oil meal; as many as possible of these things can profitably be included in the ration.

There should be a separate pen joined to the one in which the sows or other hogs are kept, but so fixed that only the small pigs get into the place where they are fed. This can be done by raising a panel a few inches off the ground so that only the small pigs can get under. In this small pig feed place all of the litter will feed as long as they are getting milk from the sows, and the way to insure the runts getting all that they should is to have ample trough room for all of the pigs to be fed there and feed plenty so that the runts may keep on feeding after the others have finished, if they want to.

After the litters are weaned it is a good plan to place the runts and small pigs in a pen by themselves or shift them into a pen of smaller pigs where they can have access to all of the good feed they can eat.

Lice, ticks, scurf and all of the ills that hogs are heir to seem to find the unthrifty pig the most attractive "bait." Keep a close watch on these young pigs, and whether there seems to be anything the matter with them or not dip them occasionally. This can be easily done by mixing a tub of some good dip, using it according to directions, holding the pigs by hind and forelegs and giving them a "ducking" once or twice, making sure to get them good and wet all over.

All kinds of stock pay well for intelligent care and attention, even the runt pig.

PROGRESS OF THE FOOT-AND-MOUTH FIGHT

The order signed by the secretary of agriculture lifting the quarantine against Canada on account of the foot-and-mouth disease is regarded by the authorities here as encouraging evidence that they are "on the outside of the disease." This means that there are grounds for the belief that quarantines already declared have been sufficient to stop the movement of infected cattle and that the disease can now be held within the limits of the areas already quarantined. It is quite possible, of course, that sporadic cases may be found in one or two more states, but it is hoped that even if this does occur the damage will not be serious.

Another cause for encouragement is the fact that although a shipment of infected cattle reached Spokane, Washington, some days ago, no new cases have since been reported from that state. This is taken to mean that the diseased cattle were killed and buried before they had had an opportunity to spread the disease; in consequence, it has not been considered necessary to quarantine Washington.

At the present time the states most seriously affected are Ohio, Illinois, Indiana and Pennsylvania. These are all feeding states; that is, states in which farmers make a practice of buying cattle and swine and finishing them for the market. The quarantines, which not only prohibit the export and import of live stock from infected states, but also the import of cattle from uninfected areas for any purpose except immediate slaughter, interfere, of course, with this business. This implies considerable loss to the farmer in addition to the expense incurred by the government in the slaughter of the actually infected herds.

Outside of this belt the three New England states of Connecticut, Rhode Island, and Massachusetts are perhaps the subject of the greatest concern. These are small, densely-populated states. Although the actual number of cattle already infected is comparatively small, it will probably be some time before any of the quarantines can be lifted in this region.

On the other hand, the situation in New York seems to be fairly well in hand. The greatest single loss has been that of a dairy herd of 289 cattle which was found infected in the Borough of Queens on Long Island. The entire herd had to be slaughtered. Its value was appraised at approximately $22,500. The Buffalo stockyards have also been infected, and some cases have been found in Erie County in the immediate vicinity. Otherwise, the disease has been confined to one or two sections of the state and does not appear to be spreading. In Delaware also, the disease has been confined to Wilmington; and in New Jersey, to Hudson County. A portion, at least of both these states, it is hoped may be released from quarantine at an early date.

The greatest encouragement of all, however, is probably found in Michigan. The outbreak originated in Michigan, and it first spread fast. Now, however, it is believed that all infected stock have been put under ground and the state it is hoped is really clean. To make certain of this, however, a farm-to-farm inspection is now being made in all regions previously infected. In this connection it is pointed out that 18 shipments of diseased stock were traced from Chicago

LOUDEN

STALLS and STANCHIONS

The Clean-Cut Simplicity of Louden Stalls and Stanchions in design and construction; their absolute freedom from dirt-gathering cracks, crevices, corners or attachments, make them the **only really sanitary barn equipment.**

The Superior Flexibility of the Louden Stanchion permits the cow to lie down or rise without the dangerous straining common to the more rigid type. The Louden Stanchion (all steel or wood-lined) is an absolutely safe and comfortable stanchion.

Louden Stalls and Stanchions are built of the finest, high-carbon tubular steel and are exceptionally strong, easily installed and cost no more than wood.

We also manufacture Feed and Litter Carriers, Spring-balanced Mangers and Manger Partitions, Bird-proof Barn Door Hangers, Hay Tools, Power Hoists; Calf, Bull, Cow and Pig Pens, Window Ventilators, Etc.

Write us for Free Illustrated Catalogs, or see your dealer. We can be of service to you in planning your new barn. Our barn experts will give you FREE sketches and suggestions that will be of value Write us.

into Michigan, and that as far as is known now, all of the animals in these shipments were slaughtered and buried without their having communicated the disease to a single animal on adjacent farms.

Kentucky also, it is believed, will soon be free from quarantine. The disease has appeared in only three counties and considerable progress has been made in ascertaining that the rest of the state is clear of the infection. In Iowa and Wisconsin the infected areas appear to be definitely defined, and portions of these states may soon be released from quarantine. The difficulty in releasing portions of the state only lies in the fact that the state authorities must then guard closely the line that separates the quarantined from the unquarantined portions. At best, this is a difficult undertaking, and unless it is absolutely certain that the separation would be rigidly enforced, the federal authorities consider that the only safe method is to maintain state boundaries as the limits of the quarantine.

In Montana the situation is still a little in doubt. In the first place, a shipment of infected cattle was intercepted at Glendive. Furthermore, another outbreak has occurred near Terry, the extent of which has not yet been definitely determined, though it is probably confined to two or three counties.

Although the spread of the disease into areas previously uninfected seems to have been in a great measure checked, it is estimated that it will take at least six months to stamp out all traces of the infection. In this work, it will be of great assistance if snow comes quickly to cover the ground. Quarantines, it is announced, of whole or parts of states will be lifted as rapidly as safety permits.

BUTTER MAKERS CONTEST

A valuable work in improving butter making methods in California is being done by the University of California through its periodical, "Educational Butter-Scoring Contests," conducted by Professor L. M. Davis. The fifth entry for 1914, scored in San Francisco last week by T. J. Harris, official inspector of the San Francisco Wholesale Dairy Produce Exchange and Professor Davis and Instructor H. S. Baird of the University dairy division, showed the following scores achieved by some of the state's most skilful butter makers:

Peter Peterson, Valley Flower Co'op. Creamery, Ferndale	94
C. G. Plunkett, Visalia Creamery, Visalia	93½
J. N. Jensen, Visalia Coop. Creamery, Visalia	93
J. Clausem, Riverdale Cooperative Creamery, Riverdale	92½
Glenn Decow, Mission Creamery, Perris	92½
Ira D. Whitaker, Stanislaus Creamery Co., Modesto	92½
N. Christensen, Dairymen's Cooperative Creamery, Tulare	92
J. C. Phillips, Delta Creamery, Imperial	92
P. Lernasconi, Harmony Valley Creamery, Cayucos	91½
F. H. Worthington, Holtville Cooperative Creamery, Holtville	91½
C. A. Johnson, Grace Brothers' Creamery, Santa Rosa	91½
Simon Koppes, Montague Creamery, Montague	91½
Wm. Oelkers, Mindin Butter Mfg. Co., Mindin, Nev.	91½
A. L. Bailey, Ceres Creamery, Ceres	91
Ed. Hooper, Spreckels Market Creamery, San Francisco	90½

Butter making, cheese making and ice cream manufacturing are all being taught by the University of California to throngs of students at the

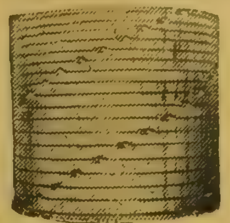
SILOS

All sizes and dimensions made to order for your particular conditions.

This is a Photo of the 20x40 Redwood Stave Silo Manufactured and erected by us on the Sheldon ranch, Kenwood, California.

TANKS

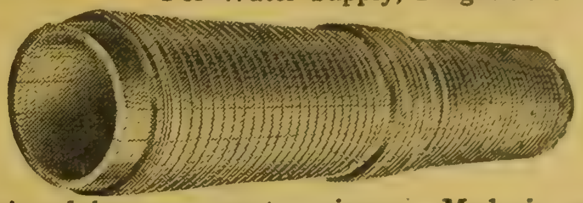
From 500 to 500,000 gallons capacity.



Built to suit All Uses and Users. Cheaper than Metal Tanks, last 10 times as long.

PIPE

Machine Banded or Continuous Stave. For Water Supply, Irrigation or Power.



All Designed by our expert engineers. Made in our own immense factory from clear, air-dried redwood, selected from Air-Dried Stock of 40 Million Feet, which we carry at our plant at ALL times. Write Us for Prices.

MORE MILK AT LESS COST

500 LBS. MORE MILK per day by feeding

LARROWE'S DRIED BEET PULP

READ THIS LETTER from Hutton Bros., proprietors Dixon Certified Milk Farm, Dixon, California:

"It might be of interest to you to know the results of feeding Larrowe's Dried Beet Pulp at our dairy. We are milking 167 cows and are feeding 1200 pounds of pulp per day about 7 pounds to the animal. The pulp is fed in addition to a grain ration of 5 pounds per animal, together with all the alfalfa hay they will eat. As stated above, the grain and hay is our regular ration, and the beet pulp increased our milk yield almost 500 pounds per day. The increase was during the stormiest and most uncomfortable weather of last winter. When we were getting these results from this method of feeding, our supply of beet pulp was suddenly exhausted and for several days we were unable to get any more because of the washouts on the railroad. Our milk output almost immediately fell off the amount of increase mentioned, thus furnishing absolute proof that the pulp is to be given credit for our unusual milk yield, which has again attained the maximum since we obtained a fresh supply upon the arrival of the delayed carload. We unhesitatingly recommend beet pulp to any and all dairymen who feed for results."

Be sure you get LARROWE'S Dried Beet Pulp. It is uniform in color; never blackened or burned.

Larrowe's Dried Beet Pulp is clean, healthful, succulent, and will not only increase your milk yield, but also keep your stock in better health and condition.

It is simply the pure shredded root of the sugar beet with only the sugar and water extracted. Always uniform. Keeps indefinitely. 1 ton contains as much nutriment as 5 tons of silage. It is light, bulky; aids digestion and is a wonderful feed for dairy cows, hogs, horses and poultry.

Get 1 Sack From Your Dealer Today and prove its worth by feeding to one cow whose milk record you know. You'll get instant results.

"PROFITABLE FEEDING"—our illustrated booklet giving feeding instructions and other information—will be mailed free on request.

THE LARROWE MILLING CO.
607-608 Central Building
LOS ANGELES, CALIF.

Some feeders prefer Larrowe's MOLASSES-Dried Beet Pulp for its sweetness. Just the plain pulp with beet molasses dried. Fine for fattening, also for horses.

university farm at Davis. When the new term opens there in January, an influx of new farm school students is expected, while also a large number of students from the four-year course in the college of agriculture will go up from Berkeley to Davis to spend a half year at the university farm.

ANALYSIS OF STRAW

We have had several requests for feeding values of various straws. We requested information from M. E. Jaffa, professor of nutrition of the state university, and he sends us the following analysis. Regarding the one sample of lima bean straw which analyzes so high in protein Professor Jaffa says: "It will be noticed that one of the analyses shows 10 per cent of protein. This was due to the fact that while it was called lima bean straw it was not what one would call well-thrashed straw."

Analysis of Straw—Pea, Lima Bean, Etc.

	Water. Pct.	Protein. Pct.	Fat. Pct.	Carbo-hydrates. Pct.	Crude Fiber. Pct.	Ash. Pct.
Lima Bean Straw	11.00	5.78	1.94	47.20	26.13	7.95
Lima Bean Straw	14.00	5.22	.74	39.60	36.14	4.30
Lima Bean Straw	10.00	10.72	1.92	46.66	21.14	9.56
Pea Straw	20.89	5.91	1.97	37.65	25.25	8.33
Pea Straw	13.60	9.00	1.60	33.70	35.50	6.60
Wheat Straw	9.60	3.40	1.30	43.40	38.10	4.20
Rye Straw	7.10	3.00	1.20	46.60	38.90	3.20
Oat Straw	9.20	4.00	2.30	42.40	37.00	5.10
Barley Straw	14.20	3.50	1.50	39.00	36.00	5.70

ACORN DISEASE

Farmers whose pastures include oak groves will do well to fence off the oak trees, for acorns are responsible each year for the death of many head of young stock.

Young cattle, particularly those under 18 months of age, according to F. B. Hadley, veterinarian of the College of Agriculture, University of Wisconsin, are most subject to acorn poisoning. Sheep and hogs, apparently, are not affected even if they eat large quantities of the acorns, and mature cows seldom die from eating acorns, but their milk flow is usually diminished when feeding upon pastures in which acorns are available.

Symptoms of acorn poisoning may not be seen until a fortnight after the acorns have been eaten. Then the animals become constipated, lose their appetites and cease to chew their cuds. In the advanced stages intestinal irritation and diarrhoea may set in and continue until the animals die.

As but little can be done in the way of treatment, it is all the more important that care be taken to prevent cattle from feeding on acorns. Half pound doses of common baking soda dissolved in water and given three times a day are useful in overcoming the tannic acid of the acorns, which is thought to be the poison responsible for this trouble.

PUTS END TO "ALFALFA-TASTE"

Does your butter taste of alfalfa? Then see to it that your butter maker pasteurizes his cream, and there'll be no more "feed flavor."

Pasteurizing pays declares L. M. Davis, assistant professor of dairy industry in the University of California. Cream is pasteurized by heating it to 145 degrees for 20 minutes. This not only helps the flavor but protects the public by killing any germs of disease which might find their way into milk, from tubercular cows or milkers with diphtheria or typhoid.

The University of California was one of the pioneers in California in pasteurizing cream for butter making. It introduced the method some years ago at the university farm creamery at Davis, and ever since has issued its butter under a label stating that it is "guaranteed under the pure food and drugs act as made from efficiently pasteurized cream." Now this practice of pasteurizing has spread widely through California.

ANOTHER WORLD'S RECORD BROKEN

The Holstein-Friesian cow, Duchess Hengerveld Korndyke, has broken the world's record for butter production in the senior three-year-old class of the semi-official yearly division, by producing in 365 consecutive days 1129.2 pounds butter from 22,897 pounds of milk. She freshened at the age of 3 years, 9 months, 19 days. She is now the world's champion senior three-year-old. Her brother, John Hengerveld Paul Wayne, is owned by Geo. A. Smith, Corcoran.

CONCRETE LINING

A bulletin of particular interest to irrigationists is No. 126 of the United States department of agriculture. Though it is in the professional paper class it has practical interest for all irrigators. It is by Samuel Fortier, chief of irrigation investigations and has to do with concrete lining as applied to irrigation canals. There are many half-tone illustrations taken from California and other Pacific Coast irrigation systems.

FINE HOLSTEINS

As the time for Geo. A. Smith's Holstein sale draws near it may interest those of your readers who are in the market for pure-bred Holsteins to read something of these cattle outside of the advertising columns.

Mr. Smith recently purchased the writer's entire herd, and while I will not go into detail as to individual breeding, I will call attention to the great sires that were the foundation of the herd, and a glance at the catalogue will confirm what I write. De Kol Burke, the sire of our great California cow, Riverside Sadie De Kol Burke, was one of them. Homestead, Jr. De Kol, sire of the world's record butter cow, Grace Fayne 2nd Homestead, 35.55 pounds butter in seven days, was another. There was also Duchess' Ormsby Piebe Burke, a son of the high-testing Duchess' Ormsby Piebe De Kol Burke with his long list of high-testing daughters, and last but not least, the great King Segis, who is represented by a grandson who has a pedigree worth considering, and nine daughters in the sale.

Another item that is fully as important as breeding in regard to the herd sold Mr. Smith is the fact that the cattle were always kept under sanitary conditions, and they are all healthy and free from tuberculosis—a case has never been found in my herd.—N. E. Mulick, Willows.

December Photo Contest

SUCH an attractive home scene has been submitted in the contest for this month that it takes precedence over many other photos of farm pets and farm animals. Almost as many photos were submitted for this contest as for that of November and that was a record-maker.

A TYPICAL CALIFORNIA RURAL HOME.
First Prize Photo by Miss E. S. Smith, Nordhoff.

The first prize winner is a most attractive illustration of a home which is typical of many in rural sections of California. A landscape artist might criticize one of two features of it somewhat but even then he must admit it is a most home-like scene. Let us increase the number of such home scenes in California and increase the number of such photos in our contest.

GOING TO THE FAIR.
Second Prize Photo by C. W. Vannote, Gridley.

The second prize winner is "some pumpkins," It is equipped with self-starter, six cylinders and all other equipment of a modern auto. The driver does not seem to keep his eye on the road but he will surely get there.

Let us have a bigger collection than ever for the first contest of 1915. We will want all photos in hand before the evening of December 30. Send in the photo of the Christmas tree for a Christmas scene will be most attractive to our eastern subscribers. The contest, however, is not limited to that class of photos but the best all-around California rural life scene will be the winner.

First prize, $2.00; second prize, $1.00 cash.

The Next Contest

The next prize contest is for a menu for a Christmas dinner, recipe for one dish and your plan for preparing the dinner so that as little work as possible is left for Christmas day itself. For the best menu $2.00 cash will be given. For the second best, $1.00. A six months' subscription to the Cultivator will be given to all whose menus are published.

Cultivator for Six Months

To all whose menus are published. When you send in your menu, send also name of one of your family who is now receiving the paper so his or her subscription may be extended rather than having a second copy go to your address for the six months.

Write Early

Address all letters to California Cultivator, Los Angeles, and mail them so they will reach this office by the morning of Thursday, December 10. The articles will appear in the issue of December 17 in time to give everybody opportunity to profit by the Christmas dinner suggestions.

AUTOMOBILES OF GREATEST BENEFIT TO FARMERS

Written for the California Cultivator By Sacramento Valley Contributor.

Farmers have been benefited more by the automobile than any other class of people. One of the great problems in agriculture is transportation. Time, to the value of millions of dollars, has been spent in going to and from market and in doing the thousand and one errands required in the operation of a farm and the conduct of a farm household. This time could have been, and now is, greatly reduced by the use of the automobile. In some districts in California as great a number of farmers use automobiles for "going to town jobs" as use horses. In the olden days when horses furnished the only motive power for wagon road transportation it required the best part of a day for the average farmer to go to town and back. By average is meant a considerable distance from town, for the greater per cent of the farmers in any community or county live far enough from town to make the trip by team "spoil" the day as far as work in the field is concerned.

The benefit of the automobile has extended over the whole field of agricultural endeavor. The big stockman who has cattle, sheep or hogs at various ranches finds it the most economical way to cover distance and conserve his time, even though he may be a great lover of horses and needs and uses many saddle horses on his ranch.

Many operators of large dairy ranches deliver cream to the shipping station or the creamery with an automobile truck or an automobile that may be converted into a semi-truck.

Breeders of purebred stock find an automobile the most satisfactory way to transfer crated hogs, sheep, chickens, calves and even, at times, mature cattle from the farm to the express station or boat.

Many of the new settlers on subdivision tracts throughout the state have automobiles. They are pioneering in a different way from their forefathers who moved from the eastern states to the prairies by way of ox teams and "schooners." There is no time in the history of a farm when a "machine" is of more real service than during the period of getting started, building houses and barns that always require running to town after the nails or hardware or something that has been overlooked or is short. Then in starting new machinery, few have ever been smart enough to be able to foresee all of the things that are apt to happen, and in remedying these oversights the automobile reduces days to hours.

On almost every farm at some time during the year there is a job of threshing or silo filling or fruit dipping and drying in which a comparatively large number of people are engaged. A break in any part of the machinery, often as little a thing as a bolt, will require a trip to town and lay up the whole job until the repair has been made. To be able to make the trip in an automobile reduces the delay to a fraction of what it would otherwise be. The direct saving of wages in such an emergency might easily be enough to pay the upkeep of a car for many months.

The automobile is a factor in American life that is now absolutely indispensable and would make automobile-making a big industry, even if no cars were ever run solely for pleasure.

GARDEN HARMONY

(Continued from page 554)

acres of any tropical fruits, not even avocados, but believe every home owner should plant a few, not only avocados but a considerable list of tropical and subtropical fruits—all you have room for. Put in some carissas and guavas and at least two plants of Australian nut, the Macadamia ternifolia. In the guava bed should be found two or more of the Paraguay guava, Feijoa Sellowiana, for it seems these plants are frequently self-sterile or nearly so and need an interchange of pollen. When such specific needs become known (sterility is also common in isolated avocados) the semi-tropic fruits will rapidly gain in popularity.

Fertilizing Lawns

Do not fertilize lawns too early. Why should you feed adjacent property, rivers, or the Pacific Ocean with your lawn fertilizer? This you will do if you fertilize before heavy rains and allow the latter to wash away all plant food. Reserve fertilizer until the hardest and most rains have fallen; you need only enough water to carry the juices down into the soil; an excess carries them too far, both as to distance and, in light soils, depth also. Conserve plant food rather than waste it in flood water.

Care of Garden Tools

It is at this season of the year that garden tools suffer most. Not only do the rains rust iron, but alternate wetting and drying soon destroys the value of wood. The constant expanding and contracting of wood-work, first wet and then dry, also quickly loosens all iron work in contact with it and tools both "shaky" and constantly coming to pieces are the natural result. Proper painting much lessens these evils, but a better precaution is to keep tools well housed.

Made-Up Soils

Having fully made up my mind that all the ingenuity of man cannot surpass nature in soil making, I am in a proper state of mind to advise the purchase of land where the soil is naturally fitted for the particular crop or crops you wish to grow. In my own garden I have soils that, so far as composition is concerned, appear ideal. They are loose and friable as corn meal, not lacking in any plant food, and for top crops," those grown above the surface, they are unsurpassed. But for bulbs and other underground crops a virgin soil of the same foundation, to which lime and sand was added, no fertilizer, "scooped them to a finish." Ideal made-up soils always seem to me to be "dead" when handled, a fact for which I cannot account and one I cannot overcome.

COWS plus HOGS

Every good cow at Fairmead brings in around $8.00 per month cash. 25 cows means $200.00 cash each month. Two creameries collect the butter-fat, paying the highest prices. One acre of alfalfa at Fairmead will support a cow the year round or 12 to 20 hogs. Hogs can be produced at Fairmead for 4c per pound. Present prices 8c to 10c cash. Why not farm for real money

Poultry for Profit

COLD, ROUP AND CATARRH

An ounce of preventive may be worth a pound of cure. In fact it has proven so with us, and it is true with practically all poultrymen when it comes to the treatment of colds, roup and catarrh, says a bulletin from the Missouri Experimental Station. These diseases are responsible for the loss of thousands of birds each year. In fact, it is the most deadly of all diseases of adult poultry. Not only does it cause a tremendous number of deaths, but fowls which succeed in recovering from it should not be used for breeding purposes thus greatly increasing the loss due to its ravages. A great many people fail to distinguish between ordinary colds and genuine roup, due largely to the fact that the early symptoms are similar. Plain colds, however, are non-contagious and comparatively harmless, while roup is very contagious, usually either kills the bird or renders it unfit for further use. The first cases of colds should be taken as danger signals for roup, for when a chicken has a cold the roup germ can gain an easy foothold and usually does so unless special precautions are immediately taken. Your attention will usually first be attracted to birds that have taken cold by their sneezing or making a wheezing sound in breathing while they are at roost, and by a watery discharge from the eyes. Upon examination the feathers on the under side of the wing will often be foul and sticky, due to this mucous discharge from the eyes and nose. One or both eyes may be swollen or the lids stuck together by a sticky discharge. The appetite falls off, the feathers become roughed, and the patient has a generally run-down appearance.

MODEL POULTRY RANCH.

The most easily distinguishable characteristic of genuine roup is a peculiar and very offensive odor about the mouth and nose. As the case advances, a yellowish cheese-like mass usually forms in the nostrils, growing rapidly and sometimes entirely closing up the openings in from 24 to 48 hours. Cankerous growths often appear in the mouth, the eyes become feverish and inflamed, often swelling entirely shut, after which tumors sometimes develop, destroying the eye. The patient gradually weakens and death follows if treatment is not administered.

Upon the occurrence of an outbreak of roup the first thing to do is to take steps to check it as quickly as possible. All affected birds should be at once removed from the flock to a place that is clean, dry, well lighted, warm but well ventilated, and which can be thoroughly disinfected after the disease has run its course. Remove the litter from the houses and disinfect the houses and runs thoroughly with Zenoleum, Creolin or Cresol, mixed according to directions, or with a five per cent solution of carbolic acid. We have tried out and tested practically all the serums, "guaranteed roup cures," and remedies of various kinds recommended for roup. But we have come to the conclusion that the safest and best thing for any poultry raiser to do is to use all possible means to prevent the disease. This can best be done by breeding from healthy stock, providing comfortable houses which admit an abundance of ventilation and sunshine. The houses and yards must be dry. Ventilation, without drafts, is the best preventive. By all means have an opening near the floor to take out the bad air, if it is nothing but the exits for the fowls left open or covered with wire to permit of circulation of air. Most people imagine that the bad air in a poultry house is near the ceiling and they make openings there which take off all the pure warm air on winter nights, but the bad air, which breeds roup, settles nearest the floor. So in addition to your shutter, curtain, or open front, also have small openings near the floor in the front of the house to complete the system of ventilation and to take off the bad air. Be sure the floor and walls of the house are dry.

About every other day during the damp days of fall and winter, we would recommend the preventive treatment recommended by Tom

Pomona Deep Well PUMPS

—are efficient and reliable.

POMONA Manufacturing Co.
Pomona, Calif.
LOS ANGELES OFFICE
920 INVESTMENT BUILDING
8TH AND BROADWAY

Barron of England: Magnesia 4.6 parts, magnesium sulphate 52.1 parts, sulphate of iron (copperas), 8.0 parts, sulphur 14.0 parts, ground ginger 8.6 parts, water 7.0 parts, oxide of iron (rouge) 0.7 parts. Tablespoon to each 12 birds every morning. Feed this in a moistened mash for a few days to the flock if they are attacked with an epidemic of roup, diphtheria, chicken pox, canker, liver trouble, or appear to be out of condition. As the birds show signs of improvement, discontinue the remedy until it is needed again. For bad cases of roup make a pill about the size of the end of your finger and put it down the bird's throat. Where the bird's eyes are swollen shut it is a good idea to force a little rich, moistened mash down the bird's throat. Also dip the bird's bill into water if it cannot see to drink. If the bird is thin and low in vitality, no treatment will do much good and the best thing to do is to kill and burn it. The doctoring of sick birds is tedious and, for the most part, discouraging business. Unless they are especially valuable, the axe is the best cure for all badly affected birds. After the nostrils have been thoroughly cleansed by pressing out all the mucous possible with the thumb and finger, it is a good idea to dip the head of the bird into a pan of warm water into which you have poured Zenoleum, Creolin, Cresol, or some other disinfectant. After the bird's head has dried, take an ordinary sewing machine oil can and inject a little of the following mixture into each nostril: three parts coal oil or kerosene, one part Zenoleum, Creolin or Cresol.

Mix these thoroughly and shake well each time before using. Give this treatment at least once a day. If the eye is affected, remove all mucous or cankerous substance and drop a mixture of equal parts water and Zenoleum, Creolin or Cresol, or some such disinfectant into each eye. If a tumor has formed about the face beneath the skin, open it with a sharp knife and allow it to bleed freely and press out all the substance which has collected and caused the tumor. Wash it with the disinfectant and water and then fill the opening with powdered alum.

Always bear in mind that an ounce of roup prevention is worth more than a pound of roup cure.

POULTRY SHOW FEATURES

An excellent feature of the Poultry Show that is to be held at the Auditorium, San Francisco, December 8 to 13, is the yard system of exhibiting fowls. A limit of ten birds is made to a yard. While these birds are not eligible for prizes, nevertheless they will be a great factor in affecting sales. When birds are grouped in this manner it makes it much easier for buyers to select the type of fowl they are after. A sales secretary will be on the floor to assist buyers and sellers, and no charge will be made for his work.

Another feature that should prove of great value to producer and consumer is the egg display. Every phase from packing to candling eggs will be shown. The eggs of the various breeds will be given a place, so that a comparison can be made. To show the producer the advantage of raising only first class eggs the various types that come into the market each day will be labeled with the average prices for a year. Alongside the extra choice eggs will be the alfalfa, the spotted, the bloody clot, the dirty, and all the other imperfections that go to take the profits out of the poultry business. The loss in price due to carelessness in shipping extra grade eggs will also be shown. Bad packing, not grading according to size and not washing the eggs will all be displayed so that even he who runs may read.

The show secretary is E. J. Talbot, Mutual Savings Bank, San Francisco.

HANDLING EGGS

The great spoilage of eggs in this country is due to bad handling and is quite unnecessary. Part of the remedy is to teach everybody, from the farmer to the consumer, how to tell the quality of an egg without breaking the shell. The country buyers, the middlemen and the housewife, judge of the quality of the inside of a cucumber or an eggplant, or any other vegetable, by the appearance of the outside and the firmness of its texture. It is not possible to tell the quality of an egg by looking at the shell, though it is safe to say that the eggs with shiny shells are apt to be aged. A fresh egg looks as though it had been dusted with a very fine powder; the "bloom," as the egg men say. But in order to know what is inside the shell the egg must be held in front of a strong light—such as an electric bulb furnishes, which comes through a hole about 1¼ inches in diameter. The room must be dark. When the egg is held close against the hole the bright light renders its contents visible, and the quality is indicated by the appearance of the yolk, the white and the air space at the blunt end. There are many egg "candles" on the market, but the housewife can easily make one for herself by cutting a hole in a small pasteboard box, which is slipped over an electric light bulb. If gas or an oil lamp is the source of light, a tin box or can should be used.

POULTRY SUGGESTIONS

Human sympathy to the bird's comfort amounts to dollars and cents.

Clean the nests occasionally and put in a fresh supply of nest material.

Uniform nest boxes add to the attractiveness of the house.

White diarrhoea is contagious among young chicks.

The purchase of a few baby chicks from some fine pen of birds will make a splendid start if you care to start in June.

If your breeding pens were properly bred and mated you need not be surprised to find some of the chickens developing into finer specimens than their parents.

Watch the chicks closely and mark the ones making the most satisfactory growth. Select the ones that are plump, full breasted and in good proportion. You will not care to keep those that grow leggy and have thin breasts.

Never, under any circumstances keep more birds than you can take care of well.

Green food is necessary for all ages of poultry but doubly so for the little chicks. Water and green food are cheap and very important.

Be sure the baby chicks have plenty of exercise. Keep them busy and hungry.

Keep the hopper full of dry mash all of the time. This gives the chickens an opportunity to balance the grain rations fed.

Remember full fed chicks are paying chicks. It pays big dividends to hurry their growth.

Always practice absolute cleanliness in feeding.

The Fresh Air Brooder Stove

It exhausts warm **Fresh Air** from its **Base** to the chicks. If you use our stove you can't get away from proper **ventilation**. **Our 1915 Brooder Stove** is by far the best model we have ever produced. Let us send you our **New Catalogue**. It is full of splendid information **and** value to you with any **system**.

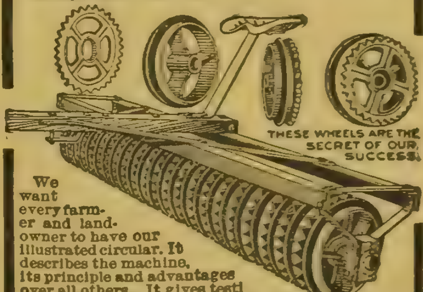
Germain SEED & PLANT CO. Established 1871
326-328-330 SO. MAIN ST.
LOS ANGELES. CALIFORNIA

3 MACHINES IN 1

A perfect seed bed is as important as to sow or plant. The Western Pulverizer, Packer and Mulcher makes a perfect seed bed and leaves a loose mulch on top to retain the moisture in one operation. It will double profits on crops. Made in 8 sizes, 1 and 3 sections. **Sold direct to you on one year's trial. Prices, $22.00 and up.**



THESE WHEELS ARE THE SECRET OF OUR SUCCESS.

We want every farmer and landowner to have our illustrated circular. It describes the machine, its principle and advantages over all others. It gives testimonials from many farmers proving what it will do on wheat, alfalfa and other crops. It contains valuable information on how to prepare the soil for better results. Send for this circular today, whether you want to buy or not.

EVERY HOME GARDEN as well as every market garden may now be cultivated with this cultivator at a great saving of labor, for it is **easy to operate, inexpensive**, and of great capacity. Write for descriptive circular and special introductory offer and write to-day for it will interest you.

FORD & CO., 11 Schofield Avenue, FREEPORT, ILL.

THE ALAMEDA COUNTY SHOW

The recent Oakland show makes the claim of a record breaker in many ways. The individual exhibits are said to have exceeded 6000.

In connection with the poultry show the California Pigeon Club and the Pacific Coast Rabbit Association held their shows and the combination made a strong drawing card.

Judge Russell of Ottumwa made the claim that this was the most successful poultry exhibition yet pulled off west of the Rockies.

The awards were:

Be sure you get "AMERICAN" Surface Irrigation PIPE

It is the best pipe for surface irrigation. "AMERICAN" pipe will last for a lifetime. It is the strongest made.

NO RIVETS TO PULL OUT.

"AMERICAN" Surface Irrigation Pipe is not riveted. We make a riveted pipe for UNDERGROUND use, but for SURFACE work riveted pipes have proven unsatisfactory.

THE DOUBLE LOCKED TURNED SEAM of the "AMERICAN" was originated by this company and has proven so successful that many inferior imitations have been put on the market.

EASILY HANDLED.

"AMERICAN" pipe is of heavy sheet metal in 10-foot lengths with a tapered sleeve at the end, making total length 10 feet 6 inches. Write for catalog.

HORTICULTURAL PRINTING

Catalogues for the seed and nursery trade. The live stock and poultry industries are a specialty with us. Two thousand illustrations to select from. Write for prices and samples. The Kruckeberg Press, 237 Franklin St., Los Angeles.

A CORRECTION

In the Cultivator of November 19th, appeared an announcement for the Los Angeles Soap Company of their new Mermaid Spray Powder for spraying citrus and deciduous fruit trees. Through an error on the part of the type compositor, the analysis was made to read—Curd Soap 50%, Bi-carbonate Soda, 5.0%, Carbonate Soda 37.5%, Balance Moisture.

This should have read—Curd Soap 50%, Bi-carbonate Soda 0.5%, Carbonate Soda 37.5%, Balance Moisture. We are making this correction so that there will be no misunderstanding as to the contents. The Los Angeles Soap Company have received a great deal of encouragement from professional sprayers and growers who have tried other powders and are now using Mermaid Spray Powder and claim it is an exceptional product. The company will be glad to send full information to growers or those interested.

Be Independent of Dry Seasons

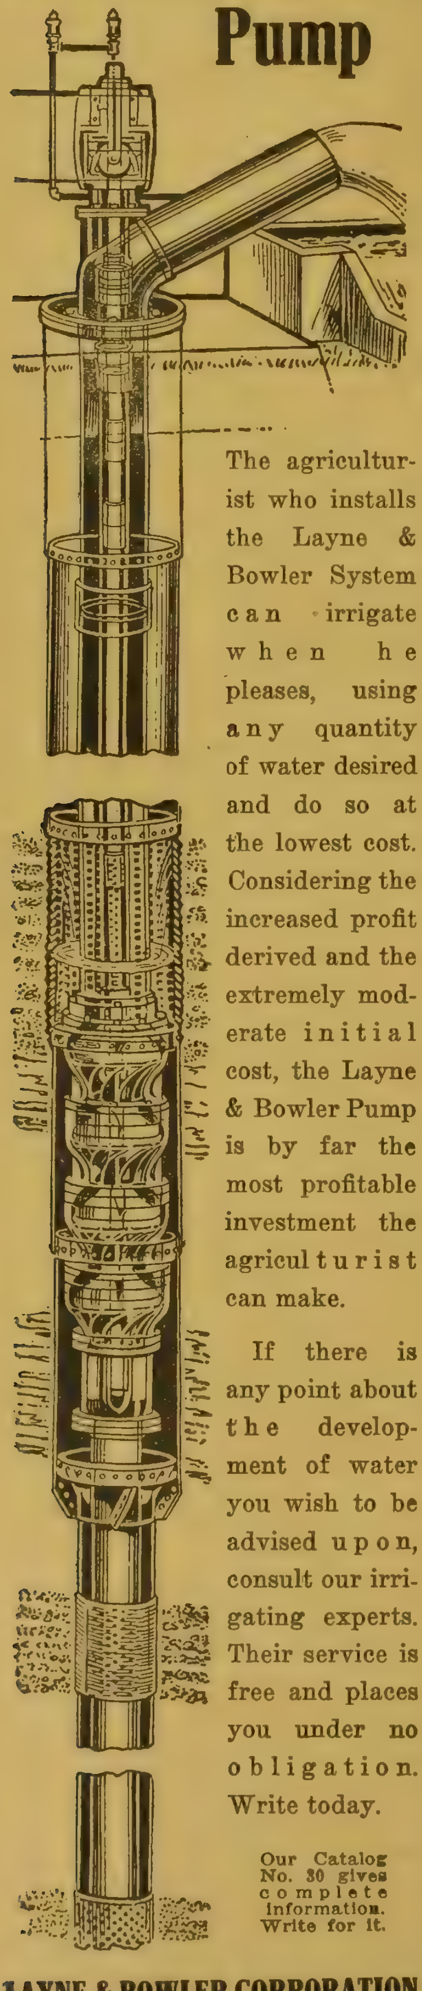
Raise Bigger Crops

Make Larger Profits

Produce Cheaper Water

By Installing the

Layne & Bowler Pump



The agriculturist who installs the Layne & Bowler System can irrigate when he pleases, using any quantity of water desired and do so at the lowest cost. Considering the increased profit derived and the extremely moderate initial cost, the Layne & Bowler Pump is by far the most profitable investment the agriculturist can make.

If there is any point about the development of water you wish to be advised upon, consult our irrigating experts. Their service is free and places you under no obligation. Write today.

Our Catalog No. 30 gives complete information. Write for it.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Money in Broilers

A Cultivator subscriber requests information regarding an account in an eastern magazine of a retired professional lady near Los Angeles who is making a large sum each year raising broilers. We have endeavored to locate this profitable broiler plant and referred the question to our poultry contributor, Mrs. J. A. Koethen, and she replies that perhaps it may not be wholly imaginary and calls to mind instances where certain people have for a time appeared to do well but the plants have ultimately been broken up. She adds: "The fact is there are sporadic successes but the broiler business as a specialty never succeeds permanently, as far as I can learn. It cannot, in the very nature of things, for the broiler specialist has to compete with the surplus cockerels from all the farms and back-lot poultry plants and all the commercial egg ranches. In the late winter and early spring, say from January till April, broilers bring good prices, 35 and often 40 cents a pound, live weight. This sounds pretty big but we have to consider that these broilers are hatched from 50-cent eggs so the profit is less than it seems. After the first of May the market is glutted with cockerels from everywhere, and there is no more profit in them. The only people who are in a position to make money from broilers, it seems to me, are the regular poultrymen who, having all their equipment ready, are able to get out broilers during the dull fall season as a sort of a side issue and get rid of them before spring hatching begins. I know of several who find this quite profitable. The man who should put all his money into equipment for raising broilers exclusively would have to make his profits for the first four months of the year cover the whole twelve months' expenses. I always suspect that people who say they have done so well don't figure carefully on the interest on investment, overhead charges, and all that sort of thing."

Silo

Kindly explain the filling, emptying and how to use a silo.—Subscriber, Newhall.

This is a long question, or rather one which leads to an answer requiring pages if the various details are given and it is now too late to make an extended article of interest for we presume there are no silos being filled this late in the season. In a word, we may say that corn, which is usually used for silage, is harvested when the grain is in the milk, is run through the cutter, cut into about one-inch lengths and a pneumatic elevator carries the freshly cut material into the silo, which is constructed of a size consistent with the size of the herd to be fed. As it is elevated and dropped into the silo it is thoroughly packed by two or three, or, in the case of a large silo, sometimes as high as a dozen men, tramping it down. If the corn is dry or the stalks ripened at all then water is added to be sure of sufficient moisture content. If thoroughly packed and the silo is built air tight after a few weeks of fermenting and heat which has been set up has destroyed the bacterial life, the silage, like canned fruit, will keep indefinitely but when exposed to the air it should be fed down every day and kept fresh for it will then very quickly decay. We have asked one of our contributors for an article as to value of silage and as to best crops to plant for it. This will be given within the next few weeks and will answer the question more intelligently and more fully. The matter of filling, however, will be a question for later consideration.

Alkali Spot

How can I reclaim a half-acre spot of land affected with white alkali? It dries out, crusts and cracks. Cannot get a good stand of anything planted on it. It is set to pear trees, some of which are looking well, others have died. There is no chance to drain. There is a stratum of sand ten feet down in which water stood before the level receded. Have been advised to use gypsum to neutralize alkali.—Subscriber, Santa Ana.

Gypsum would have no good effect on white alkali. If there is any black alkali present a liberal application of gypsum, say to the extent of a ton to the acre or even half that, will change the black alkali to white alkali, which is less caustic. We note you say there is no possibility of drainage but also say there is a stratum of sand ten feet from the surface. In such a case, with a plot of alkali in the center of a valuable place we would at least try the experiment of digging a shaft down to the sand, which we would board or curb up a few feet, covering with heavy plank and earth, and running drains from this shaft to various parts of the alkali plot. This would be somewhat expensive but might drain away the alkali and make this spot one of the most valuable on the ranch. Other than gypsum there is no chemical treatment within economic bounds.

Fertilizer Values

What is the plant food value of lima bean straw compared with horse manure?—Subscriber, Claremont.

Fresh farm manure contains about five pounds of nitrogen per 1000 pounds of material, about one pound of phosphorus and four pounds of potassium. Bean straw may contain as high as 15 pounds of nitrogen, one and seven-tenths pounds of phosphorus, and 11 pounds of potassium. This analysis would show the bean straw to be a much better fertilizing material than manure.

Aphis or Plant Lice

Is there anything which will kill pea lice?—Subscriber, Haywards.

The aphis or ordinary plant lice is one of our worst pests. It is easily killed but it is so wonderfully rapid in its reproduction that another crop comes on almost immediately to take the place of those which have been destroyed. A weak solution of tobacco extract sprayed over the plants will usually accomplish good results but it requires almost daily applica-

The Old Reliable

San Dimas Citrus Nurseries

Established 1890
Incorporated 1913

Citrus Trees Exclusively

All Leading Varieties

REMEMBER, MR. PLANTER

Practically anybody can grow a citrus tree, but it takes years of experience to produce a tree that will prove a money-maker when it comes into bearing. Nice-appearing nursery trees are desirable and promising, but do not always prove to be good bearing trees in the long run. Plant for profit and not for appearance only. Our trees are straight, thrifty, well rooted and have strong, full heads, but the main consideration is that: Our buds are carefully selected from heavy fruiting trees and will prove true-to-name revenue producers.

OUR TWENTY-FOUR YEARS

of experience in the growing and handling of citrus nursery trees gives the buyer the advantage of starting out RIGHT, thus avoiding disappointment at the end of four or five years' labor in bringing the young orchard into bearing.

ANOTHER POINT TO CONSIDER

Growing a good tree is only part of having it do well after planting. Many a good tree is ruined in the taking up from the nursery and shipping. We give the best of service in the proper handling and delivering of our trees.

WRITE,

'phone or call on us before buying your trees. Tell us your wants and we shall be glad to give you the benefit of our wide experience as to planting, soil conditions, fertilizers, etc.

Our illustrated new booklet on citrus culture mailed to any address upon receipt of 25 cents.

QUOTATIONS

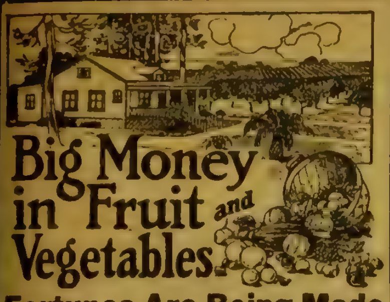
Teague trees are started right, grown right, and shipped right.



Big Money in Fruit and Vegetables

Fortunes Are Being Made

every year in Florida out of Fruits and Early Vegetables. Not a better spot in the whole state than BAY VIEW. Our big, free handsomely illustrated Book will prove it to you. Soil is deep, rich, sandy loam—very exceptional for Florida. Sample of this soil mailed free with literature. Plenty of rainfall 12 months in the year. Irrigation is unheard of. Crop failures practically unknown. Two and three crops easily raised each year on the same ground. $50 to $500 profit per acre each year. Satsuma oranges, figs, pears, peaches, plums, grapes and all kinds of berries produce abundantly. You can also raise enormous crops of corn, oats, hay, Japanese cane, clover, sweet and Irish potatoes, sugar cane, celery, tomatoes, lettuce, cabbage, watermelons, cantaloupes, egg plant, cucumbers, radishes, turnips and all kinds of early profitable vegetables. Ideal location for Dairying and Stock Raising. Ready markets and good prices. Grass for pasture the year round. Don't have to stable and dry feed six months in the year. One of the finest climates in the United States, both summer and winter. No sunstrokes in summer—no frostbites in winter. Ideal salt water boating, bathing and fishing. Lumber at wholesale prices. Good stores, churches and schools. WRITE TO-DAY FOR FREE BOOK, SAMPLE OF SOIL, MAPS, ETC.

It is a good idea to keep the "lid" on the family jar.

tion for a time to effectually control the pest. If the plants are situated where they may be reached with a strong spray from the hose it will aid materially. If tobacco extract is used it should be in the proportion of about two pounds of the extract (40 per cent) to 200 gallons of water. If preferred, stems and refuse tobacco may be bought of cigar factories, these to be steeped in water in the proportion of one pound to four gallons. Keep down all weeds or useless plants on which the pest may breed.

Government Land

Can you give me any information in regard to government land in the Klamath Project in Siskiyou and Modoc Counties, which is to be open to settlers December 30?—Subscriber, Wasco.

Write Alfred H. Taylor, receiver of the United States land office, Susanville, California, for information as to government lands in that district.

Trade-marking Name

Please tell me what I should do to have a name copyrighted, where to apply, and what is the fee?—Subscriber, Escondido.

We assume our subscriber refers to trade-marking a name in this state for the sake of securing exclusive use of it for a ranch home name or for brand for any California product. Write Secretary of State Frank C. Jordan, of Sacramento, and ask for blank giving full instructions. We believe the fee is five dollars.

Spray for Scale

Please give best remedy for the destruction of black or red scale on young citrus trees. Will Bordeaux mixture do the work, and when is the best time to apply?—Subscriber, San Gabriel.

The best treatment for the scale mentioned is fumigation, but this is work requiring a specialist, whom you should be able to secure in your section or through County Horticultural Commissioner Wood. In sprays perhaps kerosene emulsion is the best, though a strong solution of soapsuds is helpful. The special spray number of the Cultivator of September 11, 1913, gives particulars as to the making of various sprays. The Bordeaux is of no value in spraying insect life. It is only a fungicide.

Tepary Beans

I have heard of dry land beans called Teparies. Where can seed be had and have they been placed on the market?—Subscriber, Yucaipa.

The Tepary has proved well adapted to California conditions. The seed may be had of any seedman advertising in the Cultivator. At present the price is running practically the same as that of small white navy beans but they are claimed by many to be superior to that bean and in time may command a higher price.

"That fellow is merely sowing his wild oats," said the apologetic friend. "Maybe," replied Father Backup, "but when you get to sowing wild oats you seem to lose sight of the value of rotating your crops."

Lose not your trust, be true;
  Awhile the trees were bare,
The laughing brook was silent,
  And flowers lay shrouded where
They bloom today. Be patient;
  Joy will return to you.

"A little bed of flowers,
A little coat of paint,
Will make a pretty home
Out of one that ain't."

Save Labor on Your Farm This Winter

For less than half the cost of keeping an extra hand you can have your cows milked, your cream separated, and practically all your chores done by a

G-E ELECTRIC MOTOR FOR RANCH AND FARM

G-E motors will also drive irrigation or house pumps, circular saws, wood splitters, ensilage and feed cutters, corn shellers and many other farm machines besides household labor saving devices such as washing machines, food choppers, dish washers and the like.

A G-E motor is easy to operate, does not get out of order, and costs but a trifle to run. A G-E motor pays for itself many times over through savings in time, labor and wages.

Disposal of Estate

A man dying leaves a wife and children. He has some real estate and personal property, partly covered by debt. What disposition of same do the laws of California provide, there being no will or other paper of like import?—Subscriber, Orange.

If decedent leaves a wife and two or more children, property passes, after payment of debts, one-third to surviving wife and the remainder in equal shares to the children. If the estate is under $1500 it may all be set aside to the surviving family without payment of debts. In case of real property upon which family resides, a homestead may be set off for the use of the family.

Foreclosure of Second Mortgage

In foreclosure of second mortgage what is procedure and how long has mortgagor to redeem? During time of redemption who has possession of the property?—Subscriber, East Bakersfield.

Foreclosure of mortgage upon real property is had by filing complaint in the superior court of the county in which property is located. In case of second mortgage the title obtained by foreclosure is subject to the rights of the first mortgagee. The mortgagor has one year within which to redeem upon payment of the amount for which the property is bid in at foreclosure sale, together with one per cent per month interest thereon. The mortgagee does not by his judgment of foreclosure obtain title to the property until the expiration of the time for redemption, and therefore the mortgagor may remain in possession of the property during the period of redemption. There are provisions for the appointment of a receiver in cases of foreclosure of mortgages which are suitable on account of the expenses only in cases of large mortgages.

Bank's Lien

A buys for B a car of cattle and when cattle are delivered B pays for them. A has the cattle sold to C (B could not be there to get the money from C). B tells A to collect the money from C. A gets C's check for the cattle made payable to A. Before A gets C's check he gives B his check for the amount the cattle came to. Tells B he will put C's check in the bank to his credit, so B's check will be paid. A owes the bank money. B did not know it and when he presented check bank would not pay the money. A never had any money in the cattle. Can B collect from the bank?—Subscriber, Sultana.

A banker has a lien, depending upon possession, upon all property in his hands belonging to a customer. Your question presents the proposition that the money against which the bank enforced its lien did not in this case belong to the depositor. The weight of authority is in favor of your action against the bank, but there is strong authority to the effect that where you permitted the agent to deal with the property as his own, the liability of loss would be imposed upon you.

Filing on Water

Two years ago last May I filed on 160 acres of government mountain land. Am living on same. There is a canyon with water in it on this land, but to get the water where it would do me the most good it would have to be raised 200 or 300 feet, which I have not the means or time to do at present. Would like to know if anyone by filing or in any other way could deprive me of my right to the water, and if they can, what it is necessary for me to do to secure my right.—Subscriber, Chatsworth.

Anyone by filing upon unappropriated water and putting same to use may obtain an exclusive right thereto. Appropriation must be for useful purposes. As between appropriators, first in time and first in right. Persons desiring to appropriate water must post a notice in writing in a conspicuous place at point of intended diversion, stating therein that he claims the water there flowing to the extent of a given number of inches measured under a four-inch pressure, purposes for which he claims it, place for intended use, the means by which he intends to divert it, the size of the flume, ditch or pipe in which he intends to divert it. Copy of this notice must within ten days after its posting be recorded in the office of the county recorder and 60 days after posting of notice claimant must commence construction of his works and prosecute same uninterruptedly to completion.

Filing on Water

About 20 years ago I filed a water right on a spring near my place but located on the land of a neighbor with her consent. I placed two filings along the creek and one at the spring. Within ten days I filed copy of notice with the county recorder and inside of 30 days had the water piped to my house and barn. Can I hold this right if the present owner should sell out?—Subscriber, Lakeside.

Your proceedings to acquire the water right were correctly taken and furthermore the land of your neighbor has become charged with your right through prescription; the land being answerable therefor it makes little difference as to the ownership.

Dissolution of Partnership

I have been in partnership for two years. We have now disposed of and divided everything except the livestock. I have offered to buy his interest or sell him mine on a fair and just basis, but he will neither buy nor sell. Is there any legal means by which I can bring about a settlement?—Subscriber, Los Angeles.

Yes, you may bring action for dissolution of partnership and in such action have an accounting taken and the assets of the partnership sold and divided.

Property to Survivor

When I bought my ranch the deed was made out in my name. At my death I wish my wife to have it all and she wishes to leave all to me should she die first. Now, how can we bring this about?—Subscriber, Fair Oaks.

There are three ways. First and best you and your wife can each make wills leaving the property to the other in case of death; second, the property can be deeded to a third person who can deed the property back to you and your wife, the deed reading in the name of you and your wife with the clause "as joint tenants with right of survivorship;" third, you and your wife can join in a declaration of homestead, whereupon, upon the death of either the property goes to the other. There are other methods, as each making a deed to the other, but as a deed is not valid until delivery and such delivery must be within the lifetime of the grantor, litigation frequently arises upon such methods.

Division of Property

A purchased some real property, taking title in his own name. A allows B to have half the land if B will pay half the money. On back of deed it was written by the notary that B should have a half interest in the land. B lives on the ranch and has stood all expenses such as fencing, clearing, building, etc., for the past three years. A does not live on the place and B has hired all work done. The understanding was that B should pay half of everything. Can B force A to divide land?—Subscriber, Orosi.

Yes. B should bring suit alleging a partnership between A and B in respect to the land, ask for an accounting and that the land which is the capital of the partnership be divided or sold and the proceeds divided. It is not necessary in an action of this kind that B have written evidence of his interest.

Dedicated to Public

I bought ten acres of land. It has a county road on the south line. The former owner verbally agreed to give ten feet on the east and west line for the convenience of parties living adjoining on the north. I want to fence to my line on the east and west. Have I the right to do so ? The parties to the north have deeded roads on their fronts and only use the roads along my line for a short cut to get south. One of them has been in use about eight years and the other about seven. —Subscriber, Orosi.

These cases rest so largely in evidence that it is difficult to give a definite statement, but it is quite probably true that your grantor has dedicated these strips along your land to the public for use as roads and that the public by their use thereof for a period of seven or eight years have acquired rights thereto which cannot now be defeated. If this is true you could not fence in. But as these cases frequently turn out unexpectedly it might be worth while for you to try it out.

CULTURE OF CITRUS ATTRACTIVE

In addressing the Kern County Farm Bureau in its recent meeting at Bakersfield Dr. Coit said:

"California citrus culture, among all horticultural industries, is peculiar in that the people who have built it up have been, in so many cases, retired business and professional men. Men who lost their health in the process of gaining wealth have bought and developed citrus properties, the management of which, by requiring life in the open sunshine and dry air, has resulted in renewed health and steadied nerves. These people brought the industry much needed capital, commercial habits and business ability.

"The result has been an industry characteristically American in spirit and new in methods. European methods are practically ignored in systems of cultivation, irrigation and pruning. In their readiness to organize among themselves along business lines and work together for the better picking, packing and marketing of the fruit, the California citrus growers are probably in advance of any other class of fruit growers.

"Citrus culture in California will always be a popular occupation because it appeals to a man from so many sides. It appeals to his love of the beautiful; beckons him to healthful outdoor life; stimulates that inborn desire in man to make things grow; satisfies his appetite and last but by no means least, it tempts him with offers of large financial reward. Successful citrus culture calls for a combination of the science and art of horticulture; requiring both skill and industry, it gives healthful occupation to the mind as well as the body."

THE FARMER'S WIFE—THEN AND NOW

Written for California Cultivator
By Mrs. Lee

With cackle and crow, at break of day,
The poultry call the farmer's wife,
And she must rise without delay
For hers is a busy life.
She feeds the ducks, she feeds the hens,
She feeds the farmer too,
She skims the milk, and feeds the pigs,
But yet she is not through.

She feeds the calf and the little chicks,
She milks the mooley cow;
Although it is cold and rainy too,
It must be done somehow.
The children must be washed and fed
And started off to school;
There is so much that must be done,
She has learned to work by rule.

Then there are dishes to be washed
And floors to sweep and scrub,
The washboard sings its merry tune
Of rub-a-dub-a-dub.
There is a garden she must tend,
And there's a baby too;
Although she hurries all day long
She never does get through.

But now, alas, she has rebelled,
She vows she'll work no more,
She'll neither bake, nor brew, nor mend,
Nor do a single chore.
She's off to town from morn till night,
She is the gayest ever seen,
She takes the children now to school
In a brand new limousine.

MUSHROOMS AND THE CARTER FAMILY

THE Carters had been distinguished for nothing in particular until Elizabeth, prowling among the shelves of the circulating library, happened upon a perfectly clean, new book. She seized it with delight.

"Why!" exclaimed Elizabeth. "A new book!"

"You see," exclaimed the librarian, almost apologetically, "Miss Gray, who taught here last year, accidentally carried off two of our novels. Instead of returning them, she had this larger volume sent to us direct from the publishers. It's a work on mushrooms."

"Who," asked Elizabeth, "wants to read about mushrooms?"

But because the book was clean, Elizabeth carried it home. From that day the Carters began to lead a new life.

The mushroom book was profusely illustrated. Every one of the family read the opening chapters with keen interest. Then out they sallied in quest of mushrooms. The entire family took part in the mushroom hunt.

Mr. Carter found the "giant puffball" growing unmolested in the stubbly field through which he passed every day on his way to work; and the bigger the puffball, the greater was Mr. Carter's joy. Mrs. Carter found the "fairy ring" flourishing, hitherto unnoticed, in her own back yard. Demetrius discovered the clustered caps of the gray "inky," or Coprinus atramentarius—Elizabeth insisted that everyone should use the Latin names, on the shaded path leading to the pond. Dorothy found scattered specimens of the smooth lepiota on the Deerton avenue lawns. To Lytle, the Carters owed the discovery of the spectacular "shaggy mane." As for Elizabeth, she fared forth to the forest; when she at last returned, the large basket on her arm contained no fewer than 49 varieties of fungi; some of these tallied obligingly with the descriptions in the book; others defied classification. Some were evidently edible, some doubtful, some impossible; all were interesting.

Thenceforth, mushrooms, fresh, dried, or decomposing, occupied most of the available surface in the Carter home. If you reached in the dark for matches, you encountered cold, clammy mushrooms. If you searched for a book, it rested under a choice specimen of fungi. If you wished to open the old-fashioned square piano, it was weighed down with Elizabeth's entire collection of 92 varieties. If you needed a box or a basket, it was already filled with Marasmius oreades, drying for winter use. Then, too, Elizabeth spent any spare moments in which she was not pursuing living specimens, in making "spore prints."

"You cut off the stem," said Elizabeth, in explanation of the process, "place the cap, gill side down, on a sheet of white paper under a cup or glass, and wait. The spores, falling on the paper, make a perfect print of the gills."

These prints, of course, occupied considerable space; and soon half the dishes in the Carter pantry were placed upside down over spore-shedding specimens. Moreover, the atmosphere of the Carter house became permeated with a musty, fungian odor, which was far from pleasant.

The Carters began, doubtfully at first, then with greater assurance, to prepare, cook and serve their mushrooms. Unfortunately, each member of the family remained loyal to the variety of his own discovery. Mr. Carter, for example, averred that no other fungus compared with the puffball. Mrs. Carter scoured her own and all the neighbors' lawns for fairy rings. Demetrius was loud in his praise of the gray inky and its little brown sister, Coprinus micaceus. Dorothy extolled the snowy lepiota, whereas to Lytle the shaggy mane was the only agaric fit for human consumption. These preferences, of course, rather complicated the task of preparing mushrooms for the Carter table. Fortunately Peter, the Carter cat, ate all varieties with equal pleasure—and equal impunity; so none went to waste.

As Elizabeth brought home new specimens every day, and as most of them, according to the book, were edible, the family experimented daily—sometimes three times daily—with broiled, fried, or stewed mushrooms.

The only time the Carters were made seriously ill was the day when Elizabeth cooked seven unknown varieties at once to serve in ramekins, as a side dish with lobster salad.

"I'm positive," asserted Mr. Carter, afterward, "that it was merely the lobster."

The Carters had always been hospitable. People had been accustomed to

Standard Oil Company
(CALIFORNIA)
Los Angeles

"drop in." There was always a "company place" at the ample table. It was now the chief delight of the Carters to serve mushrooms in variety to all their visitors. But that proved a short-lived pleasure, for, soon after the arrival of the book, the company chair began to lack occupants. Instead of "dropping in," the company dropped off. Moreover, faithful Jennie, who for many years had "come in by the day," began to make excuses for an alarming number of absences. Life with Jennie and life without her proved very different affairs. And Jennie would give no reason for her defection.

Of course the mushroom book "expired" and had to be renewed. The Carters took turns in drawing it from the library—their cards fairly bristled with the number 209. Still the fascinating mushroom held its sway; for each week brought new varieties, and every shower was followed by a more alluring crop.

Then came the news of Aunt Julia's impending visit. Aunt Julia was a personage. You received her in fear and trembling, you entertained her in perturbation, you drew long sighs of relief when the train, bearing her departing person, disappeared safely round the last visible curve. Then you waited for the letter that was sure to follow her departure. If anything about her visit had displeased her—and something always did—the candid lady never failed to mention it. And now, for the second time that year, Aunt Julia was about to visit the Carters; but, for once, the family seemed almost pleased at the news.

"I shall get up at dawn," announced Mrs. Carter, "to scour the country for fairy rings. So many other people are eating them now that it makes them harder to find."

"Never mind," said Mr. Carter. "There ought to be several big puffballs ready by now. She'll probably prefer those—they fry such a fine brown."

"I'll bring in all the lepiotas I can find along the avenue," remarked Dorothy.

Demetrius and Lytle said nothing, but no one was surprised when one brought "inkies" in a shoe box, and the other returned with "shaggies" in a yellow paper bag.

As for Elizabeth, she manufactured pickles from Clavaria formosa, the coral fungus; and she exhibited nine varieties of agarics that as yet had not been tried.

"So long as Aunt Julia doesn't know they're doubtful," said Elizabeth, "she'll be able to eat them just as if they were edible."

Before the visitor had removed her gloves, the momentous question was asked.

"Do you," inquired Mrs. Carter, "like mushrooms?"

"Why, yes," replied Aunt Julia without enthusiasm. "They're not so bad with beefsteak."

Mrs. Carter in all her dealings with her household, tried to be impartial. She could not serve Dorothy's fungoid offerings and slight those of Demetrius. So she finally evolved a menu that read as follows:

Shaggy-mane soup. (Lytle.)
Beefsteak, with broiled lepiotas. (Dorothy.)
Stewed inkies. (Demetrius.)
Potatoes, with fried puffballs. (Father.)
Pickled clavarias. (Elizabeth.)
Mushroom catsup, mixed varieties. (All of us.)

"I'll have to save my fairy rings for luncheon tomorrow," she said, with a sigh. "They keep better than any of the others."

Aunt Julia, although pressed on all sides, declined a second helping of any of the foregoing dishes, and ate rather sparingly of her first allotment; to tell the truth, her face assumed a slightly peculiar expression; but Peter, the cat, regaled himself afterward from her plate.

"I'm not hungry," explained Aunt Julia, accepting a third cup of tea, "but I am thirsty."

The visitor, who usually remained for at least three weeks, departed rather hastily after a stay of three days.

"But," said Mrs. Carter, when Aunt Julia announced her intention of leaving by the ten-o'clock train, "Elizabeth has at last discovered several fine specimens of the edible boletus—most of the boleti, you know, are considered poisonous—and we're going to saute them in olive oil for luncheon."

"Neverless," returned Aunt Julia, "I shall go at 10:00; and you needn't trouble to put up any lunch for me—I'll get something on the train."

The inevitable letter from Aunt Julia came in due time.

"When I said I liked mushrooms," wrote that candid lady, "I meant canned ones. No others are fit to eat. Moreover, as a topic of conversation, the mushroom has no interest for me. I am sending you a cookbook, entitled, 'Forty Ways to Cook a Cabbage.' Please use it. Affectionately, Aunt Julia."

Mrs. Carter learned that same day that Mrs. Blake, her next-door neighbor, was employing the missing Jennie.

"Why," asked Mrs. Carter, leaning over the fence to interview Mrs. Blake, "doesn't Jennie come to me?"

"She says she doesn't like your meals," replied Mrs. Blake, frankly. "She's afraid of being poisoned."

Two blows in one day, but that was not all. Aunt Julia, discovering suddenly that she had left her precious cameo brooch deftly hidden under the extra cake of soap in the washstand drawer, returned to rescue it.

The Carters, of course, apologized for their too lavish use of agarics, and assured the visitor that, should she stay, not a single mushroom would they serve—or mention.

"I'll stay for one meal," she replied, "but no more. I couldn't think of depriving you of your favorite food and your only topic of conversation. Besides, I've accepted an invitation for tomorrow."

"To tell the truth," confessed Dorothy, when the family sat down that night to an absolutely mushroomless meal, "I'd rather eat turnips than the finest lepiota ever grown."

"And I," said Elizabeth, "should like mushrooms if it were not for the mushroom flavor. It—it goes against me."

"I never did like 'em," declared Lytle, "but it's great fun to find 'em popping up all over the place."

"I pride myself on being able to eat anything," remarked Mr. Carter, "but I almost balked at mushrooms. It was only by exercising all my will power that I succeeded in downing those exceedingly slippery inkies."

"As for me," said Mrs. Carter, "you may have the dreadful truth. Perhaps you've noticed that Peter is always under the table at meal times. Well, I've never eaten a single mushroom—I fed all mine to the cat!"—Youths' Companion.

IDEAS FOR THE COOK

Written for California Cultivator
By Isabel Cottle

Breakfast

Ripe Oranges
Farina with Chopped Dates
Flannel Cakes
Ham and Potato Patties
Coffee

Lunch or Supper

Corn Chowder
Cold Roast Beef
Macaroni with Brown Sauce
Hot Buttered Beets
Roll Jelly Cake Tea

Dinner

Flank Steak, Braised Brown Bread
Cottage Cheese
Lettuce Hearts Tomato Mayonaise
Mince Pie Coffee

Flank Steak, Braised

Score a flank steak, dredge with flour, dot with butter and place in an oblong pan. Over this place a thick layer of thinly sliced raw potatoes; then a layer of thinly sliced onions; over the whole pour two cups stewed tomatoes. Cover tightly and place in the oven. Cook slowly two and one-half or three hours. One-half hour before the meat is done remove the cover and add a layer of boiled rice, more moisture if needed and cook uncovered the remaining time.

Flannel Cakes

Sift together two and one-half cups of flour, one-half teaspoon salt and four teaspoons baking powder. Add the yolk of two eggs beaten and mixed with two cups milk, and lastly the stiffly beaten whites of the eggs.

Macaroni with Brown Sauce

Break one-half package of macaroni into inch lengths, cover with boiling salted water and cook 20 minutes. Drain. Melt two tablespoons butter, add two tablespoons flour and when well browned add one cup stock, gradually stirring all the time, one teaspoon salt, one tablespoon grated onion and, if desired, one tablespoon tomato catsup and the macaroni. Cook over hot water 20 minutes.

Brown Bread

Mix well and sift one cup each, cornmeal, rye and graham flour, one-and three-fourths teaspoons soda and two teaspoons baking powder. Add one-half cup brown sugar, one-half cup molasses and two and one-half cups sour milk. Steam three hours, or one and one-half hours and bake one hour in oven.

RAISIN RECIPES.

Raisin Souffle.

Steam a cup of raisins until soft and plump, chop fine, add three tablespoons of powdered sugar, ten drops of vanilla and mix very lightly with the beaten whites of four eggs, in which have been whipped a pinch of salt and a quarter teaspoon of sifted cream of tartar. Turn quickly into a buttered dish, dust thickly with powdered sugar and bake in a quick oven 20 minutes. Serve at once with a soft custard made of the yolks of the eggs.

Raisin Pie.

Stir together one cup of cold water, one cup of sugar and one level tablespoon of cornstarch. Add the grated yellow rind and juice of one lemon, a cup of chopped raisins, and part of the lemon peel chopped fine. Cook until the cornstarch is well thickened, stirring constantly to prevent burning if a double boiler is not used. While this is cooling prepare the crust. Bake either with or without an upper crust. A meringue may be used occasionally for the sake of variety.

Steamed Raisin Bread Pudding.

Two cups of bread crumbs, one cup of New Orleans molasses, one cup of hot water on the crumbs, one cup of flour, one cup of raisins, one large teaspoon of soda dissolved in the hot water. Steam two hours.

Frozen Raisin Dessert.

Beat the yolks and the whites of two eggs separately and add them to three cups of sugar mixed with two quarts of sour skim milk and add this to three cups of plumped and chopped raisins. When partly frozen add the juice of two lemons.

Raisin Cookies.

Two cups sugar, one cup lard, two cups raisins, two eggs well beaten, one cup milk, two teaspoons baking powder and a pinch of salt, one tablespoon mixed spices and enough flour to roll nicely. Cut and bake.

Raisin Potato Cake.

One cup butter, two cups sugar, one cup mashed potatoes, one-half cup milk, one cup chopped walnuts, one cup California seeded or seedless raisins, one-half cup chocolate, four eggs, one-third teaspoon each cloves, cinnamon and nutmeg, two teaspoons baking powder. Bake in a medium oven.

Raisin Spice Cake.

Dissolve one teaspoon soda in one tablespoon boiling water and add to one-half cup molasses. Add one cup thick sour cream, one cup brown sugar, and three and a half cups flour. Beat thoroughly. Add one tablespoon each cinnamon and allspice and one pound California seeded or seedless raisins chopped fine and well dredged with flour. Bake in moderate oven one hour.

Raisin Sandwiches.

Chop fine a cup of seeded raisins and a cup of nuts, and mix them with the white of an egg, well beaten and seasoned with salt. Spread this between thin slices of buttered bread. Do not prepare until you are ready to use them.

Chocolate Raisins.

Chop fine some raisins and work into them a scant third of their weight in granulated sugar, using a few drops of strained honey to bind if necessary. Mold with the fingers into any shape desired and dip into melted, unsweetened chocolate. Lay well apart on waxed paper until firm.

Rhubarb and Raisins.

Add seeded raisins when stewing rhubarb and the result will prove a success.

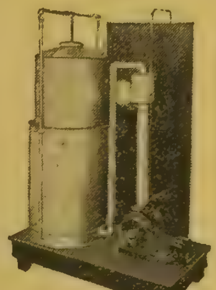
To clarify vinegar that is muddy or off color try adding about a teaspoonful of cream of tartar to each half gallon of vinegar.

Lessons in courtesy begin with manners at the table, with the salutations of the day, with the acknowledgment of thankfulness, and go on through all sorts of consideration and unselfish effacement and self-sacrifice to the very heights of prayer and praise. For religion, on its finer side, is the true courtesy of man toward God.—Dean Hodges.

It may be that what people mean by "good old times" is the neighborliness and human sympathy that was so apparent in those days old people so vividly remember. If that be true, let us revive the "good old times," that our days may be remembered.

To be free from evil thoughts is God's best gift.—Aeschylus.

The "OLIVER" Gas Generator



Unsurpassed for Simplicity and Economy

A 50-light plant for Cooking, Heating or Lighting, for $100.00.
Uses ordinary motor gasoline. No heat, or adjustments, required.
An even gas, under varying conditions, always on tap.
No trouble to install.
The least expensive, yet best, gas generator ever introduced.
A product of California.

Deafness

From All Causes, Head Noises and Other Ear Troubles Easily and Permanently Relieved!

Thousands who were formerly deaf, now hear distinctly every sound—even whispers do not escape them. Their life of loneliness has ended and all is now joy and sunshine. The impaired or lacking portions of their ear drums have been reinforced by simple little devices, scientifically constructed for that special purpose.

Wilson Common-Sense Ear Drums

often called "Little Wireless Phones for the Ears" are restoring perfect hearing in every condition of deafness or defective hearing from causes such as Catarrhal Deafness, Relaxed or Sunken Drums, Thickened Drums, Roaring and Hissing Sounds, Perforated, Wholly or Partially Destroyed Drums, Discharge from Ears, etc. No matter what the case or how long standing it is, testimonials received show marvelous results. Common-Sense Drums strengthen the nerves of the ears and concentrate the sound waves on one point of the natural drums, thus successfully restoring perfect hearing where medical skill even fails to help. They are made of a soft, sensitized material, comfortable and safe to wear. They are easily adjusted by the wearer and out of sight when worn.

What has done so much for thousands of others will help you. Don't delay. Write today for our FREE 168 page Book on Deafness—giving you full particulars.

San Francisco-Los Angeles Produce Markets

Los Angeles Market

LOS ANGELES, Dec. 2, 1914.

The prices given below, except where otherwise noted, are those made by wholesale or commission houses to retailers, and are intended to give producers the range of the market rather than an indication of prices which they will secure. Jobbers' quotations to producers are not given.

BUTTER

Heavy arrivals of exceptionally fine stock caused butter to decline heavily on Tuesday, and 5 to 6 cents was knocked off of the various grades.

Prices to trade 4 cents above following quotations:

Creamery Extras	30
First	28
Country	23
Ladle	22

CHEESE

Prices to trade, 1 and 2 cents higher:

California Fresh	14½@15
Imported Swiss	38@40
Eastern Daisy	18@18½
Longhorn	18½
Oregon Triplets	17@17½

EGGS AND POULTRY

Eggs are also declining, due in part to report from San Francisco that prices there are lower.

Prices to trade, 3 cents higher than following quotations:

Fresh ranch, case counts	43
Candled	47
Northern Case Counts	45
Petaluma-Santa Rosa	46

Prices to producers:

Hens, lb.	15@18
Roosters, old	9
Broilers, lb.	24
Fryers	20
Roasters, lb.	15
Turkeys	18@20
Ducks	18@20
Geese	17
Squabs, doz.	2.00

LIVE STOCK

The following quotations are f. o. b. Los Angeles on all stock:

Hogs, 175 to 200 lbs., per cwt	8.00
Prime Steers	7¼@7½
Heifers	6¼@6½
Calves, lb.	8½@9
Sheep—	
Ewes, head	4.50
Wethers	4.50@5.00
Lambs, head	4.50@4.75

POTATOES

Wholesale selling price:

Idaho	1.15@1.25
Sweets, lug	75@85

Citrus Fruit Market

LOS ANGELES, Dec. 2, 1914.

California's early navels are pleasing the eastern consumer. The quality is the finest ever and the quantity abundant. Unfortunately the easterner's money is not in such great quantity as desired and that factor with the other that Florida and the islands are sending in large quantities of fruit tends to lower prices. Good fruit is commanding around $1.50 and $1.75 f. o. b., which is not disastrous to the grower by any means, but considering the quality of the fruit the grower feels entitled to more. The best feature of the shipping lies in the fact that nearly all are holding up for the "eight to one" test. This means high quality and satisfied customers. Nearly all fruit has been from Tulare County, though some sections of Southern California have sent a little very fine fruit. Butte County's shipments have been light.

Lemons are very low. Arrivals from Mediterranean points are heavy. There are afloat at this writing 65,000 boxes, and one day's sales in New York recently aggregated 27,000 boxes at $2 or less. California's output is large, 15 to 20 cars daily, and of fine quality. Good stcok is commanding around $2.00 and $2.35 f. o. b.

Shipments

Shipments of oranges from Southern California since Nov. 1, 286 cars; lemons, 291; total, 577. To same date last season: Oranges, 38; lemons, 81; total, 119. Tulare County this season: Oranges, 897; lemons, 59; total, 956. To same date last season: Oranges 1704; lemons 11; total 1715. Butte County this season: Oranges 131 cars. To same date last season, 85.

NEW YORK, Nov. 30.—Six cars Valencias, two lemons sold. Market firm on both oranges and lemons. Cloudy.

VALENCIAS—	Avge.
Old Mission, xf., Chapman	$6.05
Old Mission, fy., Chapman	4.00

PHILADELPHIA, Nov. 30.—No California fruit sold. Cool, cloudy. Twenty-six cars Floridas sold. Market steady on good stock, declining on poor condition and quality oranges. Oranges sold $1.10 to $2.55; average, $1.85. Grapefruit $1.00 to $2.35; average $1.70.

BOSTON, Nov. 30.—Three cars oranges 2 lemons sold. Cloudy, cool.

Market stronger on oranges, unchanged on lemons.

CINCINNATI, Nov. 30.—Raining. One car lemons, seven cars Florida oranges, three cars grapefruit sold. Market advancing on lemons, steady on oranges and grapefruit. Florida oranges averaged $2.05, grapefruit $1.50 to $2.40.

Comet, Or. V. Park	$3.00
Reflection	1.90

Fails to Breed

I have a heifer, 17 months old, that I have bred four times and now she is in heat again. Have used different bulls. She is a promising heifer and in good condition. What can I do to get her in calf?—Subscriber, Laton.

Better skip a month or two and in the meantime if she is fat, reduce the feed. Give the following powders: Powdered gentian, four ounces; powdered nux vomica, two ounces; sulphate of iron, two ounces, and farina enough to make one pound. Divide into 16 powders and give one every night.

Hip Lameness

Have a lame heifer. Just before giving birth to her first calf, two months ago, she became lame in her hind leg. We called a veterinarian and he said there were no bones out of place. Advised blistering it and rubbing it with a liniment which he gave. She seemed better for a time, but is as bad as ever again and the flesh seems shrunken.—Subscriber, Santa Cruz.

The lameness may have been caused by a bruise over the joint or it may be tuberculosis, which sometimes locates in a joint. In any case hip lameness is hard to cure. If you do not value her too highly you had better not lose much time or expense in treating her.

Blood Poison

Two months ago a mare stuck a nail in her front foot about half way between the ankle and hoof. It seemed to only penetrate the flesh. We cleansed it as best we could, but in an hour it began to swell and pained her very much. We called a veterinarian and he opened and cleansed it. He came several times and lanced it in several places. It broke in other places until the leg, from knee to hoof, was one sore. We washed it twice a day with lysol, using a teaspoon to the pint of boiling water with a small piece of bluestone in it. It is healing very slowly and scabs over, but scabs come off, leaving it raw again. Her joints are not stiff and she limps very little. What would you advise doing for it? —Subscriber, Buena Park.

It is always best to change antiseptics occasionally because the effect of any one seems to wear out after a time. Make a solution of permanganate of potash, two drams to the gallon of water. Warm this and wet the parts once a day. As soon as it begins to dry so the scabs stick, grease it with bacon fat; that will start the hair if anything will.

Rheumatism

I have a heifer calf whose mother died within 24 hours after calving. I got the calf when it was two weeks old. It was lame in the middle or knee joint of the hind leg; said to have been strained. In a short time that joint and the elbow joint of the opposite front leg became swollen and very lame. I called a veterinarian and he pronounced it navicular disease, a form of blood poison. He prescribed tincture of eichonacea and bathing the joints with hot water. Thought it would die. The treatment seemed to increase the lameness, so stopped it. The calf is nine weeks old, lameness all gone, but joints still enlarged. Now a neighbor, who professes to have had experience with navicular disease, advises treating it by blistering, etc., or it will develop into tuberculosis. Is navicular disease a form of tuberculosis? And is it advisable to raise the calf? Or has it got some disease that will be dangerous to human beings?—Subscriber, La Canada.

Either you must have misunderstood the name of the disease or your advisers do not know what they are talking about. Navicular disease is inflammation of the navicular joint, which is only found in the horse's foot. The cow probably died of milk fever. The swollen joints of the calf were caused by rheumatism and, now that the lameness is gone, the swellings will gradually disappear. The calf will probably grow up all right and is as likely to make a good cow as any other calf. Keep the calf in a warm place at night and in the sunlight as much as possible during the day. It needs no treatment.

Scours

Have just lost two young calves, the first from a healthy cow fed on alfalfa and corn fodder. It was her sixth calf and the cow went 10 days over nine months. It commenced scouring the second day afer it came and died the fifth day. We gave it raw eggs and changed it to another cow, but nothing seemed to do it any good. The other was a heifer's first calf. We put it in the same barn, not knowing that there was any harm in it, and the next morning it began scouring and died the next day. We have never had abortion in our herd and try to be careful. The stable is new and no cattle were ever on the ground before. The calves seemed unusually hungry and ate as if almost starved. We have other calves older than these. Do you think there is danger of them taking the disease and what can be done for such cases? What is a good disinfectant to use? —Subscriber, Turlock.

The period of gestation for the cow is 280 to 285 days, so if they went over nine months, ten or a few more days, that was all right. The scours were probably due to a germ that the calves got from the dust on the cows' udders. Abortion and calf scours are caused by entirely different germs and both may or may not be present at the same time. You can probably get rid of it easily by using Zenoleum for a disinfectant. One gallon will last you a long time. Use a pint of it in four gallons of warm water to spray the stable. And when a cow comes fresh use the same strength of the solution to wash the udder before letting the calf suck. If the calf does get the scours then put a dessert spoon of the solution of Zenoleum in a little milk and drench the calf with it. Give this dose twice a day until the scours stop. Some may think this is not a very scientific preparation, but so far I have failed to find a better one.

SOME PEACHES

The William P. Stark Nurseries, of Stark City, Missouri, are issuing a peach of a catalog. The peach on the cover looks good enough to eat and the catalog touches upon peaches of practically all varieties, but especially the J. H. Hale. In addition, of course there are apples and pears, apricots and plums, and a thousand and one other items. The cover is handsome enough to frame and we doubt not the booklet will meet with a keen demand. We believe a post card to Mr. Stark, with note of the fact that the Cultivator has mentioned the catalog, will be all that is necessary to obtain a copy. The peach grower will find it filled with information.

J. H. HALE'S Peach Wonder
—Stands Shipping Like Apples

Enormous Size—Round Shape—Firm, Solid Flesh
Ideal for Drying and Canning — Late Bloomer
The One Great Peach for Western Growers

All Most Wanted Qualities

In size the J. H. HALE peach is like a small cannon-ball, ⅓ to ½ larger than Elberta; weighs 12% more; color, a deep golden yellow, overlaid with carmine; skin, practically fuzzless, like an apricot; globular shape, excellent for canning; flesh firm and fine-grained—solid as a cling, yet perfect freestone; fruit ripens five days ahead of Elberta. Colors up a week to 10 days before maturing, allowing extra early picking. Owing to solidity of flesh, matured specimens can be allowed to hang on trees a week or more, extending the season at both ends.

Perhaps the greatest feature of the J. H. HALE peach is its shipping qualities. Specimens have been shipped from Connecticut as far distant as Florida, California and Texas, where they were kept 10 to 18 days after they were received. The J. H. Hale is solid enough to pack and ship in barrels. As a western grower you must realize the tremendous advantages such a peach holds for you.

Mr. Hale Made $1420 per Acre

From his Conecticut orchards Mr. Hale received at the rate of $1420 per acre from his J. H. Hale peaches. From his Georgia orchards his J. H. Hales paid him 33% more profit than his Elbertas, grown side by side. Reserve your trees NOW. Supply limited.

No Agents—Save ½

Our catalog is our only salesman. We have no agents, no solicitors. Thus we save you ⅓ to ½, and you are sure of getting what you order. All trees doubly guaranteed true to name, healthy, well-rooted, and vigorous—famous Stark-Ozark mountain-grown.

120-Page Book Sent Free

Prices in plain figures. Lists all worthwhile apple, peach, pear, plum, apricot, quince, cherry trees, grape, currant, gooseberry, raspberry, blackberry, roses, shrubs and ornamentals. Mail the coupon below and get advantage of direct-from-nursery prices.

Caution! Beware of Fraudulent Trees!

The wonderful success of the J. H. Hale peach and the demand for it has tempted dishonest persons to imitate and deceive. An old, worthless peach known as "Hale's Early," is being offered as the true J. H. Hale. Refuse fraudulent trees! You can get genuine J. H. Hale trees, budded from Mr. Hale's bearing orchards, only from Wm. P. Stark Nurseries, Stark City, Mo. Genuine J. H. Hale trees bear wooden tag with Mr. Hale's personal signature, as shown below. Read our exclusive contract with Mr. Hale in our catalog.

We ship direct to California customers. Our trees pass all requirements of inspection laws. Safe delivery guaranteed.

Some of the Buildings on Kearney Vineyard

The University of California Has a Great Property in the Kearney Vineyard Estate at Fresno. This Property Came to the University Heavily Encumbered but Through Business Management the Mortgage is Now Practically Lifted. This Property Will Some Day be a Great Educational Factor in the Work of Our State University. Article Regarding the Possible Future of This Property by Dr. Thos. Forsyth Hunt in This Issue.

The Ideal 40 Acre Farm

The Land Lies Ready for the Plow and Near Two Railroads

Wheat Standing Five Feet High.

Full Bearing Olive Grove Shows What Is Being Done Within the Tract.

Transforming the Plains Into Orchards

From the bare land, to the wheat field, to the aristocratic olive or citrus orchard; and even to avocados—such a transition is the work of pioneers with clear sight toward an old age of comfortable competence—such a transition is going on in the undulating plains north and east from Marysville. The planters of olive orchards and fruit trees there today are the horticultural leaders of tomorrow, for the soil is right, the drainage is right, the irrigation is simple, the climate is right and the class of people who undertake such a transformation is the sort that can cooperate to market right.

Here is a district of many thousand acres of deep loamy soil underlaid by water-bearing gravel in which the water table can scarcely go below 25 feet. With the Feather and Yuba Rivers within a few miles a constantly available supply of water is assured at such a depth that a pump on top of the ground supplies sure irrigation. A well now being bored shows a depth of 40 feet of sandy loam and 40 feet of continuous underlying water gravel, the water level coming to within 15 feet of the surface. Such conditions are ideal for irrigation by pumping.

Two railroads, The Western Pacific and the Southern Pacific, furnish transportation in competition with the water routes.

The land is gently rolling with just enough slope for drainage, it lies ready for the plow and the wheat crop—**no clearing to do, no brush to handle** or stump pullers to buy. Nature has left this land clear, clean, above all danger of floods, and the ideal homesites for thrifty California farmers who desire to make immediate headway under most favorable conditions. Within a radius of five miles may be found almost all kinds of fruits, grain and vegetables. Here, too, are some 40 and 50-year-old fig and apricot trees and still bearing fruit. Here, also, cucumbers are grown which reach the S. F. market the first of the season.

The central picture, taken last July, shows what the land in this district can do when planted to wheat. It grows luxuriantly five feet high and thickly stooled out. The crop from this field of 1200 acres the past season was enormous,and it had never been fertilized or irrigated. Whereever irrigation water has been applied even in most limited ways by windmills or small pumps the results are astounding.

The lower picture, showing an old olive orchard on the same tract, proves that this fruit and any others which thrive under similar conditions, are favored and encouraged by the climate.

This, the final step in the three stages which are already proven on this tract, an orchard that will be yielding more and better fruit for your grandchildren than for yourself, an orchard that yields good commercial returns with five years from planting, **is within your reach.**

A large tract of this fertile soil in a favorable climate, with plenty of available water and good drainage, and no alkali, is being sold in forty-acre farms. Orchard trees are furnished for the planting of nearly half of the farm. Grain, corn, beans and other seed are furnished for the rest of the land to provide a quick income. Wells and pumps are installed for irrigation and home use.

All kinds of vegetables and poultry thrive—the living expenses may be reduced to a minimum by having a garden, poultry yard, and perhaps a cow.

There is immense satisfaction in growing up with the country, in transforming fertile plains into grain fields, and orchards, and home, amid neighbors whose interests are the same as yours. Land values in upper California are increasing constantly but normally as new homeseekers are developing the country and there is every assurance that this land will be doubled in value within a few years.

If you are desirous of locating on one of the best 40-acre farms in the state—on new, clean land, or if you know of any friends in the East who want homes in California I want to send both of you information on California farm lands—and values—**which every homeseeker should have.** A post card will bring it.

Investigate and see this land for yourself before you buy.

THE PRICE $150.00 PER ACRE INCLUDES

A MODERN PUMPING PLANT COMPLETELY EQUIPPED AND INSTALLED. A SELECTION OF TREES AND SEED BEST SUITED TO THE LAND, NECESSARY FARM IMPLEMENTS FOR IMMEDIATE WORK.

Best Methods of Lighting the Farm Home

J. B. Neff Investigates Different Methods of Lighting and Gives His Findings as to Electricity, Gasoline and Acetylene. There is No Reason Why the Farm Home Should Not Have Practically Every Convenience Available to the Home in the City

A WELL lighted house is much more cheerful than one with poor lights, and a good modern lighting system is safer as well as much more convenient than oil lamps, though the oil lamps which we know were a great improvement over the tallow candles of 60 years ago. Small independent lighting plants can now be bought and installed at such reasonable figures that almost every one can have good lights, as well as other conveniences which may also be used in connection with the lighting system, such as cooking and heating appliances with acetylene and gasoline, and electric fans, irons and vacuum cleaners with electric plants. However it must not be supposed that a small private lighting plant will furnish light as cheaply as lighting plants that are built to supply a city. Neither will it be as convenient to take care of the small plant as it will to turn on the light from the large plant when wanted.

Acetylene

Possibly more acetylene lighting plants are used than of all other kinds. This is because of the low cost and easy installation, as plants capable of furnishing 20 to 50 lights can be bought for $150.00 on board cars at Los Angeles or San Francisco. Piping an ordinary eight-room house should not cost more than $20.00, and the fixtures can be bought for $40.00, or as much more as the buyer wishes. The light will cost about two-thirds cent per hour for 16-candle power light when carbide costs five cents per pound, as at present, but that cost is likely to be reduced as soon as shipments are made by the Panama canal. The cost of cooking is rather high when compared with other fuel and is about the same as coal gas at $1.50 per 1000 feet, or from two cents to five cents per hour for each burner. Considerable is often said about the safety of acetylene gas but with proper installation there is very little danger if ordinary care is taken. The generator should be placed outside and fifty feet from the house if possible, in a small, well ventilated building which is used for no other purpose. All filling and cleaning should be done by daylight, and artificial lights such as candles and oil lamps should not be brought near the generator. There is but small danger from leaky pipes as the odor of the gas is so pungent that a leak will be detected at once. Among the safe generators is one that drops the carbide particles into the water automatically as needed, instead of dropping water on the carbide.

Gasoline

Gasoline gas lighting plants are not as common as they should be for farm house lighting when the advantages in cooking and heating are considered. The machinery of the plants is simple and long-lived and the cost not excessive. More care is necessary with the piping for gasoline gas than for acetylene as the pipes must not have traps or low places between the burners and the gas machine. There will be some condensation of the gas during cold days and gasoline would gather in these low places to the damage of the lights. Gas machine gasoline of 80 degrees to 87 degrees test must always be used and not the gasoline commonly used in automobiles, as this sometimes is as low as 56 degrees and will not make good lighting gas. Gas machine gasoline costs at present 35 cents per gallon in 50-gallon drums, but as five gallons of gasoline will make 1000 feet of gas and an incandescent mantle burner will consume only two and one-half feet per hour the cost for light is not excessive. A 16-candle mantle burner will cost about one-third of a cent per hour for light. The burners used for cooking vary from a cost of one cent per hour to three cents per hour. For heating the cost will vary according to amount of heat needed but will be from one cent to five cents per hour.

Gasoline gas machines, including all that is necessary except pipe and fixtures for the house will cost, freight paid to Los Angeles or San Francisco; for 15 light machine, approximately, $220.00; 20 light machine, $245.00; 25 light machine, $265.00. The machine should be placed in an isolated building a little distance from the dwelling. The piping will cost the same as for acetylene and the fixtures may cost according to the wishes of the purchaser.

Electricity

This is the modern light and is a luxury at a low cost when it can be had from a power company or the city lighting company, but because one is not located so as to be able to get his light "ready made" he need not be deprived of the comfort of electric lights. There are various styles of generators, but that which has the engine as an independent machine is the most convenient since the engine can be used for other purposes, such as pumping water, sawing wood and doing the family washing when not needed for running the generator. The cost of complete equipment, including generator, switchboard and storage battery, but not including engine, for twelve 40 watt tungsten lamps (32-candle power) continuously, or five 40 watt lamps seven hours from storage battery will be about $300 on board cars at either Los Angeles or San Francisco. The same equipment with storage battery sufficient to carry eight 40 watt lamps six hours will cost an additional $35. A two and one-half horse power gas engine costing $75 to $80 is amply large to furnish all the power needed. These equipments are readily installed and once in place are not liable to need expert service. They are low voltage plants and are safer than high voltage but require larger wires in the buildings than the high voltage. The cost of light from such a plant will be 15 cents to 20 cents per kilowatt hour, or one cent per hour for each 40 watt, (32 candle) tungsten lamp. Tungsten lamps of 10 watts to 40 watts are sold for 30 cents each, but lamps of suitable voltage are not kept in stock west of Chicago at present. However, a supply of a half dozen extra lamps is all that will be needed in a year, and a new supply can be had in ten days. The storage battery will last from three to five years and is not expensive to replace. Wiring an eight-room house will cost $20 to $25 and the lights and fixtures from a few dollars to any amount desired.

The Kearney Ranch

A Possible Unit in California's Educational System. A Great Property Which Will Some Day be Used to Advance Education by the University of California.

Extracts from an Address by Dean Thomas Forsyth Hunt, Some Time Ago at Fresno

IN an address before the Commercial Club of Fresno Dean Thomas Forsyth Hunt of the state agricultural college spoke of the great Kearney vineyard property which was bequeathed to the state university by the late Theo. Kearney. There are so many interesting points in Dean Hunt's address that we quote:

The first time I ever heard of the Kearney ranch, at least in its relation to any educational program, was in New York city two years ago last July. President Wheeler had been kind enough to ask me if I would come to California. How kind he was being to me I did not at that time fully appreciate. Among the many things the president had to talk about was Mr. Kearney's will and the proper use and development of the great property bequeathed to the regents of the university.

Almost, if not quite the first time I saw the president after going on duty in this state, he said: "What about Kearney ranch?" I said "Mr. President, I am new to your state, ignorant of your local conditions, and besides I have other things to do which for the moment need my full time. The Kearney ranch is now being conducted satisfactorily by the comptroller as an income bearing property. I suggest that conditions be allowed to remain as they are until I have had time to study the situation. Some day I will come to you with a program for the development of the Kearney ranch." At various times since, President Wheeler has discussed this subject with me. He has not only expressed the most profound interest and sympathy in the future development of Kearney ranch but has felt sincerely concerned, because of the necessary delay.

So far as the last two years are concerned, I accept all the criticism or blame that may be attached to the delay. The plan is to make the Kearney ranch a very important and integral part of the greatest institution in the world for research and instruction in agriculture, horticulture, forestry and allied topics. Naturally no definate steps could be taken by anyone until the man, for the moment, im-

(Continued on Page 595.)

The Cost of a Telephone Call

DID you ever think how much it costs to give you the telephone right-of-way anywhere, at all times?

Your telephone instrument, which consists of 130 different parts, is only the entrance way to your share of the vast equipment necessary in making a call.

Your line is connected with the great Bell highways, reaching every state in the union—with its poles, copper wire, cross arms and insulators in the country; its underground conduits, manholes, cable vaults and cables in the cities.

You have the use of switchboards costing upwards of $100,000,000. You enjoy the benefits of countless inventions which make possible universal telephone talk.

Your service is safeguarded by large forces of men building, testing and repairing lines. You command at all times the prompt attention of one or more operators.

How can such a costly service be provided at rates so low that all can afford it?

Only by its use upon a share-and-share-alike basis by millions of subscribers, and by the most careful economy in construction and operation. A plant so vast gives opportunity for ruinous extravagance; and judicious economy is as essential to its success as is the co-operative use of the facilities provided.

That the Bell System combines the maximum of usefulness and economy is proved by the fact that in no other land and under no other management has the telephone become such a servant of the masses.

Citrus and Tropical Fruits

IMPROVEMENT BY BUD SELECTION

(Concluded from Last Week.)

THE practical orange performance record method used by the National Orange Company of Riverside in securing individual tree records in their extensive orchards is submitted for the consideration of citrus growers. This method includes the number of full boxes, and the weight of part boxes of oranges borne by each tree, and any notes as to quality of fruit that may be advisable.

In carrying out this method the ordinary system of picking must be reorganized to meet the conditions. The picking boxes are distributed to individual trees, instead of in box rows as is usually the case.

Each picker picks an entire tree instead of only the top or bottom sections. One man in each picking gang arranges the boxes in position at the base of the trees, brushes out all dirt from the boxes, and levels off the fruit in the filled boxes so that all boxes contain about the same amount of oranges. This man also carries a small handspring balance, with two chains attached which hook into either end of the picking box. The part boxes of fruit are weighed with this balance, and the average box tare (11 pounds) subtracted from the total weight, thus giving the weight of fruit in the partly filled boxes. If there appears any striking off-type fruit, such as Australians, yellow navels, golden nuggets, ribbed, corrugated, sectional, pear-shaped, rough or others, a note of this fact is made under the heading of quality along with the other tree data. Also any information of value, such as the presence of scale, gopher injury, dead wood, on such trees is noted in connection with the individual tree record.

These forms are arranged in books four and one-half inches wide by nine inches long, a convenient size for carrying in the pocket. Each form provides for records of 80 trees in a row. This number, in other orchards might be modified to meet orchard conditions, if the number of trees in each row is less or greater than 80.

In addition to the valuable data thus secured by the use of this method, it has been found by experience that the rate of picking is increased and the care in handling the fruit is improved. In other words, individual tree picking promotes the efficiency of the individual picker and increases the care in handling, from the fact that in this system each picker's work is open to continual inspection ond comparison. It is the most effective means yet devised for putting into practice the principles of efficiency and careful handling that underlie successful orange picking.

The annual data is collected in forms providing for several years' records. The number of trees in each sheet can be arranged to suit individual conditions.

Drone Trees

There is a marked variation in the amount and quality of fruits borne by individual trees of the same type. This variation must be clearly distinguished from type variations. For instance, in the standard type of the Washington navel orange we have found individual trees bearing consistently large crops of high grade fruit of the best commercial sizes, while other trees bear low yields of inferior quality. These low yielding trees have been called drones from the fact that they require as much attention, expense and care for maintenance as the profitable trees, without conmensurate returns.

An inspection of the average performance records (for the seasons 1911, 1912, 1913 and 1914) from ten best producing and ten lowest producing standard Washington navel trees, located in one of the best navel orange groves in California shows that the best trees have produced an average of 25.2 per cent more of the most valuable sizes, 200's to 80's inclusive, than the poorest trees of the standard type. The best trees have produced an average of 12.3 per cent more of first or orchard grade fruit than the poorest trees. We have found that by rebudding we have been able to replace the poor indivdiuals, with an hereditary tendency to produce few and poor fruits, with tops that produce the larger yield of better commercial grades and sizes of fruits.

The best produced an average of 663 oranges or 4.04 packed boxes, while the poorest produced an average of 182 or .95 packed box of oranges per tree, or a difference of 481 fruits or 3.09 boxes per tree. Figuring this difference to the acre basis at the rate of 80 trees per acre, the actual rate of planting in this grove, it amounts to 247.2 boxes per acre. The actual value of this difference is at the rate of $417.77 per acre f. o. b. packing house. Can we afford to ignore these facts? The best trees produce at the rate of $546.21 and the poorest $128.44 per acre, f. o. b. packing house.

Individual Tree Knowledge

The importance of individual tree knowledge cannot be overestimated. That it should have been largely overlooked in the past is all the more reason for attention to this phase of citrus culture now. We have had a large number of visitors who desired to see for themselves the nature of our work along this line, and we are always glad to show our methods, so far as our time permits. We have had many comments from notable authorities giving their opinions as to the importance of this individual tree investigation, amongst which the following from Professor P. G. Holden, a man of international fame who has been of great service in the advancement of agricultural knowledge and practice, particularly in the improvement of corn production, is typical.

"I know that you are on the right side with the improving of citrus fruits. There has been a common impression among not only the common people but among scientists who should have known better, that a graft was simply a graft, and that there was no opportunity for improving by selecting some prolific branches or trees. In many respects, I believe that the opportunity for advancement and improvement are much greater with the budding and grafting method than with seed, although I am satisfied that the same general principles hold true to a much greater extent than has generally been supposed."

The ideal which we have in mind is the bringing up of the individual tree production to that of the best trees in the grove. We believe that this ideal is possible of realization and that individual tree knowledge will be the means through which this achievement can be accomplished.

PRUNING THE OLIVE

Our Australian friends are advancing rapidly in the production of orchard fruits, and very much along the same line as is California. We note the latest publication, Olive Culture, by the department of agriculture of New South Wales, from which we quote from the chapter touching upon pruning.

"This important branch of work has been very much neglected in many districts where olives have been planted, as the growers are of opinion that this tree does not require pruning. If the olive receives regular annual pruning, either light or otherwise, according to the growth which the tree has made, it will be found that the trees will crop more regularly than where they are left to their own sweet will, when they usually crop every other year.

"The trees should be pruned every year, but it will be found that some varieties require the knife more than others. This work is best done as soon as the crop is disposed of, or not later than the first of August.

(It must be remembered that this was written for orchardists in the Antipodes where the month of August corresponds to our month of February.)

"The object in pruning should be to keep the tree just so open that it can develop fruiting wood all through the tree, as well as to keep it from growing too high, as the lower the tree is the more easily the fruit is picked. Therefore, from the time the tree has attained the height of four or five feet, the pruning should commence with these objects in view, viz., to keep it as low as possible without too many main branches, and with the fruiting wood distributed evenly through the tree. The olive bears its fruit on wood of the previous year's growth; the problem, therefore, for the pruner is to regulate the number and kind of branches on the tree so that only a sufficient number of wood branches are left to shape the tree, and to subsequently furnish a place for fruit branches. It is found that the vertical branches are practically sterile, while the horizontal branches bear the fruit.

"No hard and fast rule can be laid down for each tree or kind, as one tree may require to be severely cut, while another may only require a little pinching back. If the tree is too thick in the center, no fruit will set inside—in fact, no fruit will set where the sun and light (which are the principal agents of fructification) cannot penetrate freely.

"I would recommend the vase or goblet shape for those who are growing olives, as by this system scale diseases are more easily kept in check and the fruit ripens more evenly and earlier. The lower and drooping branches may be allowed to grow downward until they almost touch the ground, as these shelter the friendly ladybirds and produce good fruit which is easily harvested.

"The Nevadillo Blanco is a sturdy low-set tree with a large fruit bearing capacity—within reasonable distance from the ground.

WILD CITRUS FRUITS OF MADAGASCAR

By Consul James G. Carter, Tamatave

Citrus fruits grow in a wild state in Madagascar, though in the center and on the east coast of the island oranges and mandarins are grown in small quantities from planted trees. Oranges and lemons ("voasary" in alagasy), of no fixed varieties, are most common on the east coast, and are found either near the shore in sandy soil or more in the interior in compact soil, more or less flinty or rocky, and, as a rule, poor and arid.

The trees do not grow in the shade of forests, but are scattered among bushes, usually next to guava and "voavontaka" (Strychnos ipenosa) trees. The quality of the fruit, excepting the lemons, is generally poor. The better varieties, however, have been introduced.

There is an orange tree (Citrus aurantium) on the west coast, which grows 8 to 10 meters (26¼ to 32 4-5 feet) high. The fruit is ordinary, contains little juice, and is attacked by a small larva which eats the pulp. The tree is also attacked by a larva or moth which devours the leaves completely.

A small lemon ("voasary makirana" in Malagasy), about the size of a hen's egg, also grows on the northwest coast. The tree of this fruit is about 4 to 5 meters (13 to 16 2-5 feet) high.

On the east coast there are two local varieties of mandarins (Citrus aurantium, var. nobilis), and one imported from Zanzibar. Grapefruit or shaddock (Citrus decumana) of an imported variety is found on the east coast.

Semitropical fruits, such as mangoes, figs in small quantities, papayas, pomegranates, etc., also grow in Madagascar, but not in a cultivated state, except at the experiment stations at Tamatave and Nanisana, near Tananarive.

Deciduous Fruits

SOME PEAR IDEAS

Written for the California Cultivator
By Sacramento Valley Contributor

PEAR blight has caused a loss of many thousands of dollars to the fruit growers of America, yet both practical pear men and scientists agree that with the knowledge we now have of the disease it is quite possible to control it.

Pear blight is a bacterial disease of the sap of the tree. There is no remedy yet known for the disease, that is, no medicinal or other means of attacking the germ in the diseased tissues and killing the infection so that the tree may grow new tissue in place of that which is diseased.

Nor does there seem to be any way of protecting trees from the infection except to see that all the blight in all of the pear and apple trees in the neighborhood is cut out, so that bees or flies or other insects have access to no diseased tissue from which to bring infection to the blossoms or other parts of clean trees.

When a tree is infected the disease germs pass up and down in the inner tissue of the bark, destroying the tissue, literally blighting it. It makes most rapid progress during the spring, warm moist days when sap is flowing freely being particularly favorable to its spread. Twigs and limbs that are affected have the appearance of having been burned by fire. They are dried and the leaves are black and dead—hence the name "fire blight" sometimes applied.

The one means of combating the disease is by cutting off or out the affected tissue, disinfecting the tools used after each cut made. This seems very simple and it is absolutely effective as has been demonstrated. All that is required is to first know the blight—which is easy—then it is a matter of attention to detail, scrupulous care and keeping everlastingly at it.

This lack of attention to the simple detail of disinfecting the tools after making each cut often continues the spread of the disease and by reinfecting each fresh cut defeats the purpose for which it is done. The affected twig or limb must be cut back to healthy tissue and that which is diseased destroyed. If the disease is in the trunk or roots all diseased tissue must be chiseled away. And every time a cut is made the shears or chisel or knife must go into the disinfectant and the cut made should be disinfected, but the disinfection of the cut —which is healthy tissue— is less important than to thoroughly clean the tools each time. Disinfection is accomplished by use of kerosene or a strong solution of bichloride of mercury. A pail containing the liquid is carried by the operator, the tools dipped in the pail after each cut and kept in it while going from tree to tree.

Owners of extensive pear orchards have found it practically impossible to hire men who will follow absolutely this rule about disinfecting tools and this is one of the causes of the great loss from the disease.

Another important consideration in connection with blight is to keep the small twigs and shoots pretty well trimmed off the main limbs and trunk of the tree. Infection here is more serious than in the tip ends of the branches because every square inch of surface chiseled off stops some of the circulation of the tree, and if the infection circles the trunk the tree is quickly killed.

Another thing to avoid as much as possible is cutting the trees when they are growing vigorously. Severe pruning at this time makes lots of young new growth and this is especially liable to infection. Heavy cutting of infected tissue during the free run of sap and during the early summer can be avoided to a great extent by carefully cutting out all infection during the winter while the trees are dormant.

AMERICAN POMOLOGICAL

The American Pomological Society is a voluntary incorporated organization of men and women interested in the development of a continental pomology. To this end the society holds biennial meetings for the consideration of papers and reports upon the leading live topics of the industry; for the discussion of the merits of new or little known varieties of fruits; for deliberations as to the values of varieties for specific locations and uses; for debate upon proposed or pending legislation covering questions bearing upon national or continental pomology; for the determination of problems in nomenclature—the correct naming of varieties of cultivated fruits. In its efforts to accomplish these and other ends it uses as a means of stimulus the income from certain bequests made years ago by its first president, Marshall P. Wilder, in the form of medals and awards of honor and merit. Among the particular offers of this character is the Wilder silver medal offered the originator or introducer of a specifically meritorious new fruit.

A number of lines of active work are at present being pushed by the society, among which are the effort to establish a national score card for judging of competitive and educational displays of fruit; the inauguration of a standard system of nomenclature; the establishment of a permanent home for American pomological interests; cooperative effort in behalf of uniform national pomological and

horticultural legislation; cooperation in international effort to the end that system, order, simplicity and integrity prevail in the world's work in pomology. In truth, the American Pomological Society stands for better fruit, better fruit growing and a better fruit grower for the American continent.

The society's publications consisting of the bulletin, regular and special reports, are mailed to all members and not to others except on vote of the organization. Today the reports of this society are the most important and valuable contribution to American pomology, for they embody a complete history of the essentials of its progress for the past 60 years. A full set of publications for a period of two years is available to any person for two dollars; a set of all past reports yet in print, together with all others during life, are likewise available to any person paying $25. Single copies of any available past report, two dollars to others than members.

The annual meeting will be held in Berkeley September 1-3, 1915.

A NEW KIND OF FIG

Written for the California Cultivator
By Dr. J. A. Munk

In my botanical garden near Compton I have been experimenting for several years with eastern trees, shrubs and plants, to find out how the change to California soil and climate affects them. I am using seven acres of land for this purpose and can later on extend my ground as occasion may require.

In 1906 I began planting a grove of deciduous shade trees that I started mostly myself from seeds and cuttings which have done remarkably well, some of these trees having grown in that time into large forest trees eighteen inches thick and seventy-five feet high, with foliage so dense as to make an unbroken shade.

I also planted at the same time a small orchard of deciduous fruit trees and among the trees are several kinds of figs. Four years ago I planted together some cuttings of the black African and white Kadota figs to start more new trees for replanting. When these cuttings began to produce fruit I noticed that the figs on one of the little trees were different from the others. This discovery aroused my curiosity and caused me to take the tree under observation.

The fruit is neither of the black nor white varieties of figs, but is seemingly a combination of the two, being mostly white, but showing pale, pink spots and stripes on the skin. The shape of the fruit is also different, being decidedly bell-shaped and of good size and flavor. It is thin-skinned and the meat is of a delicate lemon-yellow, instead of being either red or brown, as in the case of the two varieties before mentioned. It is very sweet and when fully ripe tastes like nectar.

The shape of the tree is low and bushy, on the dwarf order, with branches starting from near the ground. The tree now, at four years of age, is ten feet high and 12 feet wide in the middle.

The first fig crop of the season is insignificant or entirely absent, as the yield of fruit is small; but the second, or real crop, is always sure and large in all varieties. My new fig, however, has the advantage of a longer season, lasting from the first of August until the first of December. It thus produces its luscious fruit during four full months as against two or three months of any other kind.

The cross evidently came from planting together the two varieties of cuttings, as before described; but how they managed to originate a new variety of fig is a mystery. Its history seems to be similar to the introduction of the Carolina poplar, as its origin is equally mysterious and unexplainable, that resulted in the crossing of our native cottonwood with the black poplar of Europe.

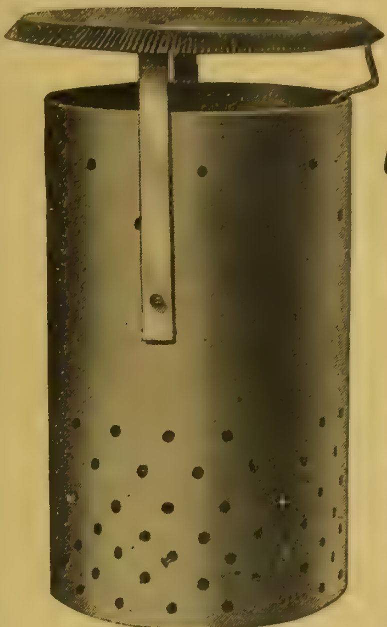
NUT PLANTING

Mr. Elmore Chase of Fairoaks, Sacramento County, writes:

"This section of California bids fair to be one of the nut growing portions of the state. Almonds have long been one of the standard commercial crops, and under the protection of the Almond Growers' Exchange is now one of the most profitable. Preparations for growing on a larger scale the English walnut are now being made since the new French varieties have shown such good producing qualities of superior nuts and are nearly if not quite immune to blight. The Mayette (Kerr), Franquette, Parisienne, and the Meylan are claimed have less than one nut blighted out of 2000. It seems that the Franquette is a promising nut, and some of the strains are especially excellent.

"But the pecan seems to take the lead in interest among nut growers. There are several trees growing in this place. Mr. Rixford of the bureau of plant industry has arranged to have introduced here 50 pistachio trees. The selling price at retail of this nut in Sacramento is five cents an ounce. Mr. Rixford has great faith in the success of this species of the nut family.

It is easy in the world to live after the world's opinion. It is easy in solitude to live after our own. But the great man is he who in the midst of the crowd keeps with perfect sweetness the independence of solitude.—Emerson.



The Chamberlain Orchard Heater for Immediate Delivery

The most efficient means of fighting frost. Burns coal, producing a radiant heat where it is needed. No sooted fruit or spilled oil in your orchards. No tanks or other special equipment required.

HOW TO PRODUCE A PAYING SUGAR BEET CROP

Written for California Cultivator
By Percy L. Edwards

HAVING discussed at some length in a former paper the selection and preparation of the land best suited to produce a paying crop of beets, we now come to the care necessary in caring for the "stand." If the advice has been followed, the young plants may be assumed to be well bunched in the rows. Looking over the field after ten days from planting the seed, the rows should be well defined and easily traceable over a 20-acre field. It may happen however that a recent heavy rain, followed by hot weather, has caused a crust to form and thus prevented much of the seed from coming to light. This condition may be easily ascertained by breaking the soil where no plants are seen. The small shoots will show a bent-over appearance from the pressure. The plants are so delicate at germination that they cannot penetrate a hard crust. A patchy condition of the field is very often due to this. This condition should be immediately remedied by running a light harrow over the field crosswise of the rows in order to break the crust and let the sprouting beets through. Do not fear that you will injure your field in doing this; you will better it.

THOROUGH CULTIVATION WHEN THE CROP IS YOUNG PREVENTS CHOKING BY WEEDS, SAVES MOISTURE, INTRODUCES AIR TO THE SOIL, MAKES MONEY FOR THE FARMER

—Courtesy Planet, Jr.

At the formation of the second leaf on the young plants begin running your cultivator, one horse or two horse, down through the rows with weeding knives attached so as to cut the ground very shallow but as near the growing beets as possible and not cut them. This first cultivating is more for the purpose of killing the weeds before they get started than for any other purpose. It is important that the grower of sugar beets keep the weeds from getting a start, and he must be dilligent in doing so. The writer has known many promising fields of beets made a loss to the owner through neglect of this weeding process early enough. It is well to remember that you cannot grow a profitable field of beets and a crop of weeds at the same time. This is a good reason why it is better to plant your beet seed in soil that has been cleaned of weeds the year before.

How often the weeding clutivator is to be used will depend upon the particular conditions of the field. Once a week is not too often for some fields, but may be unnecessary for others. Let the field conditions govern you, but be sure to keep the weeds from getting a start and smothering your beets. As soon as thinning and blocking is completed and you have killed the weeds between the rows, your field will be comparatively free of weeds. Then you will be able, through ordinary care, to keep the upper hand of the weeds and not till then.

When the young plant gets its fourth leaf the process of blocking and thinning begins. This blocking and thinning is now done by a crew of men using small, short-handled hoes, working along the rows, removing all but a single plant in a place, spacing about eight inches between plants and thoroughly cleaning the rows of all other beet plants and weeds. In California Japanese and Mexican laborers usually do this work. It involves crawling along the ground on the knees and is a task that the white laborer does not take to. In this thinning operation care must be taken to thin the beets down to a single plant by uprooting all other plants, however near to the plant left they may grow. Otherwise several plants may later appear where only one should be. Only one beet root can mature in a place. Thinners will generally cover from a half to three-quarters of an acre a day. Occasionally a worker is so quick and steady that he will do more, but not usually. The grower should keep a close watch on this operation to see that it is properly done. Some fields have been so badly thinned that they had to be gone over again.

With the thinning out of the way cultivation should be resumed and kept going until the beets are laid by at the end of the growing season. This cultivation should be light at first so as not to uproot the plants or cover them over. The spiketooth will be found best for all purposes after the weeders are laid aside. For ground that hardens, the teeth should be kept sharp with a slight up curve at the lower end. But the cultivator must be set so that dirt is not piled on the beet plants. Deep cultivating is not advisable in the early growth of the plants but should be deeper as the plants grow. While no fixed rule can be laid down for the number of cultivations that a field shall receive, because of soil and weather conditions varying so much, it is a good rule to follow, to cultivate once in ten days through the season. Cultivate after each rain, and in case of extended drouth the field should be cultivated frequently to conserve moisture. It should be remembered that cultivation serves the purpose of opening the soil to the chemical action of the air, aiding in the retention of moisture and ridding the soil of weeds that consume the beet plant food. Air is vitally necessary to plant growth, particularly to such plants as sugar beets where the root is the important part of the plant. Keeping the ground about the growing roots broken permits the air to penetrate and vitalize the soil about the roots. Then the rain penetrates this broken soil more readily. The dirt mulch made by cultivation tends to hold the moisture below.

The two-row, one-horse cultivator is the better cultivator to use in the beet field. This is a walking cultivator and for that reason it is apt to be discarded for the two-horse, four-row tool equipped for riding. The walking tool enables the driver to see what he is doing all the time. With the work of the cultivator before him the operator can avoid cutting gaps in the rows of beets, which is frequently done in the operation of the riding implement. The importance of preserving the "stand" as the thinners leave it, may be understood from a few figures:

Each yard square of soil is capable of bearing 9 beets. This gives 3 beets in 3 rows; the beets 9 inches apart; the rows 18 inches apart. There are 4840 square yards in an acre. Now, if the stand is perfect 9 x 4840=43,560 beets. If the beets weigh but a pound each, which is very low, the tonnage would be nearly 22 per acre. A beet should weigh better than two pounds. Applying this figure and the result is shown to be above 43 tons. Now notice the effect on the crop yield if by careless cultivating, four of these plants are destroyed; 5 x 4840=24,200 beets, or 12 tons per acre for one pound beets and 24 tons, two pound beets.

In connection with these figures it is fair to state that the writer gives these figures for the purpose of illustrating how important it is to get the stand as nearly full on the ground as possible. The writer never saw a perfect stand and does not know of anyone who has. Twenty-eight tons per acre is the best the writer has seen with his own eyes and he has been assured that 33 tons per acre have been produced. Either of these figures will serve as a goal for every sugar beet grower in California to strive after. There is no part of this country and perhaps no other country where the chances are better than in this state.

There is considerable difference of opinion regarding the depth of cultivating, the distance the ground should be broken from the roots and the sort of tools to be used. These are details that depend so much upon soil conditions, size of plants and the object sought in cultivating that no rule can be laid down for this work other than in a general sense. If the ground has a tendency to harden, disks should be followed by deer tongues or shovels. In using the disks they should be adjusted so as to throw the dirt from the beet plants instead of toward them.. Then adjust the deer tongues to follow so as to make a mulch and fill in behind the disks. This gives a good stirred-up condition to the middle of the row. As the beets grow larger the object must be to loosen the soil deeper. Sugar beets feed through countless minute, fibrous roots while in the early growing stage and care must be taken not to run the cultivator too near so as to injure them.

Keep the cultivator going just as long as it is possible to get between the rows, only stopping when the growth obstructs further work.

FARMERS' SEED GROWERS CO-OPERATIVE ASSOCIATION

The following account of the activities of seed farmers in Wisconsin is found in an April issue of the Deutsche Landwirtschaftliche Presse, published at Berlin:

The seed growers' association known under the name of the "Wisconsin Experiment Association" was founded on a cooperative basis in the year 1901 by 187 members. In order to make sure that the members recognized the full importance of the objects in view, it was decided that at first only the farmers who had attended a state school of agriculture would be admitted as members.

The expenses of the association were defrayed by the members only during the first two years. Since 1903 the state has granted a subsidy, which last year amounted to about $5000.

The activity of the association has been considerable from the very beginning. After the secretary of the associaton had decided upon the most suitable varieties of seed at the farm of the experiment association, every member received enough seed for two acres with which to carry out comparative trials. Altogether the experiments are conducted on a large scale; thus for five years 1020 members experimented with barley and 1500 with maize. Already, from the beginning, the members in the various counties were invited to form centers for the supply of selected seeds in their vicinity. In this way 1500 centers for maize were established by the side of those for barley, oats and rye, and their action was such that the neighboring farms soon adopted the new varieties and thus the desired uniformity in the varieties cultivated was attained, which contributed largely to the present reputation of the association for its maize and other cereals.

The association has also rendered valuable service in the control of plant diseases.

Owing to the considerable growth of the association, a certain decentralization has become necessary. It has been met by the foundation of local sections for the several counties, which bear the title of "County Orders of the Experiment Associaton." They are under the supervision of the central management and have a secretary who is appointed and paid by the state association. When in a county more than 50 farmers grow seeds according to the instructions of the association, such county orders are founded. At present there are 38 of them.

For the sale of the selected seed special packages bearing the trademark of the association are used. But previously, in the course of the year, the secretary of the county order must have inspected the methods of selection and other treatment of the seed, and the central association must have made a final examination of the seed. A special list is kept of the names of the producers of "inspected" seeds.

For the further promotion of the sale of seeds, the state association has already erected some seed granaries furnished with the necessary appliances.

ADVANTAGE OF THE AUTO

Touching upon the automobile and its advantages, or rather its necessity, to the farmer we have the following from Mr. A. P. Griffith, an extensive grower of citrus fruits with orchards near Azusa:

"The automobile is a necessity to a farmer when in the prosecution of his business of farming the time to be saved in the distance traveled warrants the idleness of his team and expenditure of the cost and upkeep of the automobile. On the contrary, when there is work for the team which would be interfered with by the trip which the farmer must needs take in the prosecution of his farming business, or when he has added other business or duties which would consume his time or the time of his teams to an extent that would interfere with economic adminstration of his farming business, then the auto becomes a different factor and an economic tool.

"When his income will afford a moderate expense for an auto, then such becomes a necessity in providing for the comfort and happiness of his family, not quite reaching the dignity of a "luxury." Beyond this point the question of economy becomes a question as to whether or not he can afford a luxury which causes him to leave his business on pleasure tours.

"I am not saying one word about the farmers' right to recreation and rest, but only as to the economy of the ownership of an auto. The automobile like the telephone and other items in "the cost of high living," has come to be a necessity, though not in the economy of the farmer whose team can furnish his transportation without interfering with his ranch work."

NEW KINDS OF SHORT COURSES

Missouri announces that it has organized a new style of farmers' institutes. It extends from its university an invitation for farmers to organize local institutes covering a period of one week. This organization or institute club must consist of 50 farmers, who each pay a tuition fee of one dollar. When the local organization is effected they notify the director of the short-course extension department what subjects or branches they desire instruction on, and the time of holding the institute or term of school is arranged for. From two to four lectures are given each day. Tickets of admission are issued to each person paying one dollar, the required membership fee, and no one but members is admitted.

It is claimed for this system of organization that a much greater benefit is derived by those participating than when the audience is made up of idle listeners who are not specially interested in the work. There has been no trouble so far in getting the required 50 members, and the work is one of intense interest to both pupil and teacher.—20th Century Farmer.

COMPASSION

Hobo—I've eaten nothing but snowballs for three days.

Lady—You poor man! What would you have done had it been summer time?

STEAMSHIPS THROUGH CANAL

The following is a list of the 46 vessels now commissioned in the coast trade:

American-Hawaiian Steamship Company—26 vessels—To San Diego, Los Angeles harbor, San Francisco, Portland, Seattle and Tacoma; sailing every five days; time in transit to San Francisco, 23 days.

Lukenbach Steamship Company—seven vessels—To Los Angeles harbor and San Francisco; cargo for North Pacific coast ports transshipped at San Francisco; sailing every 10 days; time in transit to San Francisco, 27 days.

Atlantic & Pacific Steamship Company, W. R. Grace & Co., agents—four vessels—To Los Angeles harbor, San Francisco, Portland and Puget Sound; sailing every 14 to 18 days; time in transit to San Francisco, 20 days.

Arrow Line, A. H. Bull Steamship Company, agents—three vessels—To Los Angeles harbor and San Francisco; sailing every 20 days; time in transit to San Francisco, 24 days.

Sudden & Christianson Steamship Company, D. B. Dearborn & Co., agents—six vessels—To San Pedro, San Francisco and Seattle; sailing every 20 days; time in transit to San Francisco, 23 to 25 days.

Tolls amounting to $735,182 were collected from vessels using the Panama canal in the three months ending November 1. Before the canal was open to merchant ships, $11,610 had been collected on barge traffic, making the gross income to November 1 total $746,792. In October 45 vessels passed through southbound and 40 northbound, paying $377,000.

$200 to $300 an Acre From a Walnut Grove

in full bearing is not unusual and many groves are producing even more. There's money in Walnuts.

MAYETTE! True Wiltz Strain! For productiveness, freedom from blight, and wonderful Quality, the Wiltz strain of Walnuts has no equal in any other of the standard varieties. Late Bloomer.

FRANQUETTE! True Vrooman Strain! Next to the Wiltz Mayette, the best Walnut for Northern and Central California. Late Bloomer.

Our Scions of Franquette and Wiltz Mayette, cut by R. Wiltz, a pioneer Walnut grower, are not only absolutely true to the strain, but are from selected trees. They are the best.

Kirkman Nurseries
RELIABLE TREES AND VINES

We again solicit the fruit tree and vine orders of the planters of the West, knowing that nothing but the **Best** will satisfy the experienced buyer. Twenty-eight years of successful nursery business has proven the quality of

KIRKMAN TREES

and the treatment Kirkman accords his customers. Our steadily growing patronage has demanded that we grow more stock each year, until we now have more than **five million** trees and vines growing in our nursery plants in California and Arizona. A considerable portion of the stock in our nurseries, which will be ready for delivery this coming winter and spring, is already sold to early customers, but we still have a complete stock of all varieties of fruit trees and vines, as well as a general assortment of **ORNAMENTAL** and **SHADE** trees, etc., etc. What are you going to plant? We have it, without doubt, in large or small quantities. Illustrated price catalog on application. Please mention what varieties you are expecting to use.

KIRKMAN NURSERIES **2525 Tulare Street, Fresno, Cal.**

COMMON SENSE
IN BUYING TREES

Many planters overlook the importance of buying good trees. The first cost of the tree is the smallest item. You spend years of time and lots of money before you know what your trees will produce.

So-called "cheap" trees are seldom cheap.

It is the extra fancy fruit that sells quickly and brings big profits. Thousands of growers will tell you that Roeding's trees grow true to name and are the most satisfactory kind to plant. We grow everything that grows, but specialize on fine citrus and olive stock.

Free Service

We have a special service to offer every purchaser of our trees, that costs you absolutely nothing. It means protection for you against costly mistakes—help in planting, pruning, spraying, irrigating, marketing, etc. Write today for further information.

Write or Call and See Us

Send us your list of what you expect to plant this season and we will be glad to quote our lowest prices and offer our suggestions.

Roeding & Wood Nursery Co.

NITROGEN IN LIQUID MANURE

THE liquid manure used at the experiment station of the Illinois University is made in the following manner. About 35 pounds of fresh cow manure is put in a 50-gallon barrel. This is filled with water and allowed to stand for a day with occasional stirring, and then the liquid, holding the soluble portion of the manure and carrying a part of the solids in suspension, is drawn off for use. This is called by us the "first extract." The barrel is again filled with water and the manure (mostly floating on the surface), is allowed to ferment for a week or fortnight. The "second extract" is drawn off and used, after which the residue is removed from the barrel and the process repeated. The plant food content of these two extracts, their relation to equivalent amounts of chemicals which might be substituted for the manure, and the relation between liquid manure prepared in this manner and that prepared by boiling or steaming manure, are subjects that require investigation. I wish in this article to discuss these subjects with respect to nitrogen, giving the results of some analyses and other experimental work and pointing out their significance.

Values of the Two Extracts.

The manure used for their preparation was cow manure dropped the night previous. It contained the average amount of moisture, about 75 per cent, and 8.9 pounds of nitrogen per ton of moist manure. This means, of course, 36 pounds of nitrogen per ton of dry matter in the manure. A portion of each extract was evaporated to dryness and weighed in order to determine the amount of solid matter removed by each. The following figures were obtained for the total amount of solid matter present in 40 gallons of extract (about what a 50-gallon barrel will hold outside of the manure): first extract, 1.61 pounds; second extract, .844 pounds. The first extract contained very nearly twice the amount of solid material contained in the second. The fertilizing value of liquid manure is to be measured by the amount of nitrogen (also phosphorus and potassium) it contains and an analysis of each extract showed the total amount of nitrogen in each to be as follows: first extract, 28 grs. or 1 oz.; second extract, 13.6 grs. or ½ oz. In other words, the first extract was twice as strong a fertilizer (so far as nitrogen goes) as the second. The value of the second extract, about one-half that of the first, will give an approximate idea of the importance of using fresh manure whenever possible and when this is not possible, of preventing leaching to as great an extent as possible. A. D. Hall, of the Rothamsted experiment station, England, gives the following relative values for nitrogen in the drainings from fresh and old manure, which support this advice:

Per cent of nitrogen in liquid manure—fresh, .044; old, .026.

Chemical Liquid Manures.

In order to obtain the same strength of nitrogen in a chemical liquid manure, the weight given below of any one of the chemical fertilizers named should be added to 50 gallons of water.

Name of Chemical	Strong Extract	Weak Extract
Ammonium nitrate	4 oz.	2 oz.
Ammonium sulphate	6 oz.	3 oz.
Nitrate of potash	9 oz.	4.5 oz.
Nitrate of soda	8 oz.	4 oz.

The very small amounts named here serve to show the dilution of liquid manure as ordinarily made. Stronger solutions of chemicals than these can be used with safety, the amount of sulphate of ammonia or nitrate of soda usually recommended being one pound to 50 gallons of water.

After Effects on Soil.

Of the chemical liquid manures named above, ammonia sulphate gives an acid reaction to the soil, and its use should be accompanied by applications of lime from time to time to prevent the soil becoming acid. Nitrate of potash and of soda, on the other hand, have a tendency to cause alkalinity in the soil. Ammonium carbonate, which is the main constituent of liquid manure made from dung, has the same effect. The use of any of these should be restricted as much as possible on heavy clay soils, since they cause the particles to run together and form a plastic mass, which becomes hard and impervious to water and air when it once dries. Limestone is said to relieve this condition also. The mention above of the fact that carbonate of ammonia is the main constituent of liquid manure leads me to discuss its origin and peculiarities of behavior and point out their meaning to the user of liquid manure. The majority of the soluble part of manure, the urine, is a compound composed of nitrogen, carbon and hydrogen. Urea itself is so easily transformed by bacteria into carbonate of ammonia that in the drainings of a manure pile, urea can rarely be detected. Now, carbonate of ammonia is composed of carbon dioxide, water and ammonia, and decomposes at ordinary temperatures, the more quickly the higher the temperature, into ammonia and carbon dioxide, which are both gases and are lost into the air, and water. This is the reason that a manure pile usually smells of ammonia. A familiar example of carbonate of ammonia is the ordinary smelling salts, which is carbonate of ammonia to which some perfume has been added. The pungency of the salts is due to ammonia, although its odor is covered by that of the perfume.

Now, carbonate of ammonia is neutral in reaction and if a test is made with litmus paper liquid manure will be found to be neither acidic nor alkaline. But when heated the carbonate of ammonia breaks up into ammonia and carbon dioxide, which are lost, and water. The explanation of this reaction shows why ammonia is lost when manure is boiled, and makes me question, as I have heard practical florists do, whether the ammonia lost by boiling or steaming manure is more than the additional nitrogen caused to go into solution by this method; and so does it pay to boil manure to secure liquid manure? The question raised here cannot be answered accurately because the amount lost depends on the length of time it is heated and on the composition of the manure used, which is variable. In the simple experiment described below, however, is shown a method for preventing its loss. Into each of three test tubes (one inch wide by six inches long, say,) put a little liquid

PLANT APRICOTS

Consider these facts—
Market—The entire world.
Demand—Steadily Increasing.
Supply—Grown commercially only in California.
Profit—From $175 to $300 an acre.

Weigh the evidence, and your own good judgment will tell you to plant

SILVA-BERGTHOLDT'S
Foot-Hill Grown
Apricot Trees

Prized for their thrift, hardiness, good root systems and freedom from disease.

Though we have an extra fine block of Blenheims, Royal, Newcastle Early, Moorpark, Routier's Peach, and Tilton on Apricot, Peach and Myrobolan Root, a shortage of good stock is expected this year, so order now and get choice trees.

manure (about one inch). To the first add a few pieces of carbonate of soda or potash, or some lye or any alkali. To the second add nothing and to the third add a few pieces of acid phosphate. Now, moisten three strips of red litmus paper in water and lay them across the top of the tubes, after these are placed, heat each of the tubes to boiling and boil for a minute or so. Then stand to one side and examine for five minutes. The following results will be obtained: The litmus paper on (1) will be a deep blue, (2) will be rather less blue, but noticeably so, while (3) will remain red.

The explanation is simple but very significent. During heating (2) lost its ammonia by the breaking up of the carbonate of ammonia as described above, and the ammonia, coming off into the air, caused the red litmus paper to turn from red to blue. The alkali in (1) assisted in this and other similar decomposition and hence the paper is deeper blue in this case. In (3) the acid phosphate has united with the ammonia in carbonate of ammonia forming phosphate of ammonia which will not break up on heating and so the ammonia is not lost. A large number of acid substances would have served as well but acid phosphate was chosen because of its practical importance. By the addition of acid phosphate to manure before boiling, no ammonia will be lost. The amount to add is of interest also. It can be calculated that for liquid manure of the strength described above, about 30 pounds of acid phosphate per ton of manure would be sufficient if all the nitrogen were present as carbonate of ammonia. Since it is not, this amount should be ample to prevent any loss.—F. W. Muncie in Gardening.

Small Fruits Vegetables

TELLS POTATO GROWERS HOW TO SAVE MILLIONS

MILLIONS of dollars of unnecessary losses are being suffered by the potato growers of California, the University of California now reports. Preventable diseases of the potato plant—this is declared by the university the cause of these immense and needless losses.

A striking example given by the university is that newly reclaimed land in the delta of the San Joaquin and Sacramento rivers will sometimes yield from 200 to 300 sacks of potatoes to the acre for the first year or two, while ten years later, after five alternate plantings of barley and potatoes, the yield often sinks to as little as 35 sacks to the acre. The spread of preventable diseases is the chief reason for this decline.

The university estimates that a million dollars a year is lost in the delta region from one single fungous disease, rhizoctonia, which lives on from year to year in the soil on the roots of various plants and then attacks the underground stolons of the potato plant and prevents the formation of tubers.

Other great losses are caused by two wilt diseases, due to the growth of two species of fungi in the stems, a growth which cuts off the supply of water from the roots. Moreover, these wilt diseases furnish means of entrance for jelly end, dry rot and other destructive fungous and bacterial diseases of potatoes.

"What must be done to prevent these costly diseases?" ask the potato growers. Here are some of the university's answers, as given in a circular, "Potato Growing in the San Joaquin and Sacramento Deltas of California," written by W. V. Shear, assistant horticulturist in the bureau of plant industry of the United States department of agriculture, and just published by the university.

The land which has become infected with potato diseases must be planted for several years with crops which are not subject to these particular diseases, in order that the fungi, worms and bacteria which are their cause may starve out of the soil. For this rotation it is best not to use alfalfa, peas, beans, clover or onions, but to plant certain other crops less likely to carry any of the potato diseases; for example, barley, oats, corn, buckwheat, broomcorn, ryegrass, hemp or celery.

Disease-free seed potatoes must be used. It is suggested that growers ought to cooperate in bringing such disease-free seed potatoes from some locality where the soil is not inoculated. If tenants will not do this, land owners should, stipulating in their leases that tenants shall plant only such seed as the owners furnish.

At harvest time potato growers should not leave the cull potatoes scattered over the field. No better way could be invented, says the university, for spreading fungi, worms and bacteria, which are playing havoc with the potato industry. The volunteer crop springing from the culls harbors disease.

European poptato growers, especially those of Great Britain and Germany, pay very strict attention to the quality and quantity of seed they use. This has led to the differentiation of the potato industry into seed and crop specialists. The seed specialist makes a business of producing high quality seed, while the crop specialist produces a high grade table potato. No such differentiation, at least to the same extent, occurs in this country. While it is true that in certain sections there is a well developed seed potato growing industry, but comparatively few growers in these sections are paying sufficient attention to the elimination of diseased and unproductive strains, or to keeping the variety grown free from mixture with other varieties.

Experiments made with insect-eating birds have proven that one bird will consume more than its own bulk of insects, daily. This fact alone should impress farmers with the great economic value of every insect-eating bird in relation to the well being of our crops.

Investigations show that within reasonable limits the larger the seed piece planted the larger is the resultant potato crop produced, says William Stuart, in Farmers' Bulletin 533. English and Scotch potato growers almost without exception plant whole tubers.

The middleman is nothing more than a farm hand but he is able to fix his own wages and to collect them and to multiply his transactions as he pleases.

Cherry Trees

Cherries are the first, the most attractive and the best fruit of the summer season. This, together with the fact that they are very profitable, yielding from $400 to $600 an acre, makes them a good "buy" for any fruit grower in position to raise them.

Our block includes Bing, Black Oregon, Black Tartarian, Burbank, Royal Ann, and other good varieties on Mahaleb and Mazzard Root. Write Us First.

Economics on the Farm

OUR FACTORIES RUNNING OVERTIME

We were told some time ago that the business depression in the United States was "psychological," which was perhaps true, but even this abstruse reason why so many of us were "short" of money, and orders, and other desirable things, is disappearing as by magic. How to fill orders more quickly, rather than how to get orders, is becoming the problem with many manufacturers, and the "hard times"—which, by the way, were local and not general—will soon be only a memory.

It was reasonable to suppose that the war would create a demand for American goods, especially for food supplies. But even the most optimistic of Americans could hardly have expected such a boom as has already set in. About a week ago it was announced that the shipments from New York alone on the day previous were valued at $6,105,076—a new record for the port.

These figures remained a record for just four days, for on one day this week the exports were valued at $6,183,812. At this rate the debit balance against us in Europe, which has been bothering the bankers and the treasury, will quickly disappear.

All parts of the country are profiting by this trade, and all sorts of manufactured goods as well as food supplies are being purchased in enormous quantities.

Within nine weeks $135,000,000 of goods have been shipped to Europe from Chicago. Shipments of wheat since July 1st have been 115,000,000 bushels, and the demand increases.

There is an enormous demand for horses from the allied armies. The west is being covered for mounts and draft animals by agents of the foreign governments. Over $3,000,000 has recently been spent for mules and horses, and were it not for the lack of sufficient freight room purchases would have been more extensive.

Dealers in Kansas City and St. Louis have taken a contract to deliver 10,000 mules at $185 a head, or a total of $1,850,000. In the past month Kansas City has sold 6500 horses for the English army at about $175 each, a total of $1,137,500, and the purchases are continuing. A contract for 20,000 horses for the French government has been awarded to St. Louis. On a basis of $175 a horse, this will mean an expenditure of $3,500,000. The allies are making purchases also at Chicago, Memphis, Fort Worth, Oklahoma City and Wichita. These horses are all sent to Canada, and are shipped to Europe from Montreal.

A shoe factory in New York state has shipped 100,000 pairs of shoes to Greece and is at work on another order of the same size. Great quantities of machinery are being shipped to Russia, one order including 800 lathes. Russia has also bought 1,200,000 woolen blankets. An agent of the British and French governments has bought 2950 motor trucks, the order being divided among four factories.

Scores of other similar items might be mentioned. Besides the goods sold direct to the belligerents, orders are coming from Italy and South America for machinery which has heretofore been bought in Germany. The South American orders are particularly welcome, as they represent the beginning of a trade which American manufacturers are planning to hold permanently.

There are many busy months ahead for the manufacturers of the United States, and more than one year of profitable markets for the American farmer. Let's all get busy.—American Fertilizer.

CAPITALIZING FARM LABOR

Written for the California Cultivator By Sacramento Valley Contributor

Farming is one business in which the labor of a man and his family can be made a part of the capital stock of the operation. For instance, a man buys a piece of irrigated land for $125 per acre—undeveloped. He checks the land for alfalfa, buys lumber and builds barns, houses and other buildings, and soon has a place that if rented would bring $20.00 per acre annually and, if operated by himself and handled wisely, will return a larger income. Allowing $3 from the $20, or $17 net, a valuation of nearly $300 per acre is established, figuring interest at better than five per cent.

Now a part of the difference between $125 and $300 is for lumber, seed and other things, and the element of time consumed in waiting for the alfalfa to start and grow is another, but a large part of it has been created by labor which, in this way, is made a part of the capital stock of the place.

Professor L. H. Bailey says that an acre of land is as big as the man who is working it. It may be an unimportant fraction of an unprofitable ranch or it may be furnishing the best part of the living for a family. Brains, muscle, energy and ability enter into the size and capacity of any farming proposition just as in all other business.

There are hundreds of acres of irrigated land in California that can be capitalized by intelligent labor to make them earn incomes on far greater sums than $300 per acre, but other lands similar in every way and adjacent, perhaps, may not be earning interest on a $40 per acre valuation in ten years from now. It all depends on the man on the job.

AND SHE KEPT ON SMOKING

"Aunt Chloe, do you think you are a Christian?" asked a preacher of an old negro woman who was smoking a pipe.

"Yes, brudder, I 'spects I is."

"Do you believe in the Bible?"

"Yes, brudder."

"Do you know there is a passage in the Scripture that declares that nothing unclean shall inherit the kingdom of heaven?"

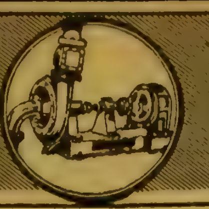
"Yes, I'se heard it."

"Well, you smoke, and there is nothing so unclean as the breath of a smoker. So what do you say to that?"

"Well, when I go dere I 'spects to leave my breff behind me."—"Kansas Farmer."

The economic distribution of farm products is today the world's greatest problem.

Irrigation Forestry



AN IDEA FOR SETTLERS ON IRRIGATION PROJECTS

Written for California Cultivator
By Sacramento Valley Contributor

IN every irrigation project there are always some pieces of land that are neither occupied nor cultivated until many of the surrounding tracts are partially or fully developed. They are unsightly, ragged looking patches on what would otherwise be an attractive landscape. The roadsides along such pieces grow up to weeds and there is a general air of desolation.

The suggestion we have to make is that the people who live adjacent to or near these tracts get in touch with the owners and make arrangements to put in some kind of crop, even if it is only barley or wheat for hay, and plant it well out into the road so that when it is cut in the summer the area will have a "cleaned-up" look until it is ready to sow again, then the growing grain looks well, and so on until some more intensive development is undertaken.

Everyone in the community will be benefited if such a proposition is taken up and generally carried out. First, the settler living near should get some profit for his work, and in the increased value of his property because of the better appearance of the neighborhood there should be a further benefit. Then the whole district, and consequently the reputation and value of all property from a homemakers standpoint, will be enhanced. Finally, the non-resident owner will be able to sell for more should it be impossible for him to develop his property as he may have planned.

The non-resident owner of the ragged unimproved land is certainly the last to be considered, for either as a deliberate speculator or an unfortunate victim of circumstances by which he is prevented from developing his property he is reaping the benefit from the development his neighbors are making on surrounding land. From the standpoint of the residents he is entitled to but little immediate return from his land and if anyone had in mind the purchase of such a piece of property they would not do anything to increase its selling price. But as a general thing this policy would result in more harm to the residents than to the owner of the undeveloped land.

The more quickly all of the land in a new section is improved the greater the benefit to all.

A MINER'S INCH

The following may be of interest to water users. The first taken from Colorado statutes, section 7026, series of 1891.

Water sold by the inch by an individual or corporation shall be measured as follows, to-wit: Every inch shall be considered equal to an inch-square orifice under a five-inch pressure and a five-inch pressure shall be from the top of the orifice of the box put into the banks of the ditch, to the surface of the water.

From California statutes, sectional, page 660, we take the following:

The standard miner's inch of water shall be equivalent or equal to one and one-half cubic feet of water per minute, measured through any aperture or orifice.

From section 4855, series of 1899, Montana statutes, we take the following:

Where water rights expressed in miner's inches have been granted, 100 miner's inches shall be considered equivalent to a flow of two and one-half cubic feet (18.7 gallons) per second; 200 miner's inches shall be considered equivalent to a flow of five cubic feet (37.4 gallons) per second, and this proportion shall be observed in determining the equivalent flow represented by any number of miner's inches.

The only other state we are able to obtain information from is Nebraska. We quote from section 6811, series of 1895, as amended by section 23, page 510, series of 1911:

What is known as the miner's inch shall be regarded as one-fiftieth of a cubic foot per second in all cases.—S. L. Macdonald, Colorado Agricultural College.

FARM BUREAUS IN CALIFORNIA

Alameda County, W. H. Nixon, Adviser

San Leandro, Wednesday, December 2; Castro Valley, Friday, December 4; Hayward, Monday, December 7; Pleasanton, Wednesday, December 9; Oakland Day, Friday, December 11; Murray Township, Monday December 14; Irvington, Tuesday, December 15; Centerville, Friday, December 18; Newark, Monday, December 21; Niles, Wednesday, December 23.

Napa County, H. J. Baade, Adviser

Browns Valley, December 2; Coombsville, December 3; Salvador, December 5; Napa, December 7; Fly District, December 9; Soscol, December 11; Carneros, December 14; St. Helena, December 16; Calistoga, December 18; Berryessa, December 23; Rutherford, December 25; Howell Mt., December 26; Wooden Valley, December 28; Pope Valley, December 30.

Soil fertility and the importance of cover crops to our soils will be discussed at these meetings.

Madera County, Thos. C. Mayhew, Adviser

Eastin, 10 and 11.
Coarse Gold, 14 and 15.
Oakhurst, 16 and 17.
Nipinnawassee, 18 and 19.
North Fork, 21 and 22.

San Joaquin County, Frank Lyons, Adviser

December 14, Lockeford, N. H. Locke, director; December 17, Ripon, E. A. Clough, director; December 18, Manteca, J. P. Watkins, director; December 21, Escalon, J. W. Graves, director.

Officers for the year 1915 are being elected at the center meetings. Five sections have already held their elections with the following results: Thornton, Ed. Barber, director, and Robert Nichols, president. Linden, Ed L. Davis, director Amos Swank, vice-director, and Evans Bluett, secretary. Escalon, E. A. Clough, director; C. Campbell, president; L. J. LeTourneau, vice-president, and F. L. Browne, secretary. Ripon, J. R. Watkins, director; A. R. Magruder, president; H. L. Dickey, secretary, Manteca, J. W. Graves, director; W. W. Cowell, president; Mrs. G. F. Dryden, secretary.

At the annual meeting of the San Joaquin County Farm Bureau, held on October 24, the following for the year 1915 were elected: President, Ed Powers, Manteca; vice-president, Asa Clark, Stockton; secretary-treasurer, J. P. Irish, Jr., Stockton; directors-at-large, J. E. Aggeler, Holt; Amon Swank, Linden; George Ashley, Lodi; Frank Boggs, Stockton.

The Use Of
Hercules Dynamite
On Farm, Orchard and Ranch

Prepare now for
Spring Tree Planting

YOU can materially increase the strength and yield, and hasten the growth, of trees to be planted in the spring by dynamiting the holes for them this winter.

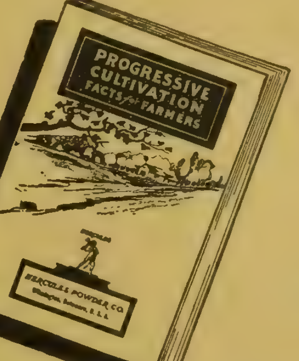
Let the holes lie open during the winter. Then plant the trees at the regular time next year.

You will be surprised at the rapid progress made by trees planted in this manner.

Hercules Dynamite breaks up the soil thoroughly for some distance around the hole. The young tender roots are thus enabled to spread and grow in a natural manner.

When two trees are planted at the same time and in the same orchard, one in a spaded hole, the other in a dynamited hole, the growth and development of the latter is invariably almost twice that of the former. This difference always shows when Hercules Dynamite is used.

If you are not thoroughly familiar with the advantages gained by using dynamite on the farm, write today for "Progressive Cultivation." It contains valuable information on tree planting, subsoiling, stump and rock blasting, drainage work and other agricultural activities.



PROGRESSIVE CULTIVATION FACTS for FARMERS

The Evolution of Irrigation

It is only a comparatively few years since practically all irrigating in California was done by means of open ditches. These gradually gave way to the use of wooden and concrete flumes. Today, however, all these methods have been almost universally superseded by the "K-T" SYSTEM of underground conduits—which provides for a perfect distribution of the water at the exact spot required, and at just the time it is needed. Fill out the attached Coupon for the "K. T." Brown Book on Irrigation, or write for any information you may require.

Send K. T. Brown Book to

KELLAR-THOMASON COMPANY

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

DOLLAR WHEAT

An enthusiastic Canadian wheat grower predicts that before the end of 1915 wheat will go to two dollars per bushel. He takes this position because of the destruction of vast quantities of wheat in Europe and existence of conditions which prevent production. In any case he feels there can be no mistake in making every American farm produce to its limit during the next year. After the Franco-Prussian war it is stated that wheat in Chicago was quoted at $1.63, this caused primarily as the result of the war in the two countries of France and Prussia.

FOOD TO THE BELGIANS

A bit of the suffering of the stricken Belgians may be lessened by the ship Camino which sailed last week from San Francisco and on Tuesday from Los Angeles harbor, carrying some 6,000 tons of food products, all a free-will offering from California. It is well that from our abundance we should send this shipload direct to the starving people. The vessel will go through the Panama Canal, thence direct to London for fuel supplies, thence to Rotterdam, from which point the food will be distributed by Dr. Henry Van Dyke, United States minister to Netherlands.

AGRICULTURAL BULLETINS

The United States department of agriculture issued during the past year, and distributed to the agricultural interests of the United States, over 38,000,000 copies of bulletins and circulars. This was 44 per cent more than any previous year. The publications included 55 new farmers' bulletins in addition to the many reprints of former issues. Something over 8,000,000 were distributed on orders of senators and representatives. A new educational feature put out by the department during the past year is the making of motion picture films of subjects of educational value. Fourteen thousand feet of films, covering some 19 subjects, were manufactured.

BUILD LARGE

The flurry caused by the declaration of war some months ago and the feeling on the part of some that great wealth was in store for this country because of war conditions in Europe have passed and America is settling down to meet the problem which has been brought her.

The immediate problem is the alleviation, so far as possible, of the terrible suffering, largely on the part of non-combatants. That problem is being bravely met by many different organizations, and the entire United States is combining in the work, but for the future it appears thare will be a great drain upon this country for staples, and we believe that every producer should plan large for the coming year's work. As to what prices may be secured no one can tell—presuambly they will be good—but the duty is before us and must be met.

PANAMA-CALIFORNIA

Only three weeks till the opening of the Panama-California Exposition at San Diego. There have been larger expositions, and the Panama-Pacific at San Francisco will exceed it very greatly in magnitude of buildings and number of exhibits, but in beauty of setting there has never been, and we believe never will be one that will outrank San Diego. The landscape architects have reason to be proud of the results achieved.

In every way it is typical of southwestern America. Every building, even to the concessions, carries out the same idea, and this effect is increased by the Spanish costumes of the attendants. We believe that every visitor will feel that he is in far away South America or in dreamland. As great as is the exposition at San Francisco, the one at San Diego will be well worth a visit by every Californian, in fact, every visitor to the state during the next 12 months. Plans are now in the making for a great event on the night of December 31 and the early morning hours of January 1.

EFFECTIVE WORK

The vigor with which the eastern Washington authorities took hold of the foot and mouth disease problem has apparently stamped out this disease from the section about Spokane. It appeared in a herd of pure-bred Holsteins which had been purchased in Wisconsin and shipped to Spokane. There were 101 of these pure-breds, aggregating in value about $25,000. They had been purchased by a progressive farmer who proposed to build up one of the greatest herds of Holsteins in the West. As soon as the cattle were unloaded at Spokane it was found that they were affected with this disease. They were immediately corralled, surrounded by patrols and every possible disinfection method observed. Later the animals were slaughtered, and every carcass burned, as were the corrals and all combustible material which had been used near them, even to the clothing of attendants. It is now felt that there is no possible danger of spread of the infection from this center. The compensation for the $25,000 worth of stock was about $4,000 paid by the department. The payment was based on meat values.

SUGAR FROM CANE

Notwithstanding the discouragement felt by many sugar beet growers because of tariff manipulations, there continues to be talk of still greater sugar production in the United States. It has usually been thought that our production would increase, if it did, along the line of beet sugar. But we note that a most successful experiment with sugar cane is being worked out in Arizona, and already many Californians are asking as to the possibilities of sugar cane. Especially in the Imperial is interest being awakened. It matters not which kind of sugar is produced, but it does matter that the United States should produce a greater proportion of the sugar it now consumes. In beet sugar production the United States stands fifth. European countries rank as follows: Germany 2,616,700 tons, Russia 1,723,700 tons, Austria 1,628,300 tons, France 781,020 tons, Italy 327,800 tons, Belgium 226,200 tons, Holland 225,300 tons, Spain 160,000 tons, Denmark 145,700 tons, Sweden 136,500 tons, Roumania 34,000 tons, Bulgaria 7,800 tons, Servia 6,500 tons, England 4,600 tons, Switzerland 4,050 tons. Total 8,118,190 tons.

The total production of the United States in beet sugar is 625,314 tons, and yet there is no country which offers such possibilities for sugar production as the United States.

COMPULSORY COOPERATION

That the few should be compelled to cooperate for the benefit of the many is not new along some lines of public welfare, but in the marketing of products of farmers, it surely will be a novel proposition. As novel as it may appear, it has been suggested by a fruit grower of Fresno County. At a meeting of fruit growers recently held in that great fruit growing center a special committee reported on a proposed law meant to insure the establishment of a great fruit exchange on the same basis as the drainage and reclamation districts. As stated by one of its friends, perhaps this might work out, and to the advantage of the fruit industry. We wish it could be made operative, for there is certainly a great injustice done to the fruit growers by those who throw their fruit into the market and cut prices. We will watch the working out of the suggestion of the Fresno grower with great interest.

"The scheme proposed is to have a law enacted under the provisions of which we can organize a cooperative exchange on the same principles as reclamation districts, drainage dikes, irrigation districts, etc. That is, when a majority of the growers, say 66 per cent, have signed up it obliges all growers to become a part of the exchange organization.

"By illustration, if the Associated should get 66 per cent of the growers to sign up under its contracts, then all of the growers of raisins would be forced into the cooperative marketing plan. Under the present plan of marketing peaches there is no incentive to produce an extra high quality, for the fruit is sold at the same price. This is a great disadvantage, and the organization fails to meet the needs of the growers."

Agricultural Notes

The native Cuban walnut has been found a very desirable stock on which to graft imported varieties of walnuts and pecans.

Size of orange boxes is prescribed by the government of South Africa. Much attention is being given to careful handling and packing of fruit.

Federal reserve banks have been opened in 12 cities of the United States. The bank for the Pacific coast states is located at San Francisco.

The Florida Growers' and Shippers' League has sent out a second appeal for funds with which to fight the citrus canker. Fifty thousand dollars is the sum they have set out to raise.

Farmers of Rhodesia, South Africa, have made trial of the tepary bean, but have so far found it not the heavy bearer reported in Arizona. It has proved very susceptible to attacks of the stem maggot.

Forty-six merchant vessels are now in the regular trade between New York and California ports, passing through the Panama canal. The time in transit from New York to San Francisco ranges from 20 to 27 days.

A single shipment of 3,000,000 eggs from western states was recently exported to England from Boston. The reduction in England's egg supply from Russia on account of the war is said to have brought about the shipment.

The success of onion growers of Antigua, British West Indies, in marketing their crop in Canada has suggested that other vegetables may profitably be placed there during the winter. Tomatoes and pumpkins have arrived in best of condition.

In parts of Maine, New Hampshire, Massachusetts and Connecticut, the department of agriculture has imposed a quarantine on the transportation of stone taken out of quarries, the reason being that stone has been found to carry eggs of the gipsy moth.

Under the quarantine imposed because of the foot and mouth disease, the requirements as to inspection and certificate apply not only to animals, but also to straw imported from foreign countries, used as packing for merchandise and also (at many places) wool.

A farm demonstration train made a five months' trip in the Philippine Islands during the past spring and summer. One to three day stops were made at all towns, the subjects covered being rice and sugar production, animal industry, locust extermination and vegetable and fruit culture.

By conservative estimate 300 fires or so-called explosions occurred in wheat threshers in eastern Washington this past season. Investigation has not shown that these were caused by incendiarism as at first supposed, owing to their unusually frequent occurrence. Effort is being made to determine a practical way of controlling these smut explosions by live steam or other means.

A process has been perfected for solidifying molasses into blocks. This overcomes the difficulties previously attendant on the shipment of molasses, involving as it did the employment of expensive packages and the handling of a product which owing to its liability to frothing frequently gave rise to trouble and loss. It is stated that in its best form the product is black or dark green in color; never red or reddish bown; it should be brittle and in appearance vitreous.

Agricultural News Notes of the Pacific Coast

Northern California

A rice mill is to be built at Willows, Glenn County.

A rice paper mill is in prospect for Colusa County.

A 150,000-tree nursery will be started at Orland, Glenn County.

Sutter County is to strengthen and heighten many of the levees along the river.

Ukiah, Mendocino County, shipped over ten tons of Thanksgiving turkeys.

One train of 34 cars of cattle was recently shipped from Dorris, Siskiyou County.

Honey Lake Valley Acres will be watered by an irrigation project now contemplated.

Big shipments of celery are now going out from the delta region of the San Joaquin.

Large quantities of farming land near Hamilton, Glenn County, have recently been sold.

A farmers' institute was held at Grass Valley, Nevada County, on Tuesday and Wednesday.

Modoc County has shipped 15,000 head of beef cattle to the San Francisco market this season.

The Yolo County farm bureau is urging dairymen not to breed heifers earlier than 15 months old.

One company raising rice in the Sacramento Valley has marketed $225,000 worth this season.

Orange growers of Lincoln, Placer County, have formed an exchange and are now ready for sending out citrus shipments.

Fifty thousand acres of rich marsh land in Siskiyou and Modoc Counties are to be opened for settlement on December 30.

Commissioner Harney of Yuba County reports common barnyard millet as seriously infesting some of the rice fields.

Experiments with cotton in Sutter County have proven satisfactory this past season. Durango long staple was the variety grown.

Five thousand acres near Grass Valley are to be given irrigation water, providing a vote on $75,000 bond proposition carries.

Turkey raisers of Lodi, San Joaquin County, are selling turkeys at 20 cents per pound, live weight, which is lower than they had hoped to sell for.

Farm Adviser Hecke, of Yolo County is joining Adviser Baade of Napa County in furthering better agricultural methods in both counties.

Even the far northern section of Shasta County is planting oranges. The first fruit ever shipped from that county was recently harvested at Olinda.

The Cattlemen's Protective Association composed of breeders interested in beef cattle was recently formed in San Francisco. Ed. de L. Cebrian, was appointed secretary.

The waters of the Feather River are to be made navigable to a higher point than heretofore and this, it is thought, will be of great benefit to Yuba and Sutter Counties.

Central California

Exeter's new creamery was formally opened last Monday.

Kern County farmers are investigating as to the advisability of raising rice.

A farm bureau center has been organized at Newman, Stanislaus County.

The Modesto Farmers' Union held an all-day reorganization meeting at Modesto December 1.

Plans are being made for the reclamation of lands of the Tulare Lake section of Kings County.

The Kern County farm bureau held a meeting of special interest to hog breeders on December 3.

A raisin thief at Fresno was recently convicted and sentenced to serve three years in San Quentin.

Tulare County has already shipped part of its exhibits for the Panama-California Exposition at San Diego.

The summer session of the State Fruit Growers is scheduled for Stanford University, probably the last week in July.

The Stanislaus County board of trade is distributing over 80,000 postcards, illustrating the dairy industry of the county.

The Stanislaus County Poultry Show, which opened at Modesto, December 2, was a success in exhibits and in attendance. The birds were judged by the score card system.

It has been proposed to locate a cooperative cannery at Kingsburg. Others interested are talking of securing one or more privately owned canneries. Anyway Kingsburg wants a cannery.

The crop estimates put forth by the United States Department of Agriculture November 1 announces that the raisin grape yield in California is 7,300 pounds per acre, against 4,000 pounds last year, and the production is fixed at 91 per cent of a full crop. The quality of the raisin grapes is set at 96 per cent perfect.

The Madera Cooperative Creamery paid to dairymen for butterfat during November $4,660. A total of 15,000 pounds of butter was made, which is an increase of 200 pounds per day over the previous month. The dairy industry is growing rapidly in Madera.

Attention of the state health board has been called to the fact that the Porterville fruit brokers have been buying in this district and surreptitiously shipping to bay district markets small consignments of fruit for which the Tulare County authorities have refused inspection certificates, setting forth the fact that the oranges are up to the standard of maturity approved by the pure food division of the bureau of chemistry.

It is estimated that Tulare County's yield of Navels, Valencias and lemons will be 5,500 carloads, as compared with 5,800 carloads for last season. The reason for this falling off is in the light Valencia crop, which indicates now about a half crop. Last season the Valencia harvest amounted to 1,500 carloads, but next summer's shipments will probably not be over half that amount. The lemon crop is somewhat larger than last season.

Southern California

Riverside orange packing houses are planning for the heaviest run ever.

The Imperial Valley is becoming interested in the growing of sugar cane.

Orchardists of the Rio Linda section are purchasing nursery trees cooperatively.

"Plant Poppy Seeds Everywhere" is the slogan of many sections of California.

Brawley, Imperial County, is receiving large shipments of live stock for finishing.

A San Diego olive producer claims to have contracted for his crop at the rate of $225 per ton.

San Bernardino is planning great events for National Orange Show week, February 17-24.

The shortage of fall rains has been one cause of many forest fires, which have done much damage in mountain ranges.

Citrus growers have watched thermometers with anxious eyes during the past week. As yet no damage has been done.

Arroyo Grande and Santa Maria Valleys have supplied the beans for the first cargo of beans through the Panama Canal.

The authorities of Imperial County are discussing the matter of livestock quarantine to prevent introduction of livestock diseases.

The lima bean show held at the court house at Ventura brought out many contestants and a great showing of fine limas was made.

A representative of the University of California has been organizing the high school boys of the San Fernando Valley into an agricultural club.

The first coating of white on the Sierra Madre mountains was the result of the recent storm. The storm was very light and did but little good.

Hemet has organized a farmers' club. Dr. J. R. Wilson is president and Louis M. Jackson, secretary. The subject of the next meeting will be walnuts.

The Inland Waterways Association is aiding the settlers of the Imperial Valley in their campaign for an appropriation from congress for the control of the Colorado.

C. C. Brashear, secretary of the chamber of commerce of El Cajon, San Diego County, writes that the chamber is endeavoring to secure a cannery for that section.

The seven associations handling citrus fruits of Orange County through the California Fruit Growers' Exchange report about 75 per cent of the oranges in that county controlled by those organizations.

San Fernando is shipping more lemons than any preceding year. Out of her abundance she will, on next Saturday, send truckloads of lemons to Los Angeles, which will be sold for the benefit of Belgian sufferers.

The Placentia Orange Growers' Association, in annual meeting recently, elected the following directors: A. Pierotti, president; L. P. Drake, vice-president; William Berkinstock, treasurer. Abe Pritchard was elected secretary and manager.

The Coast

Oregon apples are going to Siberia.

The poultry show closed last week at Mount Vernon, Washington.

One thousand bales of cotton have been ginned at Chandler, Arizona.

Canyon City, Oregon, is sowing more grain than any preceding year.

The short course of the Oregon Agricultural College will begin January 4.

Several small ranchers near Chandler, Arizona, are engaging in ostrich farming.

Montana stockmen report livestock in better condition at this time than for several years.

Farmers' Week will be observed at the Oregon Agricultural College, Corvallis, February 1-6.

Farmers of Idaho met in Twin Falls last week and held a convention and exhibit of pure seeds.

New barns are being erected on the grounds of the Northwest Live Stock Association, at Moscow, Idaho.

The Maricopa County Poultry Association is holding its annual convention this week at Phoenix, Arizona.

Apple growers of the Northwest complain that the war has affected the dried apple market unfavorably.

Because of government regulations regarding disinfection several cars of sheep were held up at Flagstaff.

Nineteen cars of range cattle were recently shipped from Prescott, Arizona, to Tempe for winter feeding.

The union stock yards at Portland, Oregon, report the cattle market steady, with good stock being offered.

Range cattlemen of the Gila national forest of Arizona met at Silver City and perfected a strong organization.

Irrigationists of Oregon are urging an appropriation of nearly half a million dollars for reclamation work in that state.

Business men of Wenatchee, Washington, are urging for cold storage and by-product plants which will handle fruit wastes.

Hop growers at Salem, Oregon, are discussing the matter of formation of a large corporation to finance marketing operations.

Homestead settlers may enter lands under the Klamath project in Oregon and the extreme northern portion of California on December 30.

The Pure Bred Live Stock Association of Arizona held a banquet during state fair week. It is one of the strongest organizations in the state.

The Third Annual Farmers' Short Course will be held at the University of Arizona, Tucson, January 4-16. Several addresses will be made by Dr. H. J. Webber of California.

Oregon hop growers organized an association at Salem the first of the month, 125 growers becoming members at the initial meeting. Delegates from similar associations organized in Oregon, Washington and California will meet in Salem the latter part of the month and organize the Pacific Coast Association.

If It's
STILETTO
It's All O. K.

You don't need to ask a question—your dealer need not even talk—the name STILETTO upon a farm implement of any kind—a razor for yourself, or a kitchen knife for your wife—or any piece of cutlery or hardware—is all the assurance needed that it is absolutely right. A great deal of time, money and skill have been expended so as to make every article stamped STILETTO the very best of its kind.

Write us and we will give you the name of dealer in your locality.

BARLEY AND WHEAT, WHOLE OR GROUND, DRY OR WET, FOR PIGS

Written for the California Cultivator
By Leroy Anderson

IN order to find definite experiments upon this question it is necessary to go to the records at eastern experiment stations.

Barley

The following figures are from Bulletin No. 40 of the Colorado station on feeding whole and ground barley:

	No. of Tests.	Average Weight at Beginning.	Ave. Daily Gain.	Feed for 100 lbs. Gain, lbs.
Whole bald barley......	8	88	.58	500
Ground bald barley....	5	67	.74	360
Whole common barley	4	68	.49	540
Ground com'n barley..	4	47	.70	430

This experiment shows great gains in feeding ground over whole barley. With common barley the gain is about 20 per cent and with bald barley 28 per cent. The figures, however, are not comparable with those quoted in other experiments because skimmed milk was fed with the barley in the Colorado tests. It is presumed that the barley was really ground and not rolled, as is the custom in California.

The Ontario (Canada) agricultural college in its annual report for 1891 gives the results of experiments in feeding whole and ground grain to pigs. Barley was not fed alone but with peas, equal parts of each fed dry.

Feeding barley and peas, equal parts to pigs.

	No. of Pigs.	Ave. Weight Beginning, lbs.	No. of Days Fed.	Ave. Daily Gain, lbs.	Feed per 100 lbs. Gain, lbs.
Feed ground......	3	107	91	1.43	407
Feed whole........	3	109	91	1.22	477

This experiment shows a gain of over 14 per cent in grinding rather than feeding whole barley and peas.

Wheat

The Utah experiment station in Bulletin No. 70 reports an experiment on the comparative value of chopped or whole wheat for pigs, both fed dry:

	No. of pigs.	Ave. Weight Beginning, lbs.	No. of Days Fed.	Ave. Daily Gain, lbs.	Feed per 100 lbs. Gain, lbs.
Chopped wheat	2	126	135	1.22	431
Whole wheat..	2	148	135	1.23	444

This experiment shows a slight gain, about three per cent for the chopped wheat over whole wheat. It is doubtful if this is sufficient to pay for the cost of chopping.

The Nebraska experiment station reports in Bulletin No. 75 a test with whole wheat dry, whole wheat soaked 18 to 24 hours and ground wheat mixed into a thick slop. The soaked and ground wheat were both weighed before being wet. I insert the item of soaked wheat here to save repetition of the experiment below.

Wheat, whole, soaked or ground, for pigs.

	No. of Pigs.	Ave. Weight Beginning, lbs.	Ave. Daily Gain, lbs.	No. of Days Fed.	Feed for 100 lbs. Gain, lbs.
Whole wheat, dry	6	110	.63	91	637
Whole wheat, soaked	6	110	.70	91	575
Ground wheat....	6	108	.76	91	559

The author's comment upon this test is that "ground wheat gave the greatest return for the least amount of grain, but did not return so large a profit as whole soaked wheat, owing to the expense of grinding (eight cents per 100 pounds). The undesirability of feeding whole wheat dry seems to be indicated by these results."

Corn

There are few reports upon experiments in grinding barley and wheat for pigs, because most of the experimentation has been conducted in eastern states where corn is the chief feed for fattening pigs. On this subject the researches of Dean Henry of Wisconsin have been the most exhaustive that have been undertaken. His summary of seven years' winter feeding, as published in the 19th annual report of the Wisconsin station, will be interesting as a side light on the merits of ground and unground grain.

Ground and whole corn.

Year.	No. of Pigs in Each Lot.	Ave. Weight Beginning, lbs.	Condition at Beginning.	Saved by Grinding.
1896......	9	350	Thin	8 Pct.
	10	224	Fat	17.6 Pct.
1897......	9	211	Rather fat	11 Pct.
	7	190	Rather fat	*9 Pct.
1898......	8	185	Rather fat	5.4 Pct.
	8	184	Rather fat	8.4 Pct.
1899......	19	186	Rather fat	*2 Pct.
1900......	14	175	Rather fat	15 Pct.
1901......	12	146	Rather fat	6 Pct.
1902......	6	71	Fair	*1 Pct.
	6	80	Fair	3 Pct.
	6	133	Rather fat	8 Pct.

*Lost by grinding.

Dean Henry states that "the average saving by grinding was six per cent, an amount too small to pay for grinding in most cases.

Barley and Wheat, Dry or Soaked

1. At the Missouri station (reported in Bulletin No. 29), two lots of pigs were fed wheat chops and two other lots a mixture of four parts whole wheat and one of bran. The wet grain was fed after being soaked 36 hours.

2. Bulletin No. 70 of the Utah station reports two tests in which wheat formed a part of the ration. In the first two lots were fed a ration of equal parts of wheat and bran. In

the second three lots of pigs received a ration of equal parts by weight of bran and chopped wheat. One lot received dry meal, one meal that had been soaked 12 hours and one meal wet just before feeding.

3. The Canada central experimental farm in the annual report for 1900 reports feeding four lots of pigs on a mixture of equal parts of peas, barley and wheat. Lot I received whole grain soaked 30 hours. Lot II received whole grain dry. Lot III received ground grain soaked 30 hours and Lot IV ground grain dry.

Tables of results from the three experiment stations are as follows:

	No. of Pigs.	Ave. Weight Beginning, lbs.	No. of Days Fed.	Ave. Daily Gain, lbs.	Feed per 100 lbs. Gain, lbs.
1. Missouri—Wheat chop:					
Dry	3	111	99	1.89	416
Wet	3	112	99	2.04	400
Whole wheat 4-5, bran 1-5:					
Dry	3	118	99	1.39	508
Wet	3	119	99	1.26	550
2. Utah—Wheat and bran:					
Dry	2	83	112	1.32	436
Wet	2	69	125	1.25	470
Bran and chopped wheat:					
Dry	3	91	110	.65	643
Wet	3	93	110	.82	525
Soaked	3	86	110	.71	581
3. Ottawa, Canada—Peas, wheat and barley whole.					
Dry	4	67	119	.90	408
Wet	4	66	119	.88	388
Peas, wheat and barley ground:					
Dry	4	69	119	1.06	356
Wet	4	66	119	1.04	376

Bureau of Animal industry Bulletin No. 47 on the hog industry summarizes the above and experiments from five other stations in feeding many kinds of grain as follows:

Dry grain or meal required for 100 lbs. of grain	44 lbs.
Wet or soaked grain as meal for 100 lbs. of grain	434 lbs.
Amount of grain saved by soaking	10 lbs.

In all of the above tables the point to be especially noted is the amount of feed required to make 100 pounds of gain. In this summary the 10 pounds of feed saved in making 100 pounds of gain by wetting or soaking is but two per cent. This would seem hardly sufficient to pay for the labor and expense of soaking. Dean Henry concludes that "It is safe to hold that, if not unusually dry and hard, such large grains as corn and peas are at best but slightly improved by soaking, while all small, hard grains, such as wheat, are materially improved thereby. Any grain so hard as to injure the mouths of animals during mastication should always be ground or soaked.

Conclusions

Judging from the experiments quoted above, it would seem that so far as barley is concerned, one is safe in following the California custom of preparing the grain by rolling and that it is more economical to feed rolled barley dry than wet. To save labor a good way is to build a hopper into which may be placed a quantity of rolled barley and to which the pigs have continual access. Also have clean water always before them for drinking. For their health they should also have constantly in reach a mixture of such things as wood ashes, charcoal and salt.

At prevailing prices it is not evident that much wheat can be fed to fattening hogs in place of barley. San Francisco quotations on California Club wheat are $1.90 to $2.00 per 100 pounds. This is the cheapest. On barley $1.20 to $1.25 per 100. Add ten cents for rolling and barley is $1.35 per 100, or in ton lots rolled barley is quoted at about $26.00. For fattening hogs, wheat is "not in it" at the price with barley unless it is damaged wheat or for some reason cannot command the market price. If the wheat is good I see only one reason for feeding it, viz., to give a variety to the ration. In that case one-fourth wheat to three-fourths barley would suffice. In this instance it might be mixed with the rolled barley without grinding, as that amount would be well masticated with the barley. Or if rolled with the barley, the process would serve as a good preparation—and feed dry.

FOOT AND MOUTH DISEASE DANGERS

We sincerely hope that the quarantine in the middle west where foot and mouth disease is causing so much loss and inconvenience will be sufficiently rigid that we may have no outbreak in California.

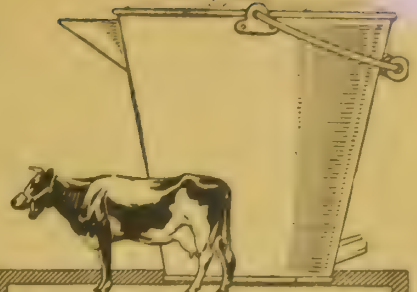
Some very interesting things have developed in connection with this epidemic, and some of them will be of value to California farmers whether we have the disease here or not.

All germ diseases are dangerous because there are so many ways that infection may be carried, and this seems to be particularly true of diseases of farm animals. During this outbreak in the east these dangers have been taken into consideration and warnings have been widespread and emphatic that all kinds of disease carriers be kept away from infected animals.

Perhaps the greatest agency in transmitting the disease from infected to clean animals is the curious human being, the man who wants to see but who does not realize that his hands and clothing, and particularly his shoes, may be the means of carrying germs to as many herds or places as he may later visit. The excretion from the sores in the mouth and on the feet of affected animals will be deposited on hay and grain and mangers and other parts of buildings, soil and manure in yards and fields may be infected, and no one should visit a herd unless a most rigid disinfection and fumigation follows. Officials and veterinarians who visit the diseased herds in the east wear rubber boots, coats, gloves and hats that may be washed with strong disinfectant and are fumigated with a gaseous disinfectant to kill any germs on their clothing or bodies. It is related that one man in an eastern state who was curious to see what the disease looked like went to an infected herd and examined the diseased animals, opening their mouths with his bare hands to see the ulcers. Then, without even so much as washing his hands, he went home and examined his own cattle in the same way. He infected every one of his own cows that he touched, and soon his whole herd had the disease. An unconquerable curiosity coupled with ignorance of the ease with which contagion is spread is quite as disastrous in hog cholera epidemics.

War is also being waged on pigeons, crows and all kinds of birds that come around barnyards. Thousands are being shot, and dogs that come around infected farms are meeting a like fate.

Barnyard birds and worthless cur dogs are of no benefit to a farm or a community. We have so many kinds of animal diseases now that can be spread by these sources that it will pay to be on the lookout for them at all times and by killing off the few that may be around put a stop to their increase.



The Size of Her Yearly Milk Pail

Many cows are really capable of a greatly increased milk yield but do not do their best through a chronic sluggishness of the digestive organs. Such cows need a medicine—just as human beings occasionally need medicines.

Kow-Kure is a scientific cow medicine, which has a direct and lasting tonic effect on the organs of digestion. For over twenty years it has been the standard medicine for the prevention and treatment of such common cow ailments as Abortion, Retained Afterbirth, Barrenness, Milk Fever, Scouring, and Lost Appetite.

You cannot afford to let a cow get down in health. Better keep Kow-Kure constantly on hand. Sold by feed dealers and druggists, in 50c and $1.00 packages.

Our valuable treatise on cow diseases—"The Cow Doctor" is yours for the asking.

GROW SUDAN GRASS

The Most Wonderful Grass of the Age

INTRODUCED AND ENDORSED BY THE U. S. AGRICULTURAL DEPT. AS NO OTHER GRASS HAS EVER BEEN BEFORE. PRODUCES MORE GRAIN AND BETTER HAY THAN ANY OTHER FORAGE PLANT KNOWN. UNDER ORDINARY CONDITIONS YIELDS 300 to 600 LBS. OF SEED AND 3 TO 6 TONS OF CHOICE HAY TO THE ACRE THE SAME YEAR. GROWS WHEREVER SORGHUM DOES. ALL LIVE STOCK PREFER IT TO ALFALFA. QUALITY OF HAY EQUALS TIMOTHY. SOW IT ANNUALLY WHERE DESIRED IN ROWS OR BROADCAST. ADAPTED TO ALL SORTS OF SOIL. RESISTS DROUGHT. STANDS RAIN. IT TAKES 2 TO 6 LBS. OF SEED TO THE ACRE IN DRILLS AND 10 TO 30 LBS. BROADCAST. LAST SPRING THE SEED SOLD FOR $2 TO $4 PER LB. IT IS NOW SELLING FOR $1 PER LB., AND IS SURE TO GO HIGHER BEFORE SPRING AS THE SUPPLY OF SEED IS LIMITED. WE WILL SEND PREPAID BY PARCEL POST 1 LB. OF GENUINE SUDAN SEED FREE FROM ALL OTHER SEED FOR $1—IN LOTS OF 50 LBS. OR UNDER, NOT LESS THAN 1 LB. CONSIDERED. LARGER LOTS SHIPPED BY FREIGHT CHEAPER PRICE. BETTER ORDER NOW AND BE SURE OF GETTING YOUR SEED AND SAVE MONEY BESIDES. ALL WHO SOW SUDAN GRASS SEED ANOTHER YEAR WILL MAKE BIG MONEY. INSTRUCTIONS HOW TO PLANT WITH ORDER.

You should install a Krogh Pump!

With a Krogh Pump you are assured the maximum water flow — and the cost will be the lowest, because of the unusual efficiency and reliability.

And you will also be pleased with our service. We are interested in your Pump as long as you own it. "Krogh" Service is good as long as Krogh Pumps are in existence.

Pumps for all wells, shallow, medium and deep. Write for our illustrated literature. Krogh Pumps have been manufactured in California for 35 years.

Our Field Engineers will be glad to advise you in making your selections.

Write for literature
GUERNSEY CATTLE CLUB
Box C. C., Peterboro, N. H.

Purebred Registered
HOLSTEIN CATTLE

With thirty common cows, each giving 3,000 pounds of milk per year, introduce a purebred registered Holstein bull. In two years, you'll be milking grade Holsteins yielding 4,000 to 5,000 pounds. In five years, you'll have 6,000 pound cows and will need to keep only fifteen cows to get the same amount of milk. In ten years, you'll have 8,000 to 9,000 pound cows and a ten-cow herd will produce as much milk as your thirty cows do now.

Quite a saving in labor, feed, and equipment to say nothing of the increased value of your cows and calves.

THE SUMMER SILO

Pastures do not generally furnish enough food for dairy cows during the hot dry summer months. It is well known that when the milk flow is once diminished by unfavorable conditions it is impossible to bring the cows back to a normal yield when conditions again become favorable. In view of this fact it is generally recognized by dairymen, and especially those on high-priced land, that the pasture must be supplemented by the use of the summer silo or by a system of soiling. By soiling is generally meant the growing of certain green crops that can be harvested as they are needed.

The use of silage or the soiling system results in an increase in the number of cows that can be kept on a given acreage. Both systems have the advantage of saving land, fencing and increasing yield of food and manure, besides resulting in a greatly increased production of both milk and butterfat. Which system is the most economical will depend upon local conditions and the price of labor.

With a view to securing some reliable data as to the comparative cost of using the summer silo or the soiling system, the Wisconsin agricultural experiment station conducted experiments with their dairy herd of 24 cows for three seasons, 1910, 1911 and 1912, and the Nebraska experiment station for one season, 1913, both reaching the same conclusion, that the summer silo was by far the most economical and that it was a necessity on the dairy farm.

It was found that as a means of keeping up the maximum milk flow during the hot dry summer months the soiling system was very nearly as efficient as silage, but the relative expense of producing and feeding soiling crops was considerably greater than that of silage. The daily harvesting of soiling crops in all kinds of weather and in the limited quantities required was the most inconvenient and expensive system of harvesting that could be employed. The expense incurred in the Wisconsin experiment in this connection was from $12 to $15 per month, for which no adequate increased returns in the milk production were obtained over that secured in the use of silage.

It is evident that it requires less labor to plow, fit and plant an entire field of corn for silage than it does to plow, fit and plant at different times a number of small plats to furnish a variety of soiling crops during the summer. The harvesting of corn for silage is done at much less expense for the reason that a well organized force of men and machinery to fill a silo in a single operation saves not only time but enables the work to be accomplished more efficiently.

CHOPPED FEED FOR HOGS

Written for California Cultivator
By G. A. Webb

After searching the market for several months we secured a cutter which can be run successfully with a five horsepower engine. With this machine we cut our alfalfa hay so fine it resembles meal. Five hundred pounds per hour is the capacity where pure alfalfa is cut. Corn is harder to cut, and with our power we can run through from 350 to 400 pounds per hour of either corn or barley.

How to Prepare for Cutting

Alfalfa, corn or barley must be well cured before cutting. We stack our alfalfa when cured and cut and sack in the fall. We raise barley for hogs, and to avoid expense of threshing we mow when ripe, and cure and stack for fall chopping. The corn is cut with self binder and put up in large shocks, and when well cured is ready for chopping. We prefer to mix the feed while chopping. We drive the loaded wagon up to the cutter, having corn lying crosswise in center of wagon with butts next to cutter for convenience, barley in one end and alfalfa in the other Feeding in this way the corn, barley and alfalfa are ready mixed as it enters the sack after passing through the cutter. We use ordinary grain sacks and these when tied weigh about 35 pounds each.

How to Feed

For horses and cows dampen before feeding. If they do not eat it well at first, mix a little rolled barley or bran with it. They soon learn to like it and it cuts down the feed bill.

For little pigs before and during weaning time where milk is not available, mix chopped feed with ground wheat, middlings or bran, equal parts. As the pigs get older decrease the amount of mill feed.

Always watch very closely to see that the little pigs do not become constipated or great damage will result in a very short time. Watch the little fellows especially and give more bran if need be to keep them in good condition.

We use barrels in which to mix the feed, a barrel for the little fellows with about two buckets of water to one of dry feed. Let soak from 12 to 24 hours, always feeding before it becomes sour.

Sows do well on chopped feed, and it should be mixed in another barrel and soaked. If they are very thin and have large litters it will be well to add a small amount of middlings until they become used to the chopped feed.

THE WORLD'S MILK RECORD

Written for the California Cultivator
By Sacramento Valley Contributor.

Another world's dairy record has been made in California, the Holstein-Friesian cow, Tilly Alcartra, by Alcartra Polkadot Corrector, a son of the great cow, Alcartra Polkadot, having just completed a yearly official test that shows a production of 30,452.6 pounds of milk containing 951.308 pounds of butter fat. This is the largest amount of milk ever produced by one cow in one year. The butter fat record has been exceeded.

Tilly Alcartra is owned by A. W. Morris and sons of Woodland, California. She was bred in Iowa, bought as a heifer and brought to California, was developed and dropped her first calf here. She is five years old. Until now the world's milk record has been held by a Massachusetts cow, Creamelle Vale, with a record of 29,591.2 pounds made in 1912. Previous to that another Morris cow, Aralia De Kol, held the record.

There are but six cows in the world that have produced over 28,000 pounds of milk in one year, and three of these are now in the same herd—Tilly Alcartra, Aralia De Kol and Riverside Sadie De Kol Burke.

There are at least three important factors that enter into the making of a world's dairy record, and it is difficult to tell which is the greatest. These are the cow, the man behind the cow, and the conditions under which the cow and the man are working.

The cow must be a great individual, must have the temperament and the capacity to transform an enormous quantity of feed into milk, and this comes by inheritance from a long line of ancestors with like temperament and capacity.

The man or men who mate and have mated the ancestors of a record cow, who care for and develop her during her early life and her later life, must be great individuals—men who have high ideals of an animal of maximum usefulness and who strive ceaselessly, untiringly and everlastingly toward the ideal. They must be great breeders, they must be great caretakers, for no matter how great the animal, she must have everything in the way of food that she can consume to advantage and every possible condition for her ease and comfort.

And the conditions must either be favorable naturally or be made so artificially. Many dairy establishments in the eastern states, where big records are made in spite of rigorous climatic conditions, are fitted up without regard to expense, so that light and heat and fresh air are under as nearly perfect control as possible. A cow making a big record must not suffer from cold or heat, or insect pests, or hunger, or thirst, or disease. When big records are made in the middle west or eastern states conditions must be made favorable, artificially, during a considerable part of the year. But in California, in the Sacramento and San Joaquin valleys and elsewhere, the natural conditions are such as breeders strive to make artificially elsewhere. An annual average temperature of around 60 degrees, with no zero weather, with comparatively few days of intense heat, and wth long periods of days of even temperature, not too hot, so as to be enervating; cool enough night and morning to be invigorating, but not cooler than that—nothing could be more ideal than this. Couple with this favorable weather condition a rich soil and plenty of irrigation water to make an abundance of rich alfalfa, corn, silage and grain, and it makes a dairy cow's paradise. Thoughtful students of the situation have long predicted that these rich lands of California would some day be the home of the greatest dairy cattle in the world. The prediction has now come true.

Such a combination of factors—cattle, men, conditions—have made, are making and will continue to make world's records and world's record dairy history.

PROPER USE OF "THOROUGHBRED"

The more common of the terms used to indicate lineage are thoroughbred, pure-bred, cross-bred, grade and scrub. Thoroughbred in its strictest term means the English race horse. This was the original use of the word. The term pure-bred is used synonymous with full-blood. It indicates animals of well-defined breeding without admixture of other blood. In speaking of pedigreed Shorthorns, for instance, one should not say, "thoroughbred," but pure-bred.

If you want to start an argument around horse fanciers, just call a Percheron stallion, a Jersey bull or a Leghorn cock a "thoroughbred."

Economic milk production can only come from cows of large capacity that are well fed.

THE KEARNEY RANCH

(Continued from Page 579.)

mediately in charge of this enterprise, had definite and concrete recommendations to make.

In order for you to understand the situation fully I must briefly describe the present resources and activities of your college of agriculture and experiment station. The college of agriculture of the University of California is not located at Berkeley. It is located in California. It has now eight properties scattered about the state where the work of the college and station is conducted. It has placed farm advisers in nine counties.

At Berkeley its activities may be divided into four types: Research, post-graduate instruction, under graduate instruction and external instruction or extension work. Under this latter heading, may be mentioned our correspondence instruction in agriculture. The first correspondence lesson in agriculture was mailed from Berkeley on September 20, last year. There are now 10,700 persons registered in these courses. Through other extension activities it is estimated that we come in contact with 20,000 people, although I am not sure but that we count some people twice in making this estimate. At any rate our staff write more than 50,000 letters annually, largely in answer to inquiries, and we mail 500,000 circulars, bulletins and reports of our experimental work. There are between five and six hundred students studying agriculture at Berkeley. Walk across the Berkeley campus. Ask any young man you meet. One in six will tell you he is studying agriculture.

At the university farm at Davis, there are also at least four types of work. There are experiments with animals, including poultry, dairying, field crops, deciduous tree fruits and grapes. For example there are 500 varieties of grapes under test. There is conducted at the university farm a school for students who have reached college age but do not have the requirements for admission to the university, or for any others who may desire this type of instruction. There are conducted, as provided by law, short courses in various branches of agriculture. These begin this year on October 5 and continue six weeks. The fourth activity is instruction given during the second semester to university students who come from Berkeley for this purpose.

The first semester last year the attendance at the university farm school was 188. Already this semester the enrollment has reached 253, or an increase of 35 per cent. The normal increase of a state institution of learning is 15 per cent.

Last year at this time there were 47 applications for short courses. The applications this year have reached 99. Last year 61 university students received instruction at Davis. Not counting the same students twice it is probable that resident instruction in agriculture will be given to approximately 1,000 students at Berkeley and Davis while, as before stated, correspondence instruction is being given to over 10,000 persons. I will not stop to sketch the work at Riverside, Whittier and Imperial Valley. I will only state that each is a part of the greater whole.

A number of suggestions have been made concerning the way in which Kearney ranch may eventually contribute to the work of the college of agriculture. One suggestion has been that the net income from this ranch might be set aside for the study of some definite problem like tuberculosis. My own thought at first was that when the university farm at Davis had been developed to such a size as to be most economically administered then another unit along similar lines should be started at the Kearney ranch. At the Davis farm the emphasis would be placed upon livestock husbandry while at Kearney emphasis would be upon fruits and field crops.

However, as I have studied the situation further I have come to feel that a much greater service can be rendered to the state by establishing a school that shall be quite different from anything that has ever been undertaken — an institution which from its intrinsic value and uniqueness would attract the attention of the educational world. The institution such as I have in mind will not be a cheap institution in any sense of the word. If it is successful as I think it will be it is destined to revolutionize our ideas of education in general.

It costs not less than $120,000 annually to conduct the university farm at Davis. In addition the last legislature appropriated $135,000 for buildings. A lesser program would not be satisfactory for Kearney.

A great deal of study has been given to this problem. Among other things I have found, it is desirable to examine into the finance of the Kearney ranch to determine how far the profits might be applicable to the support of any enterprise which it may be finally determined as best for this location. You may be interested in this aspect of the matter. The comptroller of the university has furnished me the following figures:

Total profits of Kearney vineyards May 1, 1906 to June 30, 1914	$257,000
Estimated profits July 1, to June 30, 1915	30,000
Total	$287,000
Payment of mortgage and bonded indebtedness	$172,000
Total capital improvements including drainage experiment	35,000
Paid to the support and maintenance of the department of agriculture of the University of California for two years beginning July 1, 1913, and ending June 30, 1915, at the rate of $40,000 a year	80,000
Total	$287,000

It will thus be seen that the cost of conducting a suitable institution such as we want to see established at Kearney will require many times its present income.

STATE BEEKEEPERS' CONVENTION

The State Beekeepers' convention, which was to have been held in Los Angeles this week, has been postponed because of inability to get the use of the rooms of the Y. M. C. A. until December 16. On that morning the State Beekeepers' convention will be called together, and the sessions will continue through the 16th, 17th and 18th. Secretary Schaffner informs us that a good program has been arranged. Dr. A. J. Cook, state horticultural commissioner, will be present and will make an address. The convention will give general attention to matters of legislation which are of particular interest at this time, because of the nearness of the next session of the state legislature. There will be many addresses by practical beekeepers, and presumably a banquet will be one of the features of the convention.

Ventura County shipped 40 cars of beans during November.

BECAUSE SHE WON'T

If you are too lazy to open the door when fortune rings the bell, don't expect her to go to the back door and knock.

CALIFORNIA'S
TWO GREAT 1915
EXPOSITIONS
at San Francisco and San Diego will
open on schedule time

There will be
NO POSTPONEMENT
on account of the European War
or for any other reason

Ask each of them to mail a Postal to Some One Else, and the
Mail Man will spread the news

OPENING DATES AND DURATION OF EXPOSITIONS:
Panama-Pacific International Exposition at San Francisco
February 20 to December 4, 1915
Panama-California Exposition at San Diego
January 1 to December 31, 1915

Here are some convincing facts concerning the great
Exposition at San Francisco:

Not one of the 42 exhibiting foreign nations has withdrawn, while three of them have increased their participation.

Seven nations involved in war and five neutral European nations will have their own buildings.

Exhibits from eleven foreign countries have already arrived.

Forty-three of our States and one city are making individual exhibits.

Finally, these exhibitors are spending more money than previously expended in any two other Expositions.

Poultry for Profit

PASADENA POULTRY SHOW

Written for California Cultivator
By Frank J. Ironmonger

THE Pasadena Poultry, Pigeon and Pet Stock Association held its fourth annual exhibition December first to fifth with the usual pomp and splendor characteristic of Pasadena, the home of the millionaires.

The weather was ideal and the many chicken lovers were out to witness the display of fine feathers. The room in which the exhibition was held failed to meet the requirements of the association, but it was the best they could do The aisles were the same old story—too narrow for comfort, the light very poor and the darkest colored birds, that should have had the better light, were tucked away in dark places, a disappointing feature that is impossible to overcome where a poorly lighted room must be taken.

The officers, J. D. Nash, president; J H. Thompson, vice-president; J. H. Jones, treasurer, and M. D. Courtwright, secretary, are old time poultry fanciers and certainly understand pulling out a fine display of quality stock.

The classes were well filled with birds above the average usually seen in poultry shows, which made up for the deficiency in numbers. The poultry numbered 567 head, 176 of which were bantams and the five turkeys, two geese and nine ducks were not to be overlooked.

The judging was in the hands of W. S. Russell of Ottawa, Iowa, who is known by every poultry fancier from Maine to California, and when an exhibitor is honored with a score card bearing his signature they know it is correct. Mr. Russell has arranged his circuit this year so that he will handle a number of California's largest shows, and poultry raisers should make a strong effort to exhibit under him in order to know exactly and honestly what place their birds hold in the poultry world.

The standard varieties were judged by the score card system, while the non-standard varieties and bantams were judged by comparison. In passing through the aisles the experienced eye could plainly see that the association motto, viz, "Let the best bird win, no matter to whom it belongs," had been carried out to the letter. Each score card was tacked to the coop containing the bird scored, which was a great help to the public.

The bantams were a grand lot; the Black Cochins carrying off the honors for numbers. The Game Bantams came next, followed closely by the Sebrights. The bantams were passed on by Dr. Irwin C. Royce in the absence of Dr. Enos of Long Beach.

The association was very liberal in the cash premiums, offering $2.50 for first, $1.50 for second, $1.00 for third on single birds; $8.00 for first, $6.00 for second, $2.00 for third on exhibition pens. For Bantams, $1.25 for first, 75 cents for second, 50 cents for third on single birds; $4.00 for first, $3.00 for second, $1.00 for third on exhibition pens—eight to fill in each case.

Besides the regular ribbons by the association there were 11 silver cups, five gold coins, one incubator and 33 premiums from an umbrella to a year's subscription to some paper placed on the sweepsteak winners. On the Bantams there were 10 cups offered. The cash prizes and cups were big inducements for a large exhibit, especially for the novice who above all others should be encouraged. They are the life of the trade.

The pigeon display under the management of the Pasadena Pigeon Club, together with the rabbits, was staged in the second story of the building. Here the light was all that could be asked for and the specimens showed up in excellent shape.

The Pigeon Club has the honor of having the largest entry of pigeons ever recorded, numbering 750 birds. The Runts were the largest class, numbering 287, being 159 more than the world's record display of 128. The utility varieties were much stronger in numbers than in former shows where the fancy varieties were the main feature. The exhibitors report quite a number of sales ranging in price from $25 to $50 a specimen. Among the winners were birds imported from England and other countries. Mr. R. W. Wales of Iowa City, Iowa, and Mr. C. E. Lang of Buffalo, New York, judged the ornamental varieties, while Mr. R. V. Moore of Los Angeles judged the utility varieties. In addition to the liberal cash prizes and ribbons offered there were seven cups and trophies.

The rabbit display reminded one of the old-time days in California when Belgian hares and oil stock were all the go. The cages were full of fine specimens consisting of Belgian, Flemish Giants and New Zealand Reds.

Rabbits are fast gaining favor on the coast not merely as a fancy but principally as a source of fresh meat, and the prediction is that before very long a majority of families who are in a position to raise meat for their table will turn their attention to the quick maturing, economical and fast breeding Belgian hare.

All the rabbits were judged by Mr. R. V. Moore of Los Angeles, who is recognized as the best authority the coast has known. Several silver cups and special ribbons were offered, which brought out the 189 rabbits of quality.

Following is a list of the awards:

AMERICAN CLASS

White Rocks—J. H. Stearn, 1st ck, 1st and 2nd hen; George E. Richardson, 1st and 2nd ckl.

Barred Rocks—J. D. Nash, 1st ck, 3rd hen; Fred Espe, 1st hen, 1st pullet; Frank Wagner, 2nd hen, 2nd and 4th pullet, 1st, 2nd and 4th ckl.; Edwards, 2nd ck.; Vance, 3rd ckl.; McPherson, 3rd pullet; Mitchell, 5th pullet; E. E. Webster, 4th pen.

Partridge Rocks—Dr. Duncan, 1st hen, 1st pullet; J. E. Nash, 2nd hen; H. D. Armstrong, 1st ckl, 2nd pullet; Dr. Royce, 2nd ckl.; Dr. Duncan, 1st pen.

Buff Rocks—Kellenberger, 1st ck.; Mrs. Fred Morgan, 2nd and 3rd ck., 1st, 2nd, 3rd, 4th and 5th hen, 3rd ckl., and 1st, 3rd and 4th pullet; A. F. Carlton, 4th ck.; L. M. Colby, 2nd and 5th pullet; Fred Morgan, 1st pen.

White Wyandottes—B. B. Baer, 1st ck.; M. D. Cartwright, 1st and 3rd hen, 1st and 2nd pullet; W. F. Smith, 2nd hen, 1st ckl.; McLuckie, 4th hen; Z. E. Durham, 4th ckl.; J. E. Klepper, 2nd and 5th ckl., 3rd, 4th and 5th pullet.

Medal for best Black Cochin Bantam shown by novice—Truman Johnson.

POULTRY NOTES

A London remedy for roup is about three drops of camphor on a piece of bread.

A fair hatch of strong, healthy chicks is to be preferred to a greater number of weak ones.

Some tell the sex of a guinea fowl by its wattles. Those of the male are double the size of the female.

Plant sunflowers along the edges of the poultry yards for shade in summer and feed in fall and winter.

A head louse on a chick is easy to find, but it takes a sharp eye to locate the mites. Keep after them.

A gentle mother makes gentle chicks. When the mother hen is wild and flighty it is hard to tame her young.

Breed every year from the strongest, best developed fowls and especially from those of good laying qualities.

Never grease the hen that is setting, as grease getting on the shells of the eggs will close the pores and smother the chickens.

Be careful about feeding cornmeal wet up. It is all right as a change as the chick grows, but not as a steady diet—too heating and constipating.

Nature provides food for the chicks the first 48 hours of their lives. Some poultry keepers supplement this with some fine grit and fresh water.

Make the nests big enough so the hens can get in and out without breaking the eggs. Make the entrance to the nests from the back to make them dark.

Do not forget that in the composition of an egg there is a great proportion of water, and the laying hen can not produce eggs unless she has all the water she wants, and at the time she wants it.

Cull the flock closely. Keep the best and prepare the rest for market.

Enrich the garden plot with the poultry droppings.

Constant thought and judgment are necessary in poultry raising.—Western Farmer.

Do not slay the hen that laid the golden egg nor withhold feed from the hen that lays eggs worth 50 cents a dozen.

No man who does not like a hen, who cannot see beauty or excellence in a hen, and who feels like kicking her or shooing her away whenever she comes near, will ever succeed as a poultryman.

Another year's egg laying test began November 1 at the Missouri Experiment station at Mountain View. The tests at this station are watched with interest by poultry people all over the world.

NOT YET DETERMINED.

"What's that new structure you have put up on the hill there?"

"Well," replied Farmer Corntossel, "if I rent it, it's a bungalow. If I don't, it's a barn."—Washington Star.

INDUSTRIAL OPPORTUNITIES

From Address by Geo. Otis Smith, Director Geological Survey

Four constituents enter into the reaction that we term industry. Two of these, brain and brawn, are organic compounds and two are perhaps to be regarded as inorganic—money and material. None of these components is wanting here in the United States and in fact their abundance affords the best reason for an optimistic outlook upon the present industrial situation. Of these four constituents, labor and capital and brains are all more easily transported generally than the crude materials upon large tonnages of which the industry must depend. Thus, cheap coal attracts manufacturers just as cheap land attracts farmers.

With distribution of raw material is linked the influence of markets upon the location of industry. The development of transportation systems makes the problem of markets a most complex one. The industrial independence of the small community of a century ago has given way to the system under which your dinner table may represent the tribute from several continents. Even in a country so diversified as ours in its natural bounties, domestic production of everything consumed is not desirable nor profitable. Exchange of commodities with foreign countries becomes necessary, so it follows that industrial independence is the goal toward which a nation should face, but not a goal which it should have either the intention or desire to attain.

To increase industrial prosperity this country needs to export finished rather than crude products and to import raw materials rather than manufactures. It is the product of American labor rather than the bounty of our natural resources that preferably should go into the world's markets. As the engineers of America study this matter of expansion of manufacturing, it becomes evident that the distribution of raw material and of power is the key to industrial opportunities.

Petroleum and natural gas in their distribution in some degree supplement coal. Thus, the largest oil field, both in present production and probable reserve, is in California, a state with only negligible coal resources. Taken together, these mineral fuels constitute a national asset comparable with the soil resources of this country, but the larger part of the value of the natural gas, petroleum, and coal to the nation is in their relation to manufactures.

The wide distribution of ores of the principal metals sufficiently rich and extensive to be mined in large quantities means that the metallurgical industry is important on both the Pacific and the Atlantic seaboard, in most of the Rocky Mountain states as well as in several of the middle states. Even in the two metals which at once suggest to us centralization—copper and steel—there is widespread production. In the mining of copper last year 23 states contributed, and no less than 28 states furnished iron ores to the furnaces of the country.

The raw material resources of this country are so widely distributed that industry has been developing at this rapid pace at many points. The tendency is away from geographical centralization of industry rather than toward it. A few opportunities for expansion need only to be suggested: The south with its happy combination of coal and iron-ore in the same districts makes pig-iron production possible at minimum cost; the west with its hydro-electric possibilities available as a source of relatively cheap power for chemical and metallurgical industries; the Rocky Mountain region with its vast unutilized sources of sulphuric acid and equally great unmined stores of phosphate rock.

The ingredients necessary for producing prosperity appear at hand. The new financial system already promises more mobile credits. A more sympathetic attitude of the public toward big industrial operations is indicated. The efficiency of American labor and American engineering was never questioned.

In any estimate of American ability to make the most of the present opportunities for industrial expansion, no better measure of the inventive genius of this country can perhaps be found than in a moment's review of what is making the European war so terrible. Strictly neutral may we be, yet from the heights above to the depths below we find American inventions "at the front"—the aeroplane, the magazine rifle and machine gun, the barbed wire, and the submarine and its torpedo. Can not our nation lead as well in fashioning the tools of peace as in designing the machines of war?

WHEPLEY PERSIMMON

An exhibit of particular interest among many others made at the recent State Fruit Growers' Convention in Los Angeles was that of some persimmons grown in Tulare County by Mr. Wm. L. Whepley of Lemon Cove. These persimmons have been given the name of Whepley. The fruit is apparently a seedling of medium size and exceptionally fine quality.

Exhibits of fruit and orchard appliances should be encouraged at these state conventions. In some particulars the exhibits are as educational as are the addresses.

DAIRY STOCK SHOULD BE DEHORNED

Except in the case of cattle that are to be used for exhibition purposes all dairy animals should be dehorned. In the wild state cattle needed horns for protection, but in the present state of domestication horns serve no useful purpose and are a source of considerable annoyance.

On the adult animal the horns may be removed by the use of the saw or clipper. In either case the cut should be close enough to the head to leave a ring of hair on the part that is removed, otherwise there is likely to be a stubby growth of horn appear in the course of a year or two.

The best and least cruel method of removing horns is by means of an application of caustic potash to the horn buttons while the calf is from one to four days old. The hair is carefully clipped from the buttons and the moistened end of a stick of caustic potash is then rubbed on the spot until the skin bleeds slightly. Care should be taken to prevent the liquid caustic from running off the button, but if only a small amount is rubbed on there will be no danger from this source. If the caustic has been properly applied there will be a dent in the skull where the button appeared and no horns will develop.—A. B. Nystrom, Dairy Husbandman, Washington Agricultural College.

YOUTH'S COMPANION CALENDAR

The publishers of The Youth's Companion will, as always at this season, present to every subscriber whose subscription is paid for 1915, a calendar for the new year. The decorative mounting is rich, but the main purpose has been to produce a calendar that is useful, and that purpose has been achieved. Subscriptions received at the Cultivator office.

Questions and Answers

THE EDITOR AND STAFF

Rabbit's Age

How can I tell the age of a rabbit?—Subscriber, Sacramento.

There are no sure methods of telling the age of a rabbit except in old specimens. They usually have such long claws, especially on their hind legs, and their eyes are dim or expressionless, and many of the extremely old specimens are affected with cataracts or styes in their eyes, or are near-sighted.—R. V. M.

Pure-bred Rabbit

How can I tell a pure-bred rabbit?—Subscriber, Sacramento.

Would advise you to seek the services of some friend or rabbit fancier posted on the merits of the breed you are interested in and if such an individual is not available or there is no rabbit show near at hand to exhibit your specimens, would advise you to get a book on standards of the different varieties, published by the Pacific Pet Stock Association, and which is obtainable at this office for 25 cents per copy. This book is illustrated and gives a complete standard of all the popular recognized breeds and is indispensable to anyone breeding rabbits who wishes to follow the standards and points in each breed.—R. V. M.

Apricots on Walnuts

Can apricots be grafted on walnuts?—Subscriber, Campbell.

Hardly. Stone fruits will usually "take" on each other, but the walnut would rebel.

Plow Under Kafir

What effect on soil would plowing under kafir corn stalks have? I am told that as the stalks are somewhat sweet that the process of decay will create too much acid in the soil.—Subscriber, Angiola.

We think there is no trouble whatever from any acid which may be in the stalks. If enough moisture is given to rot down the dryer parts of the matter the soil will be benefited. Orange growers felt at one time that the acid of cull fruit should bar them for use as fertilizers or mulch, but tests showed no ill results from either orange or lemon culls applied to orchards. California soils are usually abundantly supplied with lime, which quickly neutralizes acid formations. Note we say "usually". There are exceptions which an application of limestone or air slacked lime will correct. Plow under the stalks.

Improved Tuscan

There is a party here who is boosting what he calls Southern Tuscan Cling peach trees and claims they are superior to the ordinary Tuscan Cling peach or Northern Tuscans as he calls them. What does the Cultivator know about it? Is it another tree graft or are there two kinds of Tuscans?—Subscriber, Hemet.

We know nothing of the peach referred to. Unless the peach is recommended by good authority, plant sparingly till tested. Have any subscribers tested this peach?

Not True to Name

To what extent is a nursery company liable for damages caused by selling worthless trees or trees not true to name, and how should one proceed when the trees have been shipped in from outside the state and the agent here is not worth anything? Would it make any difference if the land that the trees are planted on has changed hands since the trees were planted?—Subscriber, Hemet.

Only to the extent of the cost paid by the purchaser. However, in case of dishonesty, or extreme carelessness, suit might force a settlement on reasonable terms.

Guinea Fowl Bulletin

If "Subscriber, Calipatria," who asks about guinea fowls in Cultivator of November 26, wishes reliable information regarding them, let him write to department of agriculture, Washington, D. C., for Farmers' Bulletin No. 234, entitled "The Guinea Fowl and Its Use as Food." It is free for the asking.—Levi C. Kincaid, National City.

Bleaching Almonds

How much sulphur is required and how long should it be kept burning under them; should they be dampened with water and will apricot trays do?. Will the same process do for almonds? If I belonged to the Almond Growers' Exchange they would buy my nuts and attend to bleaching, but they handle no nuts outside the organization.—Subscriber, Greenfield.

The same outfit used for bleaching almonds is used for bleaching apricots. Sprinkle the almonds just before placing them in the bleacher. Stir them while sprinkling so as to moisten them on all sides. Place on the trays and sulphur the same as when drying fruit. One hour in the bleacher is time enough.

Sulphuring will not injure the hard and soft shell varieties but it will ruin the flavor of the paper shells. They immediately lose their flavor and soon become soured.

If you could find a market for the kernels it would pay to shell them. We one time marketed a batch of paper shells in that form. We rigged up a home-made sheller by putting a square pole through the ends of a barrel and putting a crank on one end of the pole, making the pole round at two points a few inches from the end of the barrel. The pole made a shaft running through the barrel; it was set on a stand and made to revolve like a churn. A large opening was made in one side of the barrel. This was hinged like a door through which the almonds were put in and taken out.

About a bushel of almonds is put in with a couple of round sticks of wood about five inches in diameter. When this is revolved at moderate speed a few minutes most of the shells will be broken, when the kernels are easily separated with a fanning mill.

The simplest and cheapest way is to join the Almond Growers' Exchange.

Guinea Fowls

The reference in the query department made by our contributor, "J. A. K.," in effect that the effort to boom the guinea fowl has not yet reached California, and that there is no market for the bird, has called forth a mild protest from a subscriber. Mr. C. J. K. Jones of Orange writes: "I am much amused and also filled

The Old Reliable

San Dimas Citrus Nurseries

Established 1890
Incorporated 1913

Citrus Trees Exclusively

All Leading Varieties

REMEMBER, MR. PLANTER

Practically anybody can grow a citrus tree, but it takes years of experience to produce a tree that will prove a money-maker when it comes into bearing. Nice-appearing nursery trees are desirable and promising, but do not always prove to be good bearing trees in the long run. Plant for profit and not for appearance only. Our trees are straight, thrifty, well rooted and have strong, full heads, but the main consideration is that: Our buds are carefully selected from heavy fruiting trees and will prove true-to-name revenue producers.

OUR TWENTY-FOUR YEARS

of experience in the growing and handling of citrus nursery trees gives the buyer the advantage of starting out RIGHT, thus avoiding disappointment at the end of four or five years' labor in bringing the young orchard into bearing.

ANOTHER POINT TO CONSIDER

Growing a good tree is only part of having it do well after planting. Many a good tree is ruined in the taking up from the nursery and shipping. We give the best of service in the proper handling and delivering of our trees.

WRITE,

'phone or call on us before buying your trees. Tell us your wants and we shall be glad to give you the benefit of our wide experience as to planting, soil conditions, fertilizers, etc.

Our illustrated new booklet on citrus culture mailed to any address upon receipt of 25 cents.

with sympathy for the unfortunate people who do not know that guinea eggs are the best and most easily digested of all eggs from domestic fowls, and that a six-months-old guinea hen, split on the back and broiled, is the richest and most delicate meat of all poultry. Notwithstanding, each and all and sundry, we are informed that there is no demand for them for the table, and their eggs have no market value. Perhaps not, yes."

Arkansas Black

Please name the apple which I send you.—Subscriber, Santa Ana.

This apple was submitted to a large fruit handler and to a nurseryman, and while neither would be positive because of the fact that apples vary according to the locality in which they are grown, the first guess of each of them was that this was the Arkansas Black.

Pea Fowl

Are there any birds in California called pea fowls or peacocks, or Chinese pheasants? Have never seen them advertised in the Cultivator.—Subscriber, Nestor.

We think Chinese pheasants may be secured of T. D. Morris, Aqua Caliente, or of Kellogg Orange Acres, Bakersfield, Kern Station.

As to pea fowls, there are many of them in California, but we do not now have the names of breeders, unless perhaps the above-named parties, who were, we think, at one time advertising them, may supply you. Would suggest that these breeders, if they care to sell their stock, will probably find a market through the columns of the Cultivator.

Apricot Trees Dying

Many of my three-year-old apricot trees are dying and all show branches dying back. Cutting off these branches shows no beneficial effect. I send a section of one of the branches which shows a peculiar appearance of the center or heart wood with darkened appearance around it. Is this a physical condition caused by soil? There is three feet of good sediment soil, two feet of hard gumbo and underneath, sandy clay. Will dynamite prove beneficial? Satsuma plums adjoining the apricot trees are also showing some gum trouble.—Subscriber, Santa Ana.

As to any fungous trouble, we have the following from Professor Fawcett:

"I did not find any bacterial or fungous trouble on this branch. There is a discoloration of the wood tissue which we have sometimes seen in apricot branches, but sometimes this condition is found even in what seemed to be healthy branches that are not dying back, so I cannot throw any light on the subject from the specimen."

Mr. J. W. Mills advises:

"The apricot branch showing signs of disease indicates sap trouble. The statement that there is a hard subsoil impervious to water close to the surface, in my mind, explains the trouble. Apricot and peach roots will stand in water a long time during cold weather without injury, but if such conditions continue into warm weather a fermentation of the sap will set in and the trees will die.

"We had just such an unpleasant experience years ago in Yuba County. A mixed orchard of peach on peach root, cherries, plums on plum root, and Bartlett pears were planted on ground with a stiff yellow clay subsoil. All varieties flourished till they were about four years old, when heavy rains continued into May. All the peach and cherry trees died after they had blossomed and were half leafed out. The pear and prune trees were not affected, and grew to be thrifty and productive."

Regarding the use of dynamite. If this could be done at a time when the ground is not too full of moisture it might prove beneficial. Drill one-half or two-thirds of the way through the gumbo, making a few tests as to what depth will give best results. The point is to place the dynamite so as to break through the gumbo into the lower stratum of sandy soil. If the dynamite is put below the stratum of heavy soil it is reasonably sure to blow a big pothole in the softer soil. As noted, be careful not to use this process when the soil is wet, for then, instead of shattering and breaking up the hard soil it is more liable to pot-hole and injure it.

Answers in this column by Dr. Wm Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal

---

Hog Cholera Serum

Can hog cholera serum and the needles or syringes for using it be purchased on the Coast? Is it unlawful for a person, not a veterinarian, to vaccinate hogs other than his own? About what would it cost if the county veterinarian was employed for this work?—Subscriber, Lancaster.

The hog cholera serum can be obtained from the agricultural department of the University of California at Berkeley. They may also carry a supply of the syringes, but they can be obtained from any surgical instrument store through your druggist. There is a law that is supposed to prevent such work being done by anyone but a qualified veterinarian. The county veterinarian would charge the same for time spent at vaccinating hogs as he would for any other work. There is no regular price set for it.—W. P.

Faulty Gait

I have a young stallion, coming three years old, that I am just breaking. I only drive him two or three miles at a time but he has developed what some people tell me is skelping. When he trots he strikes his hind foot against his front, hitting the hind foot about midway between the toe and the hair on both feet. When he does this he breaks and tries to run. How shall I have him shod to remedy this?—Subscriber, Morgan Hill.

Your colt is rather young for fast driving. You had better let him develop a little more; perhaps he will learn to travel wider behind. The proper shoeing for such a horse is to leave the toes of the hind feet long and cut the toes of the front feet short, rounding the toe of the front shoes a little. This will help him to break over a little quicker on the front feet and retard the hind feet enough to let the front feet get out of the way. A little more weight in the toes of the front shoes or toe weights will help some and reining him a notch higher will also help. Some horses are so short coupled that it is difficult for them to learn to travel without skelping and with some it is necessary to weld a thin piece of iron on the toe of the hind shoe, letting it extend up the front of the foot to prevent them wearing a hole clear through the wall of the foot.

Injury

I would like some advice about a crippled mare. The mare was hurt in a runaway in August. In jumping over a disk harrow she struck the

front of her hind leg, above the ankle, on the iron frame of the harrow and cut or scraped the skin and flesh from the bone about six inches long, leaving it in a lump at the top of the wound. We applied black oil and kept it clean with soap and water and peroxide. It has not healed, but a lump of reddish flesh or gristle has grown in the wound until it is as large as my fist and is still growing. Please advise what to do with it.—Subscriber, Thermal.

When the leg was first injured you should have washed it clean and pulled the skin down to its place and put a bandage on. However, that is not what you want now. The lump should be removed by cutting it off with a sharp knife; the large blood vessels touched with a hot iron and then bind on an ounce of Monsel's iron powder. You can get the powder of your druggist. Put it on some surgeon's cotton and place it against the wound, then put on a bandage and leave it for a week. If you can not get it cut off you might try using the powder and apply it several times, leaving it on several days each time. After the lump is reduced it will only be necessary to keep the edges soft with a little bacon fat.

Spavin

Should bog and bone spavin have the same treatment? What treatment is the best and what are the lasting bad effects of the above troubles on the horse?—Subscriber, Tulare.

The treatment of bog and bone spavin generally is about the same. If either one is very bad the best treatment is to fire and blister it. The bad effect in either case, after the soreness is gone, is a slight stiffness of the joint which interferes with the speed and the smoothness of the gait.

Bots

Will you kindly give me a remedy for bots? I have a mule that I have doctored for colic and kidney trouble without success and now feel sure that he has bots. It comes on in violent attacks and he drops down wherever he is and lies on his back with his legs straight up and seems in great pain. It comes on after a long drive or if kept too long without feed.—Subscriber, Warner's Springs.

So far there has been no remedy discovered that will rid an animal of bots. When they are fully developed they will loosen their hold on the stomach and pass out with the feces. The symptoms that you describe would indicate that the mule has spasmodic colic or possibly an internal hernia. The following medicines will act as a tonic and probably relieve the trouble: Powdered gentian six ounces, powdered nux vomica three ounces, sulphate of iron three ounces and bicarbonate of soda four ounces. This will make one pound, and when you get it mix it with one pound of salt and half a pound of wood ashes. Give a tablespoon once a day.

Fails to Breed

Please give treatment for 18-months-old Jersey heifer that will not breed. She is in good condition and has plenty of exercise.—Subscriber, Rio Bravo.

You will find answer to a similar question in the Cultivator of December 3, on page 575.

Cholera Possibly

Lost sow with pigs four days old. Sick four days. Breathing labored. Two hemorrhages from nose before death. After death found lungs very small, inflamed and full of sores. Liver more than twice natural size. Entrails covered with clear sacks of yellowish liquid. Other organs natural. Was this tuberculosis or pneumonia?—Subscriber, Rio Bravo.

It sounds very much like cholera only the sickness was of short duration. Cholera affects the lungs and bowels much as you describe. It also affects the spleen and it too is usually enlarged, but you may not have noticed that.

Sick Hogs

Have had hogs sick three months. Lost several after two months. They were constipated at first then ran off at bowels until death. Ate fairly well even when unable to stand. Sows lost pigs sometime before death. Some had very sore mouth and one or more sore feet. Veterinarian pronounced it cholera and foot and mouth disease but did not quarantine. He opened none of those that died so can give no more symptoms. Is there a kind of cholera with which hogs are sick so long? Do you think the real foot and mouth disease exists here? These hogs have been in the neighborhood two years.—Subscriber, Kern County.

The real foot and mouth disease is not known to exist in California, but if your veterinarian thought it was such he should and probably would have reported it to the state veterinarian. Where an outbreak of cholera is not too violent the hogs often live several weeks and often some of them get well again. There is a disease in California that does affect hogs by causing ulcers in the mouth and sore feet, and is very severe on little pigs, that might truly be called foot and mouth disease, but is not the real foot and mouth disease that is giving so much trouble at present in our eastern states. We hope it will not reach here.

Screw Worms

In regard to "Screw Worms" in the Cultivator of October 29, 1914, in Veterinary Queries. My experience with the fly in Texas is that it does not lay an egg, but a live maggot with a hard black head, that starts boring into the sore or any place that has fresh blood on it. It is a bad pest in the shearing corrals of Texas, and all cuts and blood spots have to be spotted with sheep dip, calomel ointment, or some dip much stronger than will be required to kill the ordinary white maggot. The worm sticks his black head out above the flesh of the sore into the air when not working. I think any Texas stockman or sheep shearer will confirm what I have stated above.—W. A. Maddux.

SAXON

For service on the rough country roads, the NEW SAXON CAR has proved its remarkable stability. Its short wheel base makes it possible to dodge the holes, and its splendid spring suspension makes "hitting the bumps" only a trifle.

Sid Boerstler, of Brawley, drives his car back and forth to Los Angeles, and says he enjoys every foot of the way. He declares it ideal for desert work, as it will not overheat.

To maintain the NEW SAXON costs only a few pennies. It was driven from Tiffin, Ohio, to Los Angeles at a cost for supplies of only $38.70. Ever hear the equal of that feat?

The price—$460. Electrically equipped, $530.

Restraint of Trade

A has a trade, but no capital. B has capital. A wishes B to stake him at his trade. B does so and they enter into partnership. B, to protect his capital, inserts the following clause in the partnership contract: "Neither one of the partners shall either by himself or with any other person or persons, directly or indirectly engage in the (such and such business) as long as the firm's name is in existence." Is this in restraint of trade? —Subscriber.

As to a sale of the business your contract would be void, being in restraint of trade, in that the clause should specify the county, city or part thereof, but not being a sale of the business and being a partnership it falls within a different class in that a general partner may not engage in any business which gives him an interest adverse to that of the partnership, and all profits made by general partner in the course of any business usually carried on by the partnership belong to the firm.

Telephone Poles

A bought a piece of land (unimproved) from B then found that a telephone line ran diagonally across this land. B stated that he never granted the company permission to take this step, and has no papers pertaining to this matter. The line has been there for about four years. A asked the company to remove the eight poles and set them along the road, and the company sent out several officials who conferred with A regarding the removal of the poles. They agreed to remove the poles within the desired time, but no papers were made out. If they remove the poles and set them along the road can the company force A to help pay for the expense incurred in this work? Or, if the company fails to do as agreed can A take any steps to force the company to remove the line?—Subscriber, Orange.

If the company has no right-of-way upon the property their lines may be removed just as the property of any trespasser.

Workmen's Compensation

In case of injury to an employe, what should he do to obtain compensation under the employers' liability act?—Subscriber, Parlier.

From the statement of facts in the above inquiry, which has not been set forth at length, it would seem that the employing company would be liable for a defective pump, especially where it had been notified of the defect. In order to obtain compensation, unless the employer has actual knowledge of the accident, the employe should, within thirty days after the occurrence, give such employer notice in writing, stating the name and address of persons injured, time and place where the accident occurred, and nature of the injury, and within sixty days file with the indus-

BE YOURSELF A STAR!

The pessimist firefly sat on a weed
In the dark of a moonless night;
With folded wings drooped over his breast
He moped and he moaned for light.
"There is nothing but weeds on the earth," said he,
"And there isn't a star in the sky."

"Then be your own star! then be your own star!"
An optimist firefly said,
"If you'll leap from your weed, and will open your wings
And bravely fly afar,
You will find you will shine like a star yourself,
You will be yourself a star;
Yes, the thing you need
Is to leap from your weed
And be yourself a star."—Sam Walter Foss.

THE CHILDREN'S READING

Written for California Cultivator
By Jean A. Koethen

SOME thirteen years ago when my twin son and daughter were three years old I had occasion to give before a meeting of women my idea in regard to the mother's direction of her children's reading. My theories were criticised at the time as good but impractical, and as I had not tried them out I could not prove that they were practical. Now I have tried them out, and I know what I suspected before, that it is quite possible for a mother to lead her children into such paths that whatever they get or do not get elsewhere, they may have all their lives the company and inspiration of the world's greatest thinkers.

Every sort of theory must have at least one leg to stand on. Mine has four.

1. Every child will read something.
2. The German proverb, "Der Mensch ist was er isst" (A man is what he eats) might well be paraphrased, "A man is what he reads," so true is it that one's taste in literature very largely forms his character.
3. The taste for what is elevating must be formed at home; schools have but little time for it.
4. It must be formed in the impressionable years between four and fourteen. Few people who have not at the age of sixteen acquired a taste for the best and a discrimination which enables them to choose between the real thing and the imitation will ever acquire either taste or discrimination.

We began, of course, with fairy stories. Why "of course?" Some of my best friends have taken issue with me on that point. They object: "Why not give them true stories? Why not fill their minds with facts instead of fancy?" Why, dear objector, because to the child mind fairy stories are true stories. Your normal child lives in a world of romance, just as all primitive peoples do. Elves and fays and giants and ogres are perfectly real to him, though he knows they never existed. Every nation has passed through its time of childhood, and the stories which were passed from lip to lip in the childhood of the race are the stories which belong to the child of every race.

But why sneer at fairy stories as being mere fabrications? The deepest moral truths, the profoundest philosophy, run like a silver thread through nearly all of them. In that simplest tale, "The Sleeping Beauty," the kind wish of a kind heart breaks the power of evil. In Anderson's story of "The Twelve Swans," in which twelve brothers are turned into swans by a wicked enchantress and can only be set free by their young sister who must weave twelve shirts from nettle leaves without speaking one word till the task was finished, the ultimate triumph of self-sacrificing love is shown as clearly as it ever was in any "Sunday school" story. Lowell's immortal words,

Truth forever on the scaffold, wrong forever on the throne,
But the scaffold sways the future, and behind the dim unknown
Standeth God within the shadow, keeping watch above His own,

may be said of the profound philosophy of these simple fairy tales just as truly as of the wanderings of the Chosen on the plains of Judea 5000 years ago. All real literature—I mean all literature which outlasts the generation in which it was produced—whether fairy tale, novel, poem or drama, has this moral quality. It must depict vice as bad and goodness as admirable, evil punished and virtue rewarded, or it cannot "hold the mirror up to life."

We have been fortunate all these years in having access to a city library, and so we have been able to study the fairy tales of all nations and to see how this thought of the ultimate triumph of good over evil runs through them all. Some of the best of them, like the story of the "Twelve Swans," are found with slight variations in many languages, but there is nothing more typical than the compilations of Grimm and Anderson, and these may be had very cheaply and should be in every home where there are children.

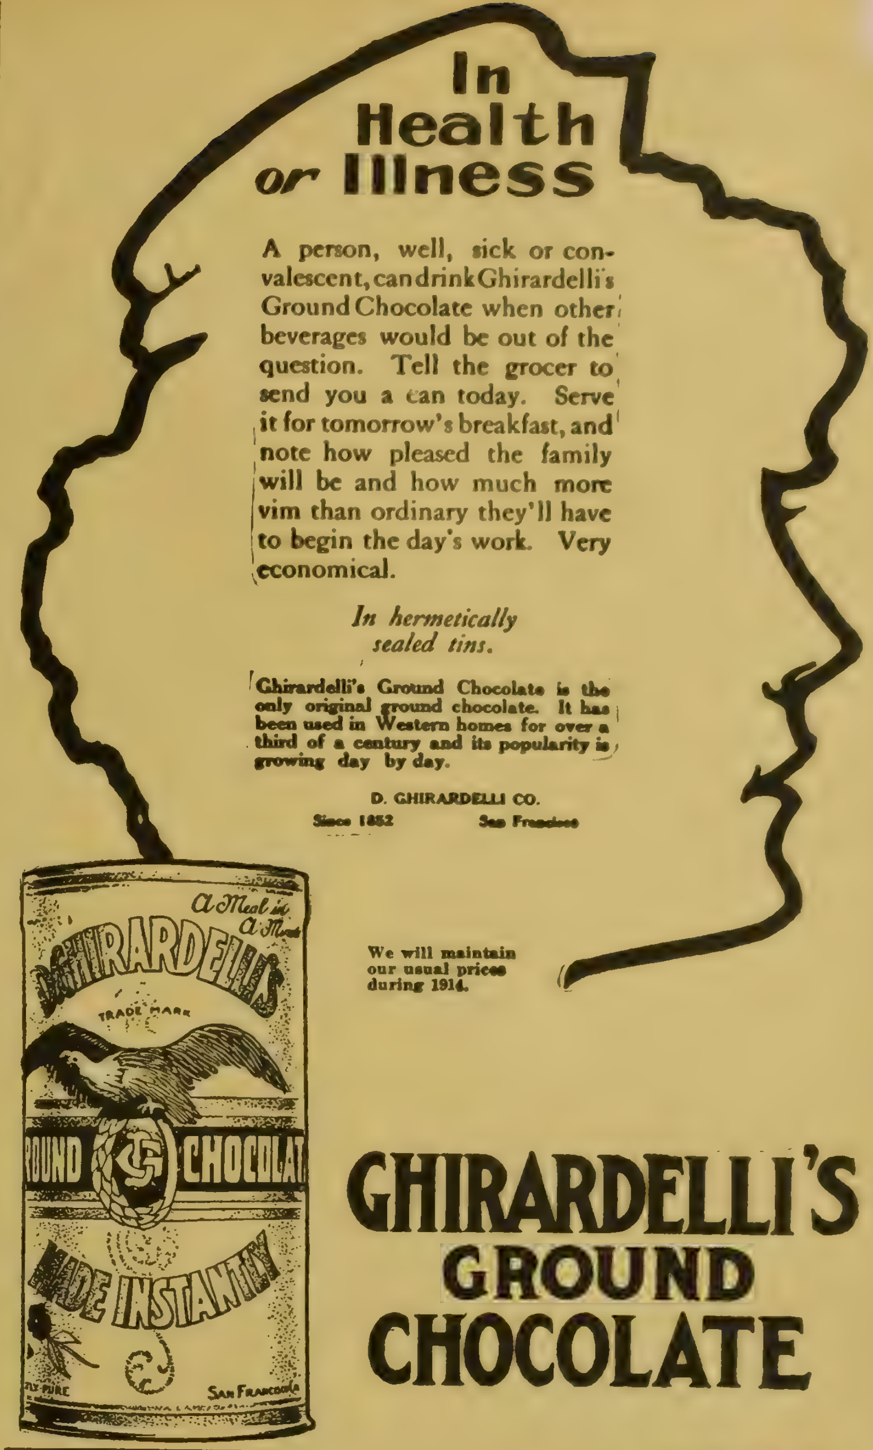
When Dorothy was six and a half she had to go to the hospital for an operation, and it was there, through the kindness of another child patient, that we were introduced to "The Wonderful Wizard of Oz," one of the wisest tales that was ever written. She heard it through twice at the hospital and again at home, and then she and her brother began to read it for themselves. They almost learned to read out of that book. Mr. Baum has written many other good stories, and we have read them all, some more than once, but not one even approaches "The Wizard of Oz." I should not know how to bring up a child without it.

It was time now for something heavier, and about the time the children entered school we began on the legends of King Arthur and the Round Table. These legends are the very foundation of English literature, and I have never been able to understand why they are so neglected in the public schools. The moral truth underlying the search for the Holy Grail is as profound as can be found anywhere.

"His strength is as the strength of ten
Because his heart is pure."

is a bit of philosophy no boy can learn too early.

From the Arthurian legends, on



In Health or Illness

A person, well, sick or convalescent, can drink Ghirardelli's Ground Chocolate when other beverages would be out of the question. Tell the grocer to send you a can today. Serve it for tomorrow's breakfast, and note how pleased the family will be and how much more vim than ordinary they'll have to begin the day's work. Very economical.

In hermetically sealed tins.

Ghirardelli's Ground Chocolate is the only original ground chocolate. It has been used in Western homes for over a third of a century and its popularity is growing day by day.

which we spent a good many months, it was only a step to mythology. We began with the myths of Greece and Rome, but were able, because of our access to the library, to dip into the myths and legends of India, China, Persia and nearly every other nation. These myths were read and told and read and told again at intervals for the next five years. Perhaps I ought to explain here that my children have a father who is an indefatigable reader and story teller. I should have given up in utter weariness and despair, for I do not like to tell stories, and I can never remember the labors of Hercules or the wanderings of Europa—probably because I was not brought up on them as my children have been.

We did not devote ourselves entirely to myths and legends all this time. There were other stories—"Alice in Wonderland," Kingsley's "Water Babies," "The Arabian Nights," "Robinson Crusoe," McDonald's "At the Back of the North Wind," "The Little Lame Prince" and many others I do not remember now, all of a sort which might be grouped together under the name "classics."

The children were ten or eleven when we made our first excursion into the realm of fiction. I have always believed that Dickens must be read early or never, so we started in about this time on "David Copperfield." It was a little heavy, and we concluded it was best to let Dickens wait a year or so. We did wade through this one story, but we read it again later and enjoyed it much more. Twelve or thirteen is young enough for Dickens, but sixteen is too old, if one has not commenced before.

We read "Dombey and Son," "Martin Chuzzlewit," "Pickwick Papers," "Bleak House," "Old Curiosity Shop," 'Nicholas Nickleby," "David Copperfield and "Tale of Two Cities." "Oliver Twist" we did not have the courage to try. It is too gruesome for children. The "Tale of Two Cities" is to my mind one of the greatest of historical novels. Volumes of history would not leave on a youthful mind the picture it leaves of the French revolution.

As the children were now in high school and studying ancient history, we tried to find historical novels which would fit in with their school work. Those of Ebers' seemed best for this purpose, and we found "Uarda," "The Bride of the Nile" and "An Egyptian Princess" very much worth while. We had tried before this to become interested in Scott, but except for "Ivanhoe," none of us could quite manage it. It is a great pity Scott is so difficult to read, but we are going to try "Kenilworth" and "Waverly" again and find out just where the trouble lies.

Probably some of my readers will be shocked when I confess that we turned from this rather solid reading to pirate stories with a good deal of joy. I don't think I ever enjoyed anything more than I did "Treasure Island," as I saw it through the children's eyes. We went about the house reciting

"Fifteen men on the dead man's chest,
Yo, ho, ho and a bottle of rum"

with real piratical thrills. There were several other stories of the same sort: "Kidnapped" was one, "Prisoners of Hope," by an author whose name I do not remember, and Cooper's "Pilot and Spy." "The Master of Ballantrae" we were a little leary of because there are horrors in in which I do not like for children.

Possibly some one asks, "Why have you omitted Miss Alcott's stories, which should naturally come in at this time? Just for this reason: Miss Alcott's stories are not classics, and some of them contain little hints at boy and girl love affairs which we did not consider profitable. We did read "Jack and Jill," and were disappointed. If boys and girls of this age must have love stories, and they must, for it is part of life, let it be the real, big, romantic sort, like Lorna Doone, which we read when they were thirteen or fourteen. If there is one novel in the English language that is more nearly above criticism than any other, it is this story of country life and love in the old days. The breath of the hills is in it, the rush of the mountain torrent and the freshness and buoyancy of life in the open. Kipling's "Kim," which we read during the same period, we enjoyed almost as much as Lorna Doone." It is a wonderfully vivid picture of British life in India, and with its boy hero is particularly suited for adolescent boys and girls. The scenes in this, too, are laid out of doors, and one hears the call of the hills as well as the steady tramp of feet as the countless hordes of this caste-ridden nation come and go.

I must confess to a great fondness for outdoor novels, piratical or otherwise, and we found in "The Shepherd of the Hills" and "The Heart of the Hills' 'the same atmosphere we had loved in "Lorna Doone" and "Kim."

After the children reached the third year in high school their school duties made it impossible for us to read as regularly as we had before, but we found time for several of the Sherlock Holmes stories, and have commenced "The Count of Monte Cristo," which I think must be the longest novel in any language. It is certainly the least profitable thing we have tried, in spite of its great reputation, and I never expect to finish it.

This list does not by any means comprise all we have read, but includes, I think, the novels and stories which are typical—just "hits the high spots," as it were. A family which had not access to a good library could not, of course, do as much, but many of these standard novels can be had very cheaply in the department stores. I have often seen stories of Dickens offered for 25 cents, and Scott and Thackeray are as cheap. It is the new things that are expensive.

Some one will doubtless ask, as I have been asked before, "Why not more history and less fiction?" There are several reasons. One is that the children were having a good deal of history in school. Another that there is really very little history, outside of novels, that is also literature. We tried to read Dickens' Child's History of England when they were quite young, but never finished it, and we expect to add Carlyle's Oliver Cromwell and French Revolution, which are both history and literature, to the list, and perhaps some real history of the French revolution. If you want to make family reading a pleasure, you must read things the family like, else it is mere drudgery. We have been aiming, not to make the children walking encyclopedias, but to give them a taste for the best literature and a love for a quiet evening round the shaded lamp, and in this we have succeeded.

IN THEIR STEPS

"Look here, now, Harold," said a father to his little son, who was naughty, "if you don't say your prayers you won't go to heaven."

"I don't want to go to heaven," sobbed the boy; "I want to go with you and mother."

TO GIVE OR NOT TO GIVE

Written for California Cultivator
By Mrs. G. H. Pettengill, Los Angeles

In the interest of our now overcrowded bric-a-brac spaces, in the interest of our wrapped-up-in-tissue-paper-and-put-away-things that we never use, and in the interest of sane giving in general, please, please listen to the oracle and ruminate well before buying those huge ornate vases for sister's diminutive parlor, those cigars huband never smokes, that gorgeous roll collar for grandmother, that bedecked and beruffled boudoir cap for mother, that traveling toilet case for the mother of two or three babies, those dainty little chocheted bootees for the now walking baby, or that nice warm fascinator for your niece in balmy Southern California. Brother is a fine young fellow, but he doesn't appreciate that beautiful pale pink or sky blue stationery which you gave him last year, and your chum does love you but being such a one as yourself, she must needs wear her stays, so what shall she do with that brocaded ribbon bag?—it's too long to take shopping.

Yes, those were beautiful jabots you fussed up last year, but we all have more than we can wear of them—not that I would have you think for a minute that I seem to appear to presume to look a gift horse in the mouth—but why not give some of these highly acceptable little trinkets?

Big brother, if he be an average brother (and I am "oracleing" only for "averages"), will be pleased with a well chosen necktie, a scarf pin, an umbrella, gloves, books, an appropriate picture for room (those of pretty girls preferred), or if he is a smoker, some adjunct to that avocation. Has he a fountain pen and a watch fob? Then how about a small abridged dictionary? If he scans it carefully he may be able to find something appropriate for you.

And mother! poor, dear mother, if there is anything in the house that needs replenishing, regardless of the fact that we all helped deplete it, every one of us feels urgently called upon to buy it for mother's Christmas present; rugs, rockers, lace curtains, wash tubs, ringers and mop sticks! Give mother something for herself this year, a box of stationery with the envelopes all stamped, a fountain pen all her own, a glove order or two, a box of handkerchiefs or a box of hosiery, an auto veil, a fur neckpiece, a year's subscription to her favorite magazine, a copper plate and a hundred engraved cards, why, she would be fully as well pleased with any of these articles as she would with a boot-jack! Try her and see!

And how about father? Almost anything suitable for brother would please father too, with the possible exception of the picture. And in addition there are doubtless half a dozen magazines which would appeal to his various mental moods, while a morris chair or a foot stool would appeal to the flesh and bone of him, and then an individual reading lamp, and we have father comfortably ensconced for the evening, utterly oblivious of how late Percy stays or at what hour Geraldine arrives home from the party.

And what will sister have? Oh, there are dozens of acceptable gifts for her; guest towls and pillow slips for her "hope chest" (the chest itself, if she hasn't one), books and stationery, the latter monogramed, please, with the die included, a vanity case, the small "Saratoga trunk" kind, a kodak, a silver or ivory toilet article for her bureau, a bureau scarf (be sure to ascertain the color scheme of her room), a silk hat bag for traveling, chocheted lace for her lingerie, tatting bordered handkerchief, beads, silk hosiery—all would please her exceedingly, but rather than all, I am sure she would prefer a soltaire for the third finger of her left hand.

Then, I, the mistress of the house, whether I be aunt, sister, cousin, wife or mother, give me all these things without stint, full measure pressed down and running over, first, aluminum kitchen ware, such as pie plates, percolator, tea kettle, sink strainer, big kettles and little kettles, stew pans, measuring cup, spoons and gem pans, all these and then anything else I may have omitted; a dustless duster in its own little bag for each room in the house, a fireless cooker, a set of salad plates, a dustless mop, soft cushions ready to use, books, stationery (never mind the monogram!) bread and butter knives, glove and hosiery orders, silk waist pattern, a potted fern—with jardiniere attachment—a gold thimble and a couple of pairs of scissors. These, just by way of letting you know my tastes and trusting it may divert your mind from useless bric-a-brac, enough of which I have to dust already, for bear in mind I am not writing for the benefit of the family whose income is only measured by its outgo, but rather do I seek to solve the problem of the great majority—we who are just folks. (Made in U. S. A., too!)

IDEAS FOR THE COOK

Written for the California Cultivator
By Isabel Cottle

Breakfast

Grape Fruit with Maple Syrup
Toasted Triscuits, Cream
Bacon Omelet Whole Wheat Muffins
Raspberry Jam Coffee

Lunch or Supper

Fried Salt Pork with Codfish
Potatoes Boiled in Jackets
Swiss Chard Drawn Butter
Rolls
Fig Pudding, Lemon Sauce
Tea or Milk

Dinner

Roast Beef Fried Apples
Creamed Spaghetti
Potato Salad in Tomato Cases
Cream Sponge Cake Canned Plums
Coffee

Fried Salt Pork with Codfish

Cut fat salt pork in one-fourth inch slices, cut gashes one-third inch apart in slices, nearly to rind. Try out in a hot frying pan until brown and crisp, occasionally turning off fat from pan. Serve around strips of codfish which have been soaked in pan of lukewarm water and allowed to stand on back of range until soft. Serve with drawn butter sauce.

Potato Salad in Tomato Cups

Prepare a good potato salad, boiling four medium sized potatoes in jackets. When cool peel and slice thinly, first cutting through the potatoes lengthwise a couple of times. Add some crisp chopped celery, a little onion if desired and salt to tase. For the dressing mash or force through a sieve the yolks of two hard boiled eggs, season with mustard, salt and white pepper. Mix smooth with vinegar and add one cup sweet or sour cream, with more vinegar if needed. Pour over the potatoes. Remove centers from medium sized, ripe tomatoes and fill with the salad, garnishing top with a sprig of parsley.

Cream Sponge Cake

Yolks four eggs, one cup sugar, three tablespoons cold water, one and one-half tablespoons cornstarch, flour, one and one-fourth teaspoons baking powder, one-fourth teaspoon salt, whites of four eggs, one teaspoon lemon extract. Beat yolks of eggs and water until thick and lemon-colored, add sugar gradually and beat two minutes. Put cornstarch in a cup and fill cup with flour. Mix and sift cornstarch and flour with baking powder and salt, and add to first mixture. When thoroughly mixed add whites of eggs beaten until stiff, and flavoring. Bake 30 minutes in a moderate oven.

Fig Pudding

One-fourth pound suet, one-half pound figs (finely chopped), one large sour apple (cored, pared and chopped), one-fourth pound brown sugar, one-fourth pound bread crumbs, one-fourth cup milk, two eggs, three ounces flour. Cream the suet and add figs, apple and sugar. Pour milk over bread crumbs and add yolks of eggs, well beaten. Combine mixtures, add flour and whites of eggs beaten until stiff. Turn into buttered pudding mould, and steam four hours. Serve with lemon sauce.

Lemon Sauce

One-third cup butter, one cup sugar, yolks of three eggs, one-third cup boiling water, three tablespoons lemon juice, a little grated lemon rind. Cream butter, add sugar gradually, and yolks of eggs, slightly beaten, then add water, and cook over boiling water until mixture thickens. Remove from range, add lemon juice and grated rind.

Mayer Yerma Cushion Shoes quickly relieve tender, sensitive feet. The built-in quilted soles absorb the shock of walking and are restful.

Mayer

HONORBILT SHOES

Yerma Cushion Shoes resist heat and cold—cool in summer, warm in winter. The most satisfactory of all cushion shoes. Up-to-date styles for both men and women.

Citrus Fruit Market

LOS ANGELES, Dec. 9, 1914.

Northern and central California are feeling rather chesty over good words being said of their early shipments of fruit. The growers started in with a determination to be honest with the purchaser and ship only ripe fruit. There has been a little green fruit shipped, but as a rule the grower has stood by the test recommended by the department and good prices are resulting. F. o. b. prices are now running not far from $1.75 to $1.90. One feature which causes a little concern is decay reported from some sections. This is thought to be due to careless handling and must be corrected, for it puts the fruit in the same class with Floridas. Reports from various markets show the Florida fruit to be decaying very badly. Several thousand boxes of Floridas which showed some decay sold in Philadelphia at $1.50. It is probable that 60 per cent of the fruit of northern and central California has been sent.

Lemons are in the same class as olive oil, they are being punished by immense importations from the Mediterranean. Many Californians are now going into storage, though enough are going forward to take care of those who prefer California fruit. Our fruit is selling in New York City markets 60 to 75 cents above imported fruit.

Shipments

Shipments of oranges from Southern California to date since November 1, 446 cars, lemons 361, total 807. To same date, last season, oranges 323, lemons 113, total 436. From Tulare County, this season, oranges 1950, lemons 69, total 2019. To same date, last season, oranges 2110, lemons 11, total 2121. From Butte County, this season, oranges, total 215. To same date, last year, 128.

DECIDUOUS CURED FRUIT SITUATION

SAN FRANCISCO, Dec. 1, 1914.

Although European conditions occasioned by the war are bad, there is a better tone in the dried fruit market; business is fairly steady with operators and everyone is looking for an improvement.

Prunes especially have advanced, probably because we now know about where we stand and what quantity we have and because we find certain sizes are short, which increases the demand for other sizes, and, again, because the French prune crop, which was looked upon as a formidable competitor for the English trade and which was also quoted in this country at low prices, will not leave France, as the French government has forbidden shipment out of the country. So far as prunes are concerned we do not look for any further decline.

Raisins show very little change though some quotations are still being made at prices below those established by the Raisin Association.

Apricots are moving fairly well and values slightly higher, especially in the Choice and Extra Choice grades; Standards are more or less weak on account of the large proportion, and some sections have quite a few Slabs which move very slowly.

Peaches are slightly higher, but the demand which was more active a week or so ago has quieted down. In our opinion, however, peaches will go no lower but should gradually advance. It is not a good thing when there is a coming demand for any variety to check it by too suddenly advancing the price to a higher figure, a steady advance rather than a spasmodic one shows a healthier condition.

The buying trade not having indulged in much speculation so far, but only having bought for immediate needs, should when business commences to steady itself buy more freely, as the low prices which have existed on some varieties of fruit should stimulate consumption.

It appears now as if this season's product might be disposed of before the beginning of another season. The federal banking system which went into operation about November 16 should help matters a great deal, but at first there necessarily will be many things that will not be understood and which time only will adjust. Possibly some do not realize that the federal bank is not a bank where individuals can borrow, but a bank where banks can borrow and recover a portion of the money that they loan to their customers, which enables them to reloan to others. The federal reserve board defines commercial paper on a broad plane but emphasizes three certain things that such paper must possess before it is eligible for rediscount with the regional banks: It must be issued for agricultural, industrial or commercial purposes and not for permanent investment. It must run for not more than 90 days and it must be especially self-liquidating. In other words, it must represent some distinctive stage in the productive or distributive process, such as the movement of goods from producer to consumer. It will undoubtedly stimulate greater credit and do away with many evils and abuses of the past and cause business to be conducted on a sounder basis.

Conditions like those which have existed for the past few months ought to prove conclusively to the growers the necessity of standing together, shoulder to shoulder, and by united effort gaining for themselves the control which others now possess and which once gained will place them in a position to at least have something to say in the management of their own affairs. Their capital, their work, their every effort belongs to themselves and should be employed for their good, instead of enriching those who have no interest other than what they can make out of the producer.—California Cured Fruit Exchange.

LEGAL

(Continued from Page 602.)

trial accident commission of the state of California, at its office in San Francisco or Los Angeles the written application stating the facts of the injury, name and address of the party injured and name and address of employer, statement of the character of the injury and the length of time for which the employe has been working for the employer and salary at time of injury. It would probably be better for you to have an attorney draw up the papers.

Proving Up Homestead

What does the law require a single man to do on a homestead? I have a homestead in Tulare County, which is situated in a very rough place. Can scarcely get a wagon on it and have to haul water a half mile. I have to work for my living and can't make it on said land. Would I be compelled to live there all the time and would it be against the law to cut wood there if I have a timber or rock claim? How long would I have to live on it, what improvements would I have to make and what would it cost per acre to pay it out?—Subscriber, Orange.

You are required to reside upon your homestead for a period of three years in order to obtain a homestead title, except that you may commute this residence by residing upon property for 14 months and paying $1.25 an acre. You may cut wood on land.

(Write to General Land Office, Department of Interior, Washington, D. C., for Circular No. 224, "Suggestions to Homesteaders and Persons Desiring to Make Homestead Entries.")

Accounts Outstanding

Answering an inquiry as to outlawing of open book accounts, Mr. L. B. Stanton recently stated that they outlawed in two years. This called forth a correction by Mr. Scott, of the Scott, Magner, Miller Co., who wrote that he thought this in error, for he had been advised that open accounts did not outlaw for four years. Referring this to Mr. Stanton, he writes:

"The Code which I used, through some error did not have mention of an amendment to the section, and therefore the answer was erroneous. The section under the four year limitation was amended so as to include an action to recover a balance due upon a mutual open current account or upon an open book account, changing the law with respect to open book accounts, which had theretofore come under Section 339, which read 'within two years an action upon a contract obligation or liability not founded upon an instrument of writing executed out of the state.'"

Disposal of Property

A dies, leaving property to be equally divided among three children and a grandson. In case this grandson dies before he becomes of age, who will fall heir to his share? Will his father get it all or will it be equally divided among the three heirs?—Subscriber, Escondido.

It depends somewhat on the will. If the property was given absolutely to the grandson, in case of his death before becoming of age, without will, the estate goes to his father and mother in equal shares, and if either is dead then to the other. If the property be not vested in the grandson prior to majority, it would very probably revert to the estate and be subject to equal division among the heirs.

Abstract of Title

If I borrow money from bank on my ranch and give first mortgage, and the bank bring abstract of title up to date, at the end of three years, when the interest and debt has been paid, is it the bank's duty to bring the abstract of title up to date to the borrower? Also, would like to know, when buying an irrigation right, just how the title should be signed up to be good?—Subscriber, Sacramento.

An abstract of title is a search made of records by private person, firm or company, and there is no law as to who shall pay for it or as to what it should contain. It is never the custom, however, for a lender to pay for bringing an abstract up to date at any time. An abstract of title merely shows the papers which are on record in regard to any property.

Irrigation Right

In buying irrigation right, how should title be signed up?—Subscriber, Sacramento.

As irrigation rights are of such widely different natures, sometimes not even showing upon the records, as in case of riparian rights, it would be impossible to say what would be sufficient.

THE CHRISTMAS THOUGHT

Ideas on Christmas giving are rapidly changing among the sensible. Those who think as they give are looking for a year-round service as the important thing.

In a week of shopping, with all its strain, you will not find a better gift than a year's subscription to The Youth's Companion. It offers its service, its clean entertainment, its fine suggestiveness week after week; and the end of the year, which finds many a gift in the attic, dust-covered and forgotten, brings The Companion again, with all the charm of last Christmastide.

No American monthly at any price offers the same amount of reading, and none can offer better quality. Less than four cents a week provides this best of Christmas gifts—$2.00 a year. If you subscribe now, all the remaining issues of the year will be sent free, and The Companion Home Calendar. A copy of the Calendar is also sent to those who make a gift subscription. Send for sample copies, and the Forecast for 1915. The Youth's Companion, 144 Berkeley Street, Boston, Mass. Subscriptions received at the office of the California Cultivator.

**more power
to the
cubic inch**

To the builders of the first water wheel, the first steam engine, the first electric motor, and the first gas engine, power meant bulk.

Users demanded "more power to the cubic inch of mechanism."

The original inventions were refined, improved, boiled down. The huge water wheel is replaced by the turbine. Watt's crude engine has developed into the steam turbine. The electric motor has been lightened and compressed. The cumbersome gas engine of the old days has become an aeroplane motor—the highest example of a compact, light-weight power-plant.

**THE YUBA
BALL TREAD TRACTOR**

The modern farmer demands that his power producers be less bulky, more powerful, cheaper to operate and maintain.

To meet these demands, we have developed and built The Yuba Ball Tread Tractor. It gives "more power to the cubic inch."

There is a booklet describing it.

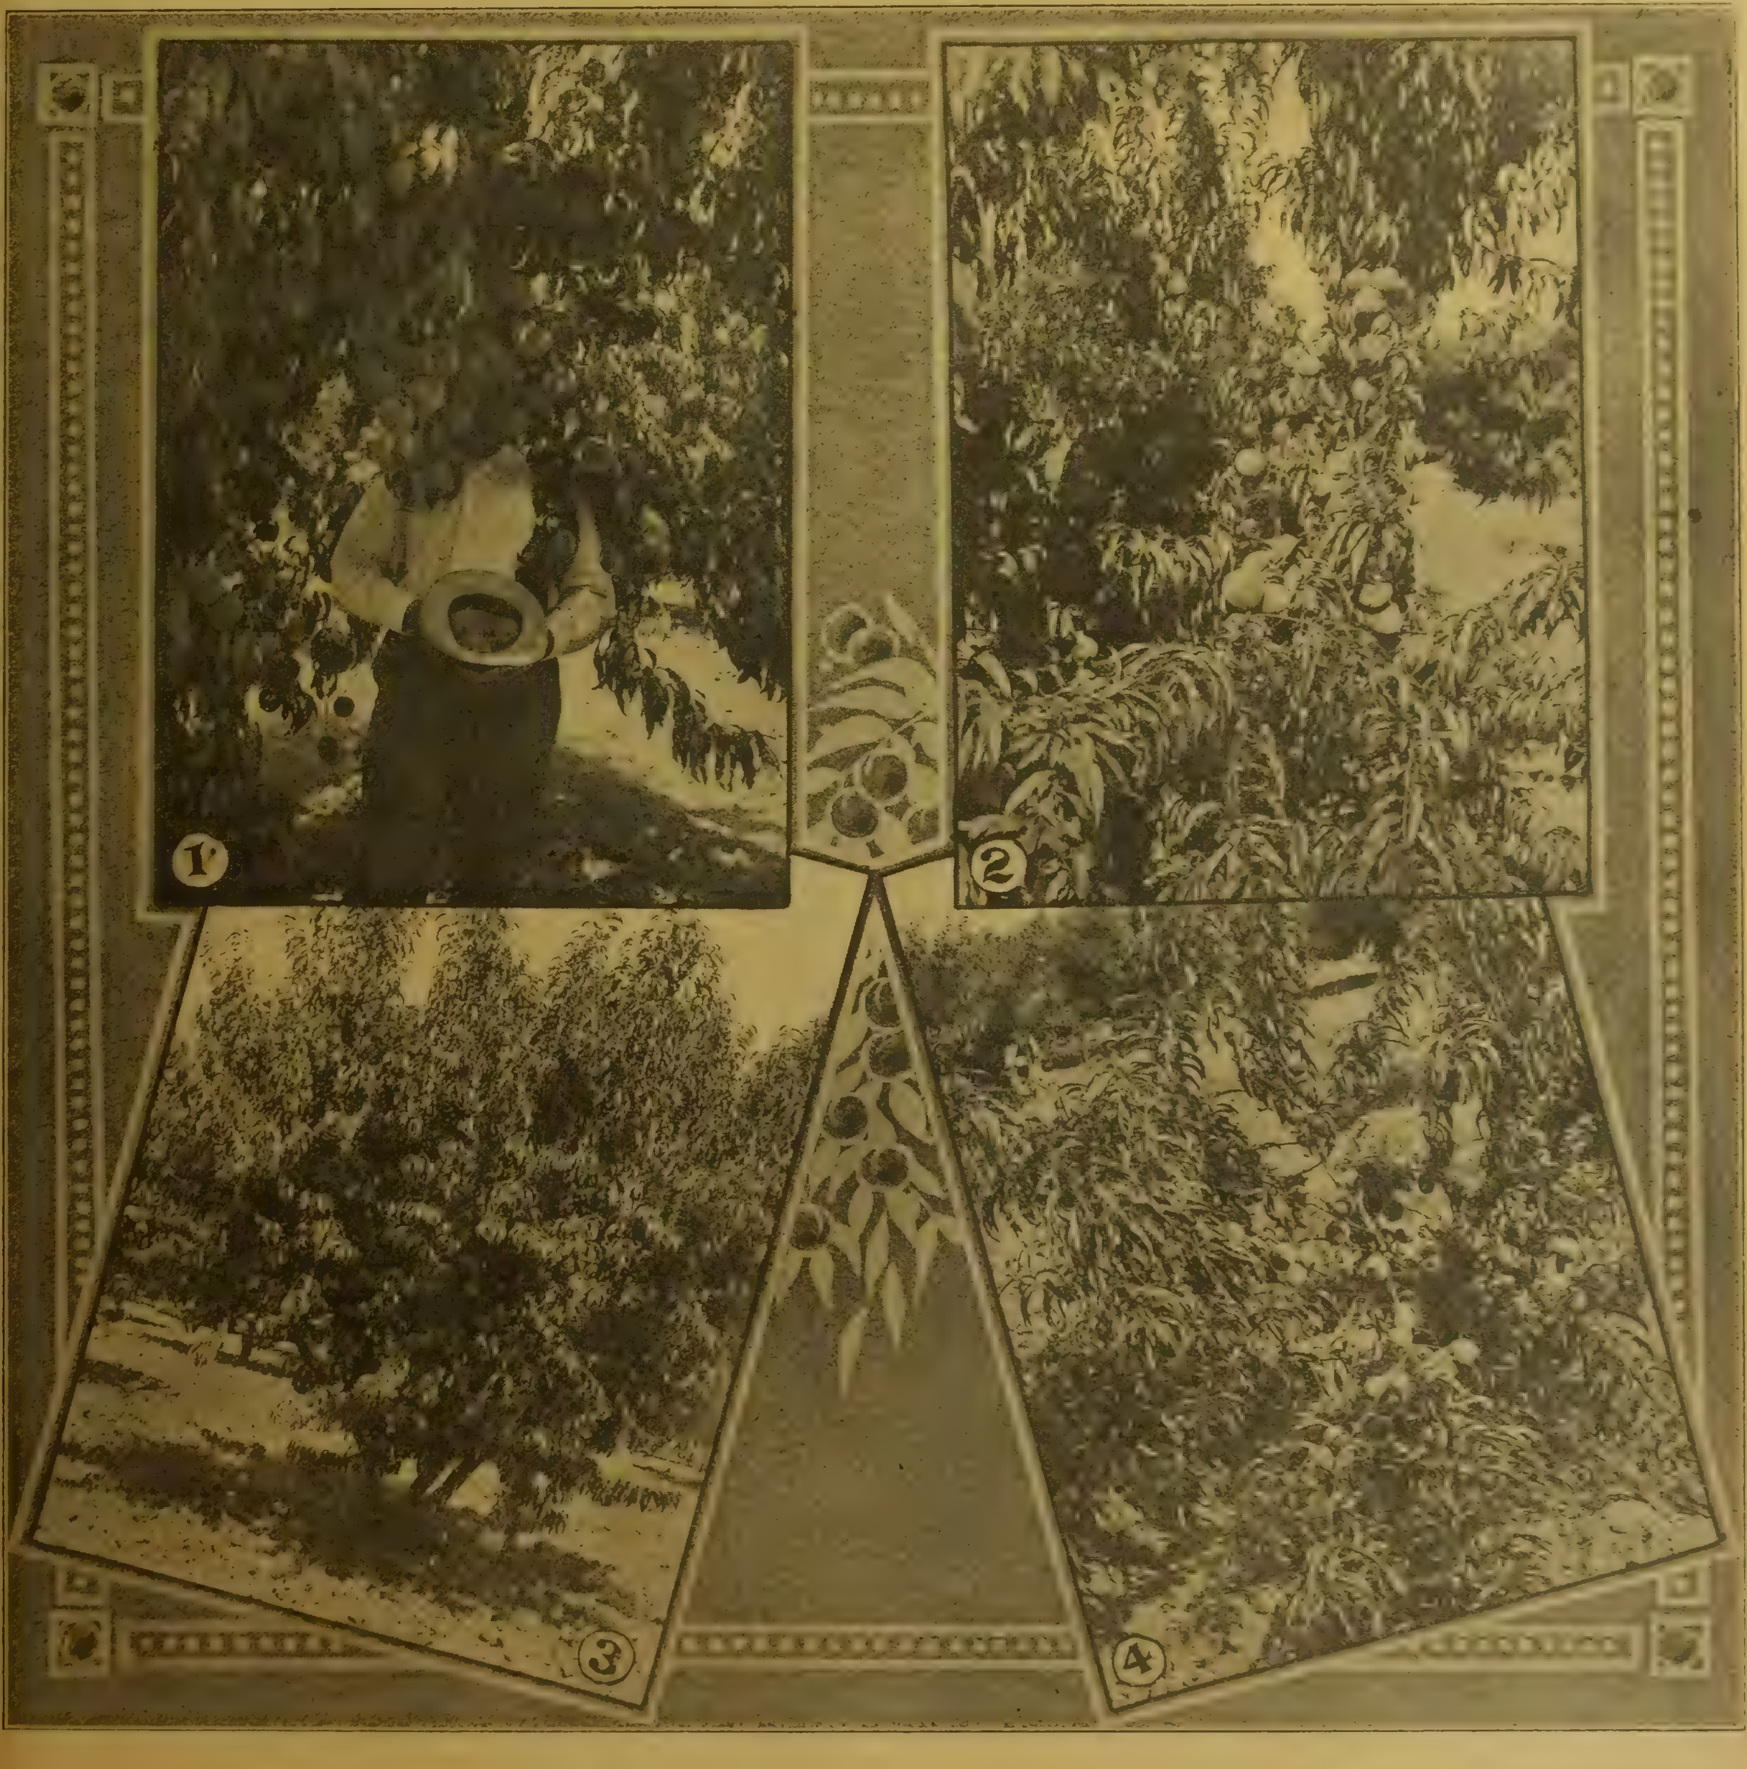
CALIFORNIA CULTIVATOR

Rural Californian combined with California Cultivator

An Illustrated Weekly Magazine, Devoted to the Rural Home and Ranch

LOS ANGELES December 17, 1914 SAN FRANCISCO



Prune and thin your Peaches: 1. Peaches that are worth while. This tree has been thinned and the results are so apparent that no further explanation is necessary. 2. A demonstration of the kind of peaches obtained from a tree which has not been thinned. 3. A six-year-old tree which has been developed by proper methods of pruning. The low compact head with fruiting branches extending from close to the ground to the very top, obtained by a systematic method of pruning. 4. A three-year-old tree loaded with fruit running into the smallest sizes, and with practically all the frame work branches resting on the ground. Failure to prune has stunted this tree; its vitality is gone, and it is not very likely it will ever recover unless cut back very severely and forced to send out a new growth.

This Spring's Chance

in the

Sacramento Valley

Hundreds of prosperous and progressive farmers are already located in the upper part of California's great interior valley.

Have you ever stopped to consider what you could do on a farm of your own? Do you know that successful farm management calls forth the best that there is in a man and makes him utilize his foresight and ingenuity to a much greater extent than other work? Do you realize that the farmer works for himself and does not see some one else reap the benefits he himself has earned?

On the eastern side of the Sacramento Valley lies one of the most fertile tracts in the State. The fine deep loamy soil is waiting to produce the crops to which it is so admirably suited. An unlimited supply of water can be obtained by drilling a well a few feet deep. All that is needed is man's labor and brain to convert this district into one of the garden spots of California. Here one has the long, warm summers, which give ample time for any crop to mature, and the mild rainy winters store moisture in the soil for the following season's growth.

The successful farms already scattered throughout this district are fine examples of what the conjunction of ideal climate and soil, with intelligent labor will do. All sorts of fruits thrive here; banner crops of rice and alfalfa are produced, and the earliest vegetables and garden truck which come to the San Francisco market, are sent from this vicinity. Thousands of miners and lumber men and several large cities afford unlimited markets; two railroads near at hand facilitate disposal of the crops. Farmers' co-operative societies by parcel post and express and sending directly to market are saving more and more of the profits for the growers.

A 40-acre farm, properly planted, is better than any life insurance policy. Not only does it constantly produce an income during your lifetime, but every bit of work put into the place increases by just so much its permanent value.

Why close your eyes? Why not take steps to secure a home and farm of your own now? Why wait until it is too late?

It is our intention to get this district improved immediately. In order that there shall be as little delay as possible to the work we will drill a well on every forty acres and install a complete pumping plant, will furnish modern farm machinery, and supply fruit trees and seed to plant on the land. The land at present is all clean and ready for plowing.

Special Feature

This land is absolutely free from overflow; the titles are clear and guaranteed; there is no bonded indebtedness; there are no irrigation or reclamation assessments. You are buying good land, without incumbrances.

To make this offer still more attractive, we are placing these tracts on the market at a reasonable price—$150.00 per acre, the equipment included. If you want to obtain one of these farms in the early fruit district of the upper Sacramento Valley, write us for further details.

The Peach and How to Grow It

George C. Roeding Writes of the Value of One of the World's Finest Fruits; How It May be Grown and Best Methods of Caring for It

WHAT is the matter with the peach game? Is it overdone or is the present condition due to a series of circumstances which cannot be readily overcome? I am not going to delve into the history of the situation, for if I did I would only be raking over ground which has been thoroughly pulverized by other writers without making any suggestions to bring about a change.

If there is any one thing which rubs me the wrong way in dealing with facts, it is to put on the soft pedal, so to say, beat the air with words and really say nothing worth while. If there was ever a business in which the farmers are engaged in California, needing a good stiff punch right from the shoulder, it is this one game. It is only too true that cling peaches are maintaining a rather uniform price from year to year, with a steady demand.

When four cents a pound is the ruling price for dried peaches, it is useless to deny the fact that the producer is in the hole. Everybody cries "overproduction." The packers start the music going and the echoes travel last to the great consuming public, reverberate and rebound until the poor grower, coming in with the refrain, actually believes he has engaged in a business which is absolutely hopeless.

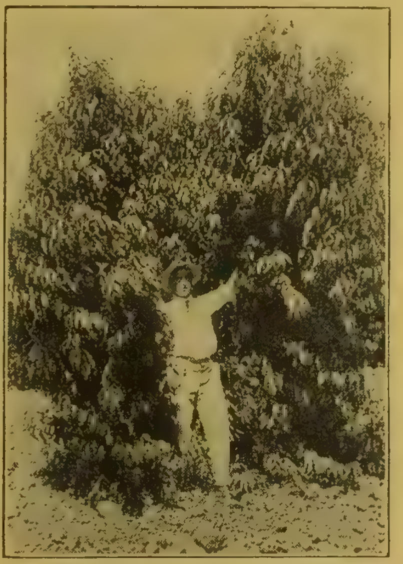
Let me ask you one question right here. Mr. Grower, do you think you are bettering your conditions when this state of affairs exists by going on year after year, putting out an inferior product because you say it doesn't pay to make your fruit better? Right here I want to say that your reasoning is all wrong, for it is just such uninviting stuff which influences the consumer to say: "Nay, nay, Pauline! this article does not appeal to me."

If the man who consumes your stuff refuses to buy because its appearance is against it, what prospect is there for better returns? He is the man you have to reach. How are you going to do it? By offering an article of food which is not pleasing to the eye? Correct this one fault and you will be surprised to see how quickly the situation will change.

Are you going to raise the level of your product by offering the same old artfcle year after year or are you going to be the first one to deliver the punch, and how are you going to go about it?

Peeled Peaches

When a man is engaged in a commercial business, if he is going to stick he realizes that he must induce the fellow who has the money to buy to head his way. After he has a taste of the stuff he has to sell he employs every legitmate means at his command to cause him to call for more. There is nothing wrong with the peach business except that the word "more" has been forgotten. Dried prunes and apricots are immense factors in the California fruit trade, why should peaches lag? What is wrong? The answer is "Nothing, except that fuzzy skin." It is just that one thing that curtailed our trade with Europe. The greater part of our prunes and apricots are exported, and this same market and our own should take our peaches if you remove the fuzz.



5. This young tree was planted in March, 1912, and demonstrates the remarkable growth obtained by severely cutting back. This tree was cut back to the point where the branches commence to fork, which you will notice is on a line with the man's belt.

You believe it, and so do I, that when this market was being vigorously developed three years ago, and dried peaches reached the very remunerative prices of nine and ten cents per pound, Europe was buying freely of our stuff.

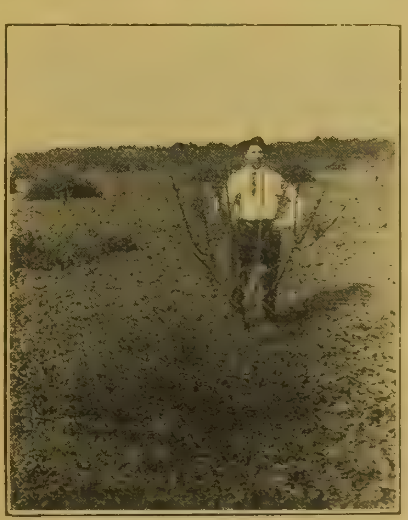
What stopped it? Not hard times, but simply that fuzz, to which our European friends made such serious objection that exports became very small. How many people would eat canned peaches with the hide on? Then what is the use expecting them to take them when there is no mitigating sweet syrup to neutralize this skin when the peaches are dried? In my opinion peeling of peaches will solve the problem of marketing. It is easily done. Even a small grower can do this work to good advantage.

All that is really necessary in the way of appliances is an ordinary prune dipper, in which one pound of lye is dissolved in 15 gallons of water. The lye water should be maintained at boiling point and the peaches, after being halved, placed in this solution for about one minute. The fruit should then be dumped into a tank of cold, clear water, which should be changed occasionally, when the skins will immediately slough off. The sulphuring of the fruit should be carried on in the usual manner employed for peaches not so processed, but should not exceed four hours. The sulphur bath is of sufficient duration when the syrup collects in the cup of the fruit. One important point which should not be overlooked in order to have a first-class dried article is to have the trays clean.

Experiments made with peaches treated in the manner described have demonstrated that the loss in weight is not as heavy as might be inferred. In an experiment made with Lovell peaches, in which the fruit was carefully weighed, the unpeeled peaches dried away from 100 pounds to 24, and the peeled to 16. In each instance the weight of the pits was eight pounds.

The first question the practical grower puts is, "What is there in it?" Well, to begin with, you are producing a palatable article of food, so much so that a peeled peach is just as good as a first-class canned peach. Even in this year of low prices for dried peaches, a few growers who have been engaged in peeling peaches in a small way have had no difficulty in selling their product at from 10 cents to 12½ cents per pound.

There are peach peeling machines on the market which are used by all the canneries and which it would be a decided advantage for the large growers to use. These machines will deliver the peaches on the trays without any handling except that the fruit has to be placed with the cups up.



6. The same tree properly pruned in December, 1914. Notice the branches, the wide open goblet shape and the general sturdiness of the tree. A tree pruned in this manner will not only make a fine growth, is full of fruit spurs and will support a heavy crop of peaches without being twisted out of stape like a tree allowed to send its branches upwards without any effort to check same and develop elbows as illustrated in the picture.

Pruning

It is the beginning of the end. "Why?" you ask. Simply this; it is the one particular phase of your education you are going to fight shy of. It is only natural that a beginner in the fruit business should want returns as quickly as possible from his undertaking.

What does he do? Leaves plenty of wood on his young trees. He usually has enough solicitous neighbors around who, if he does prune heavily, tell him he is ruining his orchard and might as well dig it up. What is the result? The accompanying pictures tell their own story.

I am rather forcibly reminded of the effect pruning severely makes on the average person's mind by an experience in which I figured as the leading man in pruning a few trees as samples in a two-year-old peach orchard which had been planted by a friend of mine at Gridley ten years ago. I was attending a fruit growers' convention at Marysville. It was early in December and, as a special favor, I was requested to visit the orchard and give the foreman a few ideas about pruning. It was then two years old. It had been pruned severely the first year and the trees had made a fine growth.

I had just finished pruning a few trees. cutting them back severely. when the foreman, who, by the way, was of Teutonic origin, drew the owner aside and in a voice which he evidently had tried to suppress into a whisper, but in his excitement utterly failed. remarked, with tears streaming down his face, "Mein Gott! Mein Gott! dat man vill kill our beautiful trees." My friend was obstinate, insisted that my instructions be followed. I had the satisfaction of learning from him, while discussing and laughing over the incident a year ago, that the orchard had not only made a most magnificent growth, but in addition to this had been a heavy and regular bearer of the very best fruit. There is no use quibbling about it, for it is an actual fact that lack of proper pruning primarily is the cause of much of the inferior fruit, both fresh and dried. which is offered for sale. Prune your peach trees every year and very severely for the first years anyway, to develop a strong, stocky tree with an abundane of laterals and a broad bearing surfae.

Don't prune for a lot of bean poles, with a few fruit spurs in the top of the tree; then complain that your orchard never pays. Just bear this one point in mind, that such pruning as we have to do in California calls for the exercise of good common sense.

In the nurseries of Europe yearling trees are very rarely sold. They are known as maidens until their training commences, and this sometimes extends over a period of from three to eight years before the trees are sold.

Roeding's Service Guarantees Successful Results

PLANTING THE TREE
HARVESTING THE CROP·

FROM the planting of the tree to the harvesting of the crop is sometimes a long period, and you want to feel sure in the start that your trees will turn out to be what you expect—that they will produce extra fancy fruit, the kind that is always in demand and brings the highest price.

Of course the feeling of certainty rests most securely on him who plants GOOD trees—not "bargain lots." But in addition it is worth while to have someone, upon whose judgment you can absolutely rely, advise with you from time to time about the proper care of your orchard to bring the trees into bearing.

HERE'S WHERE R & W SERVICE STEPS IN

Thousands of growers know Geo. C. Roeding and are grateful for his counsel and advice. You, too, can have it. More than 30 years of experience in growing, packing and marketing citrus and deciduous fruits are at your disposal FREE when you buy trees from us. We want to see every tree that we send out prove its worth and make money for the grower. Our success depends upon the success of those with whom we do business, and we have therefore established a service department to help our customers. Write us for more information.

CITRUS Trees

We have a magnificent stock for this season's planting, comprising all the leading varieties of

ORANGES, LEMONS, POMELOS, AVOCADOS, LIMES, ETC.

We also have a splendid stock of

OLIVES

in all the leading varieties, as well as a complete line of

DECIDUOUS FRUIT TREES

—apples, pears, plums, peaches, prunes, grapes, etc., as well as ornamental and evergreen trees of every kind and description.
Our stock is guaranteed true to name and is grown under ideal soil and climatic conditions.

Citrus and Tropical Fruits

THE AVOCADO SITUATION

By F. O. Popenoe Before State Nurserymen at San Diego

IN the beginning I shall assume that the avocado has come to stay. It is not supposable that a delicious fruit of the highest food value, which is found to flourish over a wide range of territory in this state, will be other than increasingly and extensively planted.

In Southern California from Santa Barbara southward fruiting avocado trees ranging in age from three to 30 years are to be found in quite large numbers. These afford a practical and acceptable demonstration of the adaptability of the tree to this climate and soil and of its fruitful character. It is not now a question as to whether we shall plant the avocado; it is only a question as to how rapidly the planting of good varieties may be proceeded with. This fact alone will determine the future development of the industry.

Propagation

Under this head as a first item may be mentioned the seed supply. By a ruling of the federal horticultural board it is now impossible to import seeds from Mexico where they have heretofore been obtained in large numbers. Neither can they be brought from the Hawaiian Islands. Importations may be made, I believe, from Florida or Cuba. Young trees grown from these seeds are too tender to satisfactorily work in this climate. Therefore the future development of the industry wil be dependent upon the seeds grown at home. Fortunately a fairly large number of Mexican seedling trees are coming into bearing in Southern California. These seedlings are sometimes wonderfully prolific. An eight-year-old tree at Azusa last year produced 5000 fruits, so I am informed by its owner, John Ott. This, I believe, breaks the record. But many such seedling trees are known to have grown 2000 or more fruits yearly. Thus, by another year or two, when a still greater number of such seedling trees are in bearing, the seed supply will be provided.

Attracted by the apparently high price at which budded avocado trees are selling, many people have been drawn into the attempt to propagate them. Not only have the nurserymen undertaken this, but as in years past when seedling orange trees were planted in hundreds of back yards, so also in the case of the avocado, many a man or woman with a taste for growing things and a desire to increase the yearly income has attempted the budding process. Almost without exception these undertakings have ended disastrously. Not only amateur, but experienced nurserymen, have found the budding of this tree difficult, and the number of failures may be compared to the number of failures in gold mining. In our own work at the West India Gardens where we have budded thousands we feel that while we have learned some things we are yet on the threshold and have still a large number of things to learn.

THE NORTHRUP AVOCADO, TYPICAL OF THE THIN SKINNED MEXICAN, HARDIEST VARIETIES

The two vital points are the condition of the seedling stock and the suitability of the bud. The time of the year matters little and is provided for in the statement "conditon of the seedling stock." The sap must be flowing freely. The bud varies greatly with the different varieties so that it is impossible to lay down a rule. The right bud to use can be learned only from experience. In some varieties it may even be said hat the buds are never first-class. In such cases failures are always numerous. Unfortunately this applies to some of the varieties most worthy of propagation.

After the bud forms a union with the stock, the treatment is a simple one—merely keeping it in vigorous growth by topping back and suckering the seedling stock. Cutting off the old stub at the wrong season of the year is the cause of some loss. This should be done preferably in winter when but little sap is flowing, otherwise one is likely to induce a "dieback" which is not easily checked and often goes below the bud.

Field grown trees are by far the most desirable, budding into pots, boxes and cans can be done and is the method largely followed in Florida, but is only partly successful in California, perhaps on account of our drier climate.

Loss has been sustained in the past by planting young and tender trees in midsummer. The ideal planting season, I believe, is the month of March.

A TYPICAL SPECIMEN OF THE LARGE FRUITED, THICK SKINNED COMMERCIAL AVOCADO

The avocado likes cool weather and its root growth begins early. Thus by early planting a tree wil become established and have an opportunity to harden its wood before the heat of summer.

Young trees planted in orchard form should be preferably 30 by 30 feet or 50 to the acre. They grow considerably larger than budded orange trees. For the first year or two double the number of irrigations given an orange or lemon orchard will be well repaid by the vigorous growth of the trees. Needless to say thorough cultivation must be maintained.

Varieties

All avocados are good. I have seen many thousands of them and have never found one that I could not enjoy eating. Like all good things, however, some are better than others and fortunately we have growing and fruiting in Southern California some so good as seemingly to leave nothing further to be desired. Yet to say that any one of these will be the ultimate standard for California growers is to make a statement that may need future modification.

The varieties may be sharply divided into two classes, the thin skinned and the thick skinned fruits. Of the former it may be said that they, as a class, are the most prolific and best flavored. Reference has already been made to the tree of John Ott that produced 5000 such fruits last year. These fruits weighed perhaps four ounces each and were good eating. Here we have 1200 pounds of food containing a high percentage of oil. This would give one person a pound for every meal during the year if the fruit would keep so long—which it will not of course, but the statement illustrates the point.

An analysis made by the University of California of the Chappelow variety, another of the thin skinned type, furnishes the astounding fact that the total edible portion (that is, the entire fruit exclusive of the skin and seed) contains 29 per cent fat. Here is a subject for the consideration of food specialists. The Chappelow this season is bearing a crop of two or three thousand such fruits, each one weighing from five to seven ounces.

The Panama Canal and The California Fruit Grower.

P-A-N-A-M-A C-A-N-A-L spells, to most people, merely Panama Canal, but to the California Fruit Grower it spells OPPORTUNITY, for fruit can now be shipped, via the Canal, to the Atlantic Seaboard, at

A Saving of 60% or More

over the present freight rates. This means Business Expansion—new markets—greater demand—larger sales—and MORE PROFITS—for those growers who are *prepared.*

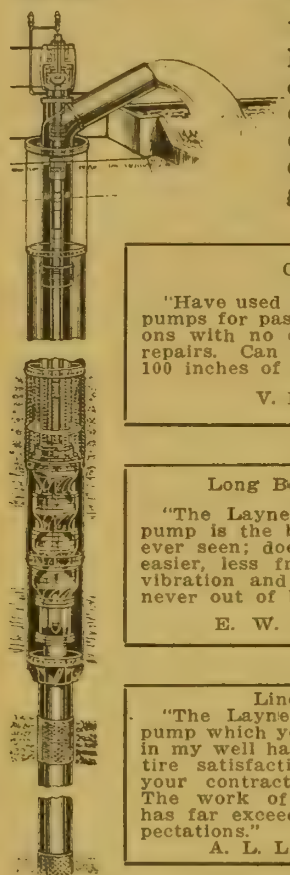
What a Few Owners Say
ABOUT THE
LAYNE & BOWLER PUMP



We give below several extracts from letters received from users of the Layne & Bowler Pump. We have hundreds of such letters on file. Send today for our Catalog No. 30. It tells how you can produce the cheapest water and gives valuable irrigation data.

Chino, Cal.
"Have used one of your pumps for past two seasons with no expense for repairs. Can easily pump 100 inches of water."
V. E. WIRE.

Elsinore, Cal.
"My Layne & Bowler pump has run through the season and has done perfect work. I do not hesitate to tell everyone it is the best pump on the market."
F. C. LILLIE.

Long Beach, Cal.
"The Layne & Bowler pump is the best I have ever seen; does its work easier, less friction, less vibration and noise, and never out of balance."
E. W. SPEARS.

Los Angeles, Cal.
"With the Layne & Bowler pump we are pumping about 40 inches more than we expected to get. I consider it the best pump for irrigation."
PERCY H. CLARK.

Lindsay, Cal.
"The Layne & Bowler pump which you installed in my well has given entire satisfaction as per your contract with me. The work of the pump has far exceeded my expectations."
A. L. LAIDLAW.

Van Nuys, Cal.
"I have always been a booster for your pump and it has given me all the water the well will supply at a depth of 118 feet. What more can a pump do?"
S. O. HOUGHTON, JR.

Thus the thin skinned varieties may be said to be ideal for home use and fortunate indeed is he who may have one or more of them growing in his yard.

But it is to the larger fruiting and thick skinned varieties that we must look for our commercial avocados. Giving all due credit to the thin skinned varieties, I believe it is reasonable to say that as compared with the larger, thick skinned fruits they are not to be considered from the standpoint of the commercial grower. While these latter fruits fall a few points short in oil content, their other qualities more than overbalance this for the grower who is going to sell his product. While there is no valid reason for it, nevertheless it is a well understood fact that it is a characteristic of human nature to select the larger of any two things. This may be because we are all selfish. The higher price will always go to the large fruits and it will not only be a higher price, but it will be a price higher in proportion to weight—one large fruit perhaps selling for the price of four small ones even though the four small ones may weigh twice as much as the one large one. The thick hard skin of the Guatemalan types permits of successful transportation to any distance, so far as our own country is concerned. Besides this the larger fruits peel, slice and serve more attractively. This in brief is a comparison which I have tried honestly and conservatively to make.

Now as to individual varieties. We have heretofore ranked the Taft, grown by C. P. Taft of Orange, as the leader. It is a fruit of good form, fine appearance, ideal weight (about one pound) and of very satisfactory quality and flavor. The remarkable feature is that the fruits remain a long time on the tree in good condition. Mr. Taft has picked marketable fruits in April and has allowed others to hang on the tree until the folowing October. I know of no other variety which will carry its fruit for such a long time. The Taft has not yet produced fruits in sufficient quantity to enable us to say that it is up to the mark in productiveness. Mr. Taft, who is a conservative and conscientious man, believes, however, and in this I agree with him, that the immense amount of budwood cut from the tree to supply the demands of those propagating it is a reasonable explanation for this apparent deficiency.

Blakeman.—This is an eight-year-old tree growing at Hollywood and is in its second year of bearing. Last year its production was approximately 50 fruits; this year from 150 to 200 are hanging on the tree, making a most beautiful sight. In form and appearance, the Dickey fruit may be ranked as de luxe. As to flavor and quality the words de luxe are hardly enough. As the Englishman would say, it "wants beating." In the matter of propagation it may be said the young tree grows vigorously and handles well. The fruit matures in the spring and is green in color.

The Lyon.—This variety has the very desirable quality of ripening its fruits early, a thing much to be desired. Its season may be classed as February and March. It is of good size, form and quality, prolific in bearing and worthy of extensive propagation.

Challenge.—As the situation stands today we must all take off our hats to the Challenge. This tree is owned by J. H. Walker of Hollywood. It is perhaps 17 years old and has been fruiting for possibly ten years, with a gradually increasing yield which has reached this year the high water mark, —approximately 2500 fruits which will begin to ripen in February and will at that time average one pound in weight. The owner is just now spending $125 for a system of supports to prevent the crop from breaking down the tree. The value of this crop to Mr. Walker will be approximately $800. After it has passed through the hands of the retailer this sum will have increased to at least $1200. The prospective planter who desires to compute his future income from 640 acres can now get to work. If, however, he will begin by throwing off 15-16 of Mr. Walker's income from the Challenge this year and estimate $50 per tree and 50 trees to the acre, he will have a return that should be satisfactory to him and one that I honestly believe he can realize.

So much for some of the thick skinned, large fruiting commercial varieties. Space forbids the mention of the Sharpless and others. As for the thin skinned, small fruiting kinds, the Chappelow, Carton, Harman, Ganter, Blake and Northrop will afford a range in form and size that will satisfy every fancy.

Orchard Planting

While details of commercial plantations are somewhat dry, I desire to place on record the following data as serving to establish the growth of the industry. In passing it may be remarked that orchard plantings would have been at this time greater in extent had it been possible for the rancher to have procured a larger stock of budded trees. So far the supply of good budded trees has been unequal to the demand, and my own opinion is that this condition will prevail for several years.

It is also known that extensive increases are being planned by nearly all of the above growers and that contracts have been placed for next spring's delivery for trees to provide for new plantations of from five to forty acres in various localities.

SYRUP FROM APPLE CIDER

Recently the office of information, United States department of agriculture, released a paper on "Discover Way to Make Fine Table Syrup From Apples." The patent applied for is in the interest of the public and is believed to be of value in utilizing undesirable or unmarketeable apples.

The paper containing the information shows that the syrup is made from apple cider and that one gallon of sirup is obtained from every seven gallons of cider. In some respects the syrup is similar to cider syrup that was known to us 20 years ago. In other respects this syrup is similar to cider butter.

Inasmuch as the new process was designed chiefly for the cider mill or other manufacturer who desires to manufacture and sell cider syrup, the question immediately arose as to whether or not such a process would be feasible. From the home manufacturer's point of view the introduction of milk of lime (slaked lime suspended in water) did not appear practicable because it would be difficult to teach the average person the right amount of milk of lime to use. As outlined there is another objection in that the addition of water contained in the milk of lime dilutes the cider and consequently increases the time for the concentration of the cider to the proper consistency.

Taking these objectionable features into consideration, Professor Geo. Olson of the state experiment station at Pullman, Washington, has modified the original process in such a manner as he believes will make it of practicable use to not only the cider mill but also to the housewife. Whatever changes have been made in the process it is hoped that it will not modify the patent in any way whatsoever. With this understanding, any one who desires to make sirup according to the modified method does so without infringing upon anyone's personal rights.

The modified process as worked out at the Washington state experiment station chemical laboratories (lime carbonate) is used in place of milk of lime and an untreated boiled apple cider is used to render the chalk treated cider slightly acid.

The ample addition of milk of lime or precipitated chalk changes the coloring matter in apple cider to an inky color. Lime also tends to impart a chalky flavor. Its chief use, however, is to neutralize the malic acid in the cider and form what is known as calcium malate.

The difference in the use of milk of lime compared with precipitated chalk is in its limits of reaction. The milk of lime must be cautiously added so as to avoid an alkaline reaction, otherwise more cider will have to be added until the color of the liquid returns to an amber one. This moving from the alkaline to the slightly acid is not easily accomplished and in the hands of the average person may make a product varying more or less in flavor. On the other hand, precipitated chalk will react with the acid in the cider to form a neutral product (neither acid nor alkaline) and which is easily made slightly acid according to the following instructions:

For every 100 pounds of cider add one-half pound (ample in most cases) of precipitated chalk or enough more to make the treated cider take on a bluish to blackish color. Boil the cider for five to ten minutes and filter while hot. Collect the filtered material into open kettles or pans, add five pounds of boiled and filtered apple cider that has not been treated with lime carbonate. Boil again until the cider has reduced to one-seventh its original volume, then filter under pressure. The sirup formed is "distinctive" in flavor and appearance.

Peaches $10,000 Worth — 400 Tons from 900 Trees in Six Years from Planting

Read This Letter from C. H. Schmidt of Selma, Cal.:

Selma, Cal., Nov. 14, 1914.

Mr. Geo. C. Roeding, Pres. and Mgr. Fancher Creek Nurseries, Fresno, Cal.

Dear Sir:—

I think you will be interested in a brief outline of what I have accomplished with the peach trees which I purchased of you in 1908.

In the first place, the trees that you supplied me with were just the kind of nursery stock that I know Roeding invariably supplies to his customers. I am only one of the many boosters you have through the West who can point with prideto Fancher Creek Nursery grown trees which have created a standard of their own through the exceptional care and thought you have given to the perfecting of all your stock.

The very fact that I had the right kind of a start and in connection with this, that I gave proper attention to the matter of pruning, cultivating and fertilizing has, in a measure, contributed to the very satisfactory results which I have succeeded in obtaining. You have visited my orchard from time to time, but I do not believe you have ever fully realized the success I have met with.

My orchard is now six years old and up to and including 1914, I have delivered from the 900 trees, 400 tons of peaches and have received for the same the tidy sum of $10,000. If I do say it myself, I think there are very few orchardists who can make a more favorable report than this.

Only recently I measured a few of these trees and I was very much surprised to find that they average from two to three feet in circumference a foot above the ground, while neighboring orchards, planted on the same character of soil, ten years of age and older, would not average over one foot in circumference.

I think I have demonstrated very fully that any fruit grower who will secure quality trees to begin with, such as you always furnish, and will put the proper thought into the care of them, will meet with the same result that I have obtained. I want to take this opportunity of thanking you for the advice that you have given me from time to time, and I want to say further that it is this kind of service which does not end after the sale of an article that is appreciated.

Yours truly,
(Signed) C. H. SCHMIDT.

Roeding's

True Trees Yield Profitable Crops

FOR over 30 years we have been growing nursery stock in California. Our nurseries are located in the most desirable spots, under ideal soil and climatic conditions. We grow everything that grows—fruit and ornamental trees, vines, shrubs, plants, etc.

Write Us for Prices

Get in touch with us at once as to your probable requirements for this season's planting. Send us your list for prices and suggestions. We will be glad to advise with you free of charge.

Incorporated 1913

Citrus Trees Exclusively

All Leading Varieties

REMEMBER, MR. PLANTER

Practically anybody can grow a citrus tree, but it takes years of experience to produce a tree that will prove a money-maker when it comes into bearing. Nice-appearing nursery trees are desirable and promising, but do not always prove to be good bearing trees in the long run. Plant for profit and not for appearance only. Our trees are straight, thrifty, well rooted and have strong, full heads, but the main consideration is that: Our buds are carefully selected from heavy fruiting trees and will prove true-to-name revenue producers.

OUR TWENTY-FOUR YEARS

of experience in the growing and handling of citrus nursery trees gives the buyer the advantage of starting out RIGHT, thus avoiding disappointment at the end of four or five years' labor in bringing the young orchard into bearing.

ANOTHER POINT TO CONSIDER

Growing a good tree is only part of having it do well after planting. Many a good tree is ruined in the taking up from the nursery and shipping. We give the best of service in the proper handling and delivering of our trees.

WRITE,

'phone or call on us before **buying your trees.** Tell us your wants and we shall be glad to give you the benefit of our wide experience as to planting, soil conditions, fertilizers, etc.

Our illustrated new booklet on citrus culture mailed to any address upon receipt of 25 cents.

General Agriculture

HOW TO MAKE THE SUGAR BEET A PAYING CROP

Written for California Cultivator
By Percy L. Edwards

To get the best results from the sugar beet crop it is essential that lands to be used for the crop shall be properly fertilized and there be some system of rotation with other crops. All of us understand the importance of humus in the soil. In a general way we know what humus is. It may suffice to say that humus is a vitalizing element and is necessary to thrifty plant life. In this way the necessity of furnishing this element to the soil is easily understood. Sugar beets are heavy feeders and the soils in which they do best must necessarily contain plenty of plant food. Fertilizing the soil is, therefore, a subject of great importance to beet growers.

Common Fertilizers Best

The common fertilizer more in use than any other, and which is at the same time the best of all, is barnyard manure. Next consider green crops plowed under long enough in advance of seeding to permit of decay and taking the form of humus in the soil. Chemical fertilizers are to be used not so much for their plant food value as for a tonic. Chemical fertilizers are valuable, there is no doubt, used for this purpose. It may be that some of the so-called chemical fertilizers now manufactured go farther and furnish some plant food, but the high price of such fertilizers will restrict their use in the best lands. The writer has used chemical fertilizer to good advantage in getting an early start and a good stand. After that the beets had to depend on the plant food stored in the soil. This experiment was made on sandy soil with a heavy, moist, underlying soil several feet beneath the surface soil. The result was fairly good. It was a second crop of sugar beets on same land. In the long run it may now be said that no kind of soil improver can be used to the exclusion of others if we hope to increase the fertility of our soils to the fullest extent and to reap the greatest profit from our labor. Stable manure is indispensable, but there are few farms on which enough manure is produced to maintain soil in the best physical condition and to replace the elements removed by the former crop. For this reason, partly, every rotation system, and there should be a rotation system about all farming operations, should include one crop to be plowed under, commonly called a cover crop. Whether the primary object of this crop be to increase the vegetable matter in the soil or, in addition to this, to increase the nitrogen content of the soil, will depend upon the particular conditions of the lands, and selections of this crop should be governed by these conditions.

If vegetable matter for the soil is the main consideration, then such green crops as grain, vetch, etc., in fact any vegetable matter that will easily decompose, may be plowed under for this purpose. But where more nitrogen is needed some leguminous crop such as alfalfa, clover, peas and the like should be used. The writer is aware that alfalfa will not be plowed under so long as the hay crop is profitable; also that the cost of the seed for cow-peas and, in fact, most of these nitrogen producing crops, is a bar to their use except in a restricted field. But if the result justifies the expense of using an expensive cover crop before a crop of sugar beets, that fact must govern in determining what course to follow. Vegetable matter in the soil is so essential to its productiveness, and the soil is so liable to lack in this essential that a constant application of some form of manure can not be too strongly emphasized. Briefly stated, the presence of vegetable matter in the soil puts plant vitality into the soil. A soil deficient in vegetable matter is said to be dead. This is literally true. In such soil it is utterly useless to sow seeds of any sort. The aim must be to supply the soil with sufficient plant food in the shape of decomposed vegetable matter, air, and moisture. With these elements in any reasonable proportion there is no surer result in any venture than in farming the soil.

The elements of phosphoric acid and potash in the soil are not increased by the use of green manures or by crop rotations. But whatever of these two elements are present in the soil they are made available by such means as we have called attention to. Whatever of potash and phosphoric acid are lacking in the soil may be made up in the use of commercial fertilizers. These commercial fertilizers should be used intelligently. In order that such fertilizers be used to best advantage soil analysis should precede their application. It is obvious that the ordinary farmer is not equipped with the means of determining just what his soil needs in the form of commercial fertilizer. The government at Washington and the state institutions are showing an interest in this matter of soil analysis and together with agricultural publications are undertaking to give this information to farmers. It is of more than ordinary interest to growers of sugar beets.

Advisable Crop Rotation

Every good farmer realizes that the best results are obtained with all crops when some well planned crop rotation is practiced. Now and then we hear of a successful one-crop farmer, but he has always been the exception. In the same class is the farmer who raises several crops but continues the same crop on the same land for several years. Both these methods are antiquated. They have been attended with a great deal of risk on account of the propagation of pests of many kinds. The soil may be rich enough in vegetable matter to stand the strain, but the continuous cropping to one plant seems to induce a condition favorable to insects, fungi and the like. Each particular pest flourishes best on some particular crop. The scab which affects white potatoes, a fungous disease, is propagated in this way Sugar beets following potatoes have been affected by this disease.

It is important that the rotation of crops be systematic. No rule can be laid down for the farmer to follow in this case. The individual farm must have a system adapted to its requirements. There are some principles of a general nature which should be borne in mind in planning a rotation system in sugar beet growing. For instance, the crop preceding the beets should be of such a nature that it may be out of the way in time for preparation of the land for the beets. Fall plowing is the thing for a beet crop. In California some beet seeding is done in December, but by far the greater acreage is seeded in February and March. If the land is plowed in November, or earlier if fit, this will give several months for the plowed land to be exposed to the natural elements. Crops preceding and following beets should be of such a character that they will not serve as food for the same pests that attack sugar beets. For example, land used the year previously for Indian corn would, as a rule, be admirable for the sugar beet crop following. Potato land, where the soil has not been too frequently used for the potato crop, is excellent land to rotate to sugar beets. Grain lands, especially wheat lands, are more generally used than any other land for beet crops, at least in California. If bean lands are used the better practice is to follow the bean crop with beets. If then a nitrogen producing crop is seeded on this land it will be kept in the best condition for another succession of the same crops.

Where sod land is plowed under for sugar beets it should not be used until such a time as the sod has become rotted and entered into the soil composition. In this case also there will be extra work required to get rid of the weeds and grass which usually are present in the sod turned under. Time should be given for this growth to show up and then care used in chopping up the growth thoroughly with disk and harrow so as to rid the ground as much as possible of weeds before seeding. But this is a problem which does not trouble California farmers so much as in other parts of the country. Our sod lands are limited. As a rule it may be said sod lands should not be used for beet seeding the same season they are plowed.

As sugar beets rotate with the grain crop, so will the grain crop profitably follow the beet crop. Without any exception, so far as the writer has had experience, when the grain crop follows sugar beets, the yield in grain has been materially increased. In some cases this percentage of increase has amounted to quite 50 per cent of the original yield. Oats, especially, do well following the beet crop.

On some of the heavier and richer lands, where deep plowing has been resorted to, a second crop of beets may follow the first crop. In this case it is well to plow under all the beet tops left from the previous crop. As a rule, stock is turned into the beet field as soon as the harvest is over, for the purpose of feeding them on the beet tops which make such a valuable fattening food that stockmen are willing to pay from $2.50 to $5.00 per acre. The land receives a benefit in any way you look at this. But a better plan is to plow under the tops and restore, in part, what has been taken from the soil. This second crop sometimes will show a yield in beet tonnage in excess of the first crop, if the conditions are the same. A third crop should never be attempted on same land in succession; a second crop rarely. Following a second crop the land should be liberally supplied with vegetable matter and a nitrogen producing cover crop. The writer would suggest seeding to alfalfa.

In this connection beet growing farmers should be informed that at the several factories each campaign there is an accumulation of waste lime which beet growers may obtain for little expense above hauling to the land. This waste lime makes an excellent corrective to injurious acid conditions of the soil and at the same time an important plant food. For in this lime there is usually from three to four per cent of nitrogen, four to five per cent of phosphates and upwards of ten per cent of organic matter. From this it is seen that this waste lime, liberally offered by the factory management, to its growers, is a valuable fertilizer for their lands at a merely normal price.

Concluding this subject, the writer hopes he has made plain the following necessary points to be observed in making the sugar beet crop a profitable one:

Select the field with reference to its fitness in surface and subsoil conditions, drainage and the previous crop.

Plow deeply and thoroughly in the fall.

Make a firm, clean and deep seed bed.

Plant early in the spring as soon as soil and weather conditions are right.

Use plenty of seed to insure good stand, and plant shallow.

Cultivate as soon as rows may be traced across the field, being careful to keep weeds down and the dirt from covering the young beets.

Begin thinning the rows as soon as the fourth leaf appears, spacing about eight inches apart and leaving the thrifty plants.

Keep the cultivator going as long as possible. Keep field free of weeds.

If irrigation is necessary do not flood the fields so that water stands on the surface in the sun.

Rotate with other crops calculated to improve soil conditions as well as to produce crops.

CARE OF EQUIPMENT

Written for California Cultivator
By Sacramento Valley Contributor

There are a number of farmers in the Sacramento Valley who are as careful of their farm machinery as the most successful manufacturer is of the tools and machines in his factory or shop. In fact these farmers might well be called manufacturers for they are in the business of manufacturing food for the human race, the most important industry in the world today.

A farm machine, a plow or disc or seeder or even a shovel, is a part of the working capital of a property. If a farm is considered a business proposition, as it should be, a certain percentage of the value of each piece of equipment must be deducted from the proceeds from the farm each year before the net profit is arrived at, in order to provide for the replacement in in few years of worn-out machinery which is now part of the capital stock of the business. If a machine costs $100 and will be worn out and need to be replaced in ten years, one-tenth of its value, or $10, should be charged off each year for depreciation in figuring what the business has made.

Most farm machinery is used for but a few days a year, so that if it is in good repair and adapted to the work it is used for, that is strong enough and properly made, it should take many, many years to wear it out so far as the actual wear of the principal parts, frame work, bearings, boxes, etc., are concerned. If, for instance, a machine is made sufficiently durable to permit of its being run continuously, as a machine would be in a factory, for five years, and the average work on a farm would require the services of that particular machine for one month of the year, it should be possible, theoretically at least, to use it on a farm for 60 years. In actual experience machines have been known to be in good repair and working order at the end of 40 years on a single farm, but these cases are very rare indeed.

The principal reason for the short life of most farm machinery is neglect and exposure to the elements, but another is that so many improvements have been made during the past few years that it has often been found economy to discard old machines and buy new ones that will do work more quickly and effectively and cheaply even though the old one was not worn out.

Then the average owner or manager of a farm is generally not much of a mechanic and he is therefore not able to adapt an old machine to a new use by rebuilding it.

So that even if it could be conclusively shown that care of machinery could easily effect a saving of many thousands of dollars to the farmers of a state—and there is no question but that it could—and if this was to happen less farm machinery would have to be made and sold. Still manufacturers of farm machinery have little to worry about on that score because the average farmer will be the average wasteful, careless man for years to come, perhaps forever, and money that might be saved and turned into his profit account will continue to go to farm machinery manufacturers. The best that can be hoped for is that some one who reads this may be started to thinking along a line that had not before occurred to him and that it may be the means of increasing some individual incomes. And as far as the machinery manufacturer is concerned the demand for staple articles is constantly increasing because of new lands being put in cultivation, and all farmers are always in the market for any improved tool or implement that will make money in additional crops because of better preparation of the land or that will save money in lessened labor.

Read our guarantee of advertisements in the editorial heading and then proceed, without any hesitation, to deal with our advertisers. We believe they are all right. We have guaranteed them to be all right. Go to it.

To care for machinery should be a genuine pleasure to a real farmer, one who loves the work and takes delight in the proper conduct of the business and the making of money. It should be a source of pleasure and satisfaction to know that every piece of machinery is in its place, protected from the weather and easily accessible when needed, that every ball in it is tight, that every wearing surface is protected by grease or paint, that every place that should be sharp is sharpened, that every piece of framework is protected from rust or decay by a good coat of paint, and that in the doing of this the life of the implement has been lengthened and money made because money has been saved.

"THE HIGH COST, ETC."

The high cost of living which is such an interesting topic for women's clubs and all the rest of us has some comfort when reading reports in London a hundred years ago.

The Globe for March 16th, 1814, contains the following interesting record:

"The extreme severity of the weather has rendered all the fruits and vegetables of the season scarce, and consequently dear beyond all precedent. The following is the state of the prices on Saturday:

Asparagus, £1/11/- per hundred.
Cucumbers, £1/1/- per brace.
Best Pines, £2/12/- each.
Grapes, £3/3/- per lb.
Endive, 8/- per dozen.
Best Broccoli, 16/- per bundle.
French Beans, 8/- per hundred.
Mushrooms, 5/6 per pottle.
Best Kale, 12/- per basket.
Nonpareil Apples, 8/- per dozen.
Colmar Pears, £1/10/- per dozen.
Coss Lettuce, 4/- per dozen.
Mint, 1/6 per bunch.
Greens, 16/- per dozen bunches.
Spanish Onions, 12/- per dozen.

It would be comparatively easy to escape the colic at a "pun" per "brace" for cucumbers.

We are not surprised that some readers, even of this paper, are a bit "leary" of advertising. Every little while we read of swindles perpetrated through the mails on victims that are reached by advertisements. Don't be alarmed about these reports. We will concede to you that too many of them are true, but the victims are not solicited through the columns of this nor any other reputable farm paper. We are seeking, both by precept and example, to teach our readers that every advertisement in these columns is genuine. In any event, we would have you to remember that our guarantee stands back of every name and claim appearing in our advertising columns. Read the guarantee in the editorial heading.

$200 to $300 an Acre
From a Walnut Grove

in full bearing is not unusual and many groves are producing even more. There's money in Walnuts.

MAYETTE! True Wiltz Strain! For productiveness, freedom from blight, and wonderful Quality, the Wiltz strain of Walnuts has no equal in any other of the standard varieties. Late Bloomer.

FRANQUETTE! True Vrooman Strain! Next to the Wiltz Mayette, the best Walnut for Northern and Central California. Late Bloomer.

Our Scions of Franquette and Wiltz Mayette, cut by R. Wiltz, a pioneer Walnut grower, are not only absolutely true to the strain, but are from selected trees. They are the best.

Economics on the Farm

DON'T DESTROY THE INITIATIVE

THE Farmers' Protective League of California is advocating amendments to the election law to prevent the misuse of the initiative to the detriment tiative to the detriment of the material progress of the state. The league makes this announcement:

"The Farmers' Protective League endorses the principle of direct legislation, as do all who are in sympathy with the forward movement. But this organization also takes cognizance of the apparent looseness of the law which permits an inconsiderable number of persons placing upon the ballot measures having alluring titles and containing attractive promise, which threaten the progress and prosperity of the state because their real purpose is not revealed.

"Recognizing the need of a safety valve on the initiative the Farmers' Protective League will urge that the law be amended, and recommends:

"First. That all initiative petitions, duly sponsored, shall be kept available for signatures only at the offices of the registrar of voters or county clerks of the various counties where citizens may sign same during regular business hours; or petitions shall be kept at places where county clerks or registrars maintain offices for purposes of registering eligible voters.

"Second. That no person be permitted to solicit a voter for his or her signature to a petition within the offices of county clerks or registrars or adjacent corridors or on the premises, but county clerks shall cause notices to be posted within their offices calling attention to the proposed initiative petitions, thereby affording all registered voters the opportunity of signing the petitions if they desire.

"Third. A reasonable increase in the percentage required to initiate a law.

"The proposed amendment would accomplish these results: First—Prevent the presentation of fraudulent petitions containing forged signatures. Second—Stop soliciting of signatures by individuals whose sole interest in any proposed measure is the money paid them for their services. Third—Place the responsibility for the initiation of laws upon a larger and more representative number of electors.

"Farmers of California insist upon amendments to the initiative law. Their purpose is not to prevent direct legislation but rather to stop the misuse of a potent power for good. In its present form the initiative law is an evil weapon. Unless some check is placed upon it, agriculturists soon will discover that they will suffer irreparable injury through ill advised laws. Granted that they can, by Herculean efforts and close organization, defeat radical legislation—as they did defeat the eight-hour law—the fact remains that business will be kept in such a turmoil that no person will risk his money in any kind of investment, and especially in farm investments."

We do not agree with the recommendations of the league. There is need for a change and the eight per cent of the votes cast at the last election for governor of the state is perhaps too small, but all who are complaining because of the flood of initiatives with which voters were deluged must bear in mind that they were secured on petitions which required only eight per cent of the votes cast at the last election for governor. At that time the women of California were not voting, but under the law the names of women who were enfranchised at that general election were permitted on all petitions. Consequently eight per cent of the vote at this last election means more than double the names necessary to secure a petition formerly. To secure that enormous number of names by people going to the county clerk's office would simply stall the entire matter because it is probable the clerks could not secure sufficient deputies to accommodate the people who wish to sign. Therefore, the enactment recommended by the league would practically abrogate the initiative privilege. It is well that the league is taking the field to secure more reasonable use of the initiative, but we believe the voters of the state will guard jealously the integrity of this right of the people. That the voters my be better informed as to what the present law is we have asked Attorney L. B. Stanton to give us the requirements of the present initiative law.

Attorney L. B. Stanton

Initiative: Upon presentation to the secretary of state of a petition certified to have been signed by qualified electors equal in number to eight per cent of all votes cast for all candidates for governor at last preceding election, proposing a law or amendment to said constitution set forth in full in said petition, the secretary of state shall submit said law or amendment to the electors at the next succeeding general election occurring subsequent to 90 days after the presentation of said petition or any special election called by the governor at his discretion prior thereto.

Upon presentation to the secretary of state at any time not less than ten days before the commencement of any regular session of the legislature of the petition, certified to have been signed by qualified electors of the state equal in number to five per cent of all votes cast for candidates for governor at the last preceding election, proposing a law set forth in full in said petition, secretary of state will transmit the same to said legislature as soon as it convenes and organizes; the law so proposed shall be either enacted or rejected without change within 40 days from the time it was received by the legislature. If the law be enacted it should be subject to referendum. If the law be rejected or no action taken the secretary of state shall submit it to the people at the next ensuing election. The legislature may reject any measure so proposed and propose a different one, in which event both measures should be submitted to secretary of state at the next general election.

Referendum: Upon presentation of

Wilson's Quality Trees

Are in heavy demand this season. The selection of buds from established bearing orchards, careful selection of seed, causing healthy, vigorous growth—THE REASON. The following letter is one out of many thousands we have received in the past:

Grass Valley, Calif., Dec. 7th, 1914.
Fresno Nursery Co., Inc., Fresno, Calif.
Dear Sirs: In January, 1912, I received from your nursery 210 walnut trees of three varieties, which I am pleased to say have yielded since the first year of planting, each variety bearing a few nuts of excellent quality and TRUE-TO-NAME. I never lost one single tree of your shipment. The 600 pear trees received at the same time as the walnuts are also very satisfactory. My trees have done so well that the local paper has given considerable space about the vigorous growth of my orchard.
Very truly, (Signed) GORDON S. MORGAN.

That tells the story.—Prospective Planters, give us an opportunity of starting you right by supplying strictly first class nursery stock. Send us a list of your requirements for quotations. Our large 52 Page Book describes all varieties of Fruit Trees, Grape Vines, Ornamental Trees and Shrubs, Palms, Roses, etc. We send this book free upon request. Remember we specialize on DECIDUOUS FRUIT TREES, CITRUS TREES, OLIVE TREES, FIG TREES, GRAPE VINES, and Hardy Ornamentals. Write us if you want the best that money will buy. Address

secretary of state within 90 days after final adjournment of the legislature of the petition certified to have been signed by electors equal in number to five per cent of all votes cast for all candidates for governor at the last preceding election, asking that any act or section or part of any act of the legislature be submitted to the electors, the secretary of state shall submit to the electors such act, section or part of such act at the next succeeding general eletion, occurring subsequent to 30 days after filing said petition or any special election called by the gevernor prior to such regular election, and no such act, section or part of such act shall go into effect until and unless approved by a majority of qualified electors voting thereon.

Any act, law or amendment submitted to the people by initiative or referendum and approved by the majority of the votes cast should take effect five days after the date of the official declaration of the vote of the secretary of state. No such act, law or amendment shall be subject to veto of the governor, or be amended or appealed, except by vote of the electors, but acts and laws adopted under the referendum may be amended by the legislature at any subsequent session.

Each signer shall add to signature street number, address and place of residence and election precinct. Petition may be presented in sections and each section be filed wtih the county clerk of the county in which it was circulated within 20 days after filing said petition, the clerk shall determine the number of electors to sign same or transmit to the secretary of state within 40 days after the transmission of said petition by the clerk, a petition containing supplemental names may be filed, which shall be examined by the clerk within ten days and sent to the secretary of state. When the secretary of state has received a petition of one or more county clerks he shall forthwith transmit to the county clerk of every county in the state his certificate showing such vote, which shall be filed for record by such county clerk in his office.

An initiative or referendum in county ordinances may be submitted and a petition filed with the county clerk signed by 20 per cent of the entire vote cast within the county for all candidates for the United States house of representatives at the next preceding general election, in which case the board of supervisors shall either pass the ordinance without alterations within ten days after it is presented or proceed to call a special election in which the ordinance shall be submitted to the vote of the people; or if the petition is signed by electors equal to ten per cent and less than 20 per cent of the vote cast, the ordinance shall be submitted to vote of the people at the next general election in which candidates for congress will be voted for. The remaining provisions are very similar to that of the constitution.

INSURANCE BY MAIL

It is astonishing how mail order business has developed during the past few years. It has been opposed most vigorously by local merchants, but still it has grown, and the only reason for its growth that we can see is that there has been a special demand for it. Much of the mail order business has been developed in the country, and it flourishes there.

We learn that there is an insurance company which seeks to secure its insurance policies by mail instead of by personal solicitation. Whether or not it can succeed only time will tell, but before it has had a chance to try it out fully, a law has been proposed in congress which is aimed at this business and which proposes to prevent this business. The house bill reads in part as follows:

"No company, corporation, association, partnership or organization, nor any officer, agent or representative thereof, or other person, shall use or be permitted to use the mails, or the mail service, or any branch thereof, for the purpose of procuring or effecting a policy of insurance upon persons or property situated in any state or territory of the United States, or for the purpose of collecting the premium on any such policy of insurance, when or where, by the laws of the said state or territory in which the said persons or property are situated, such company, corporation, association, partnership or organization is prohibited from transacting an insurance business in such state or territory."

Such legislation is not designed to protect the people from fraud, for such protection could be secured through a fraud order. If the company is a bad one, it can be reached and punished under existing laws. If it is a good company—reliable and honest,—is not the business it seeks to do just as legitimate as any other conducted through the mails? If not, why discriminate between insurance and dry goods and groceries?

The point of the matter is that such a mail order concern pays no fees in individual states. Neither does the Chicago mail order house with no branch houses. While fees to states may be lost, will not this system of securing insurance lower the cost of insurance to the people of the states? It might cut out needless expense and make possible a lower rate of insurance.

The home insurance company has many advantages over its mail order rival, just as the home merchant has over the mail order competitor. The home companies and the companies operated by local officers should need no such law to hold their own. If they do need it, then it would seem that the principle under which they conduct their business is not economical to the people who pay for insurance. —Washington Farmer.

Time was when history was written by simply rewriting what some one else had recorded. Very few writers of history took the trouble to make original research, so long as some other author had seemed to cover the events in the period under consideration. Now, on the contrary, the history of a century ago is written out of old newspapers and, strange as it may seem, the advertisements reflect the manners and customs and methods of thought more than does the matter which is recorded in the news columns. And there is a very sound reason for this. It is still the custom for advertisers to give expression to every new idea in the advertising space of the papers. One hundred years hence one who would know about the class of farm machinery in use during the year 1914 or 1915 would have to consult the advertising columns of the farm papers of this date; as we have said many times before, our advertisements make most excellent reading and we commend them without hesitation to our subscribers.

"If I were younger and wanted to exploit a great thing I would develop the J. H. HALE peach in California and make a specialty of it by name as a canned fruit of quality and there would be millions in it, rightly handled."

J. H. Hale

J. H. HALE — The Coming Peach for California Canning

Large Size — Round Shape — Rich, Yellow Flesh — Holds Shape and Doesn't "Rag Out"

To growers who realize that the largest profits lie in the highest quality fruit, the J. H. Hale offers a golden opportunity. It is a peach exceptional in size, and this means a peach that can be most economically handled both by the picker and the canner. It cans without stringiness, doesn't "rag out" and gives a clear, brilliant syrup. Its firm, solid flesh holds shape in the can. The color is a deep golden yellow, most attractive to the eye and the flavor is unsurpassed. Mr. Hale's nation-wide reputation gives you an added advantage. Think what a peach canned under his label means.

Superb Keeper and Shipper

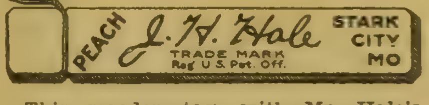
Besides offering unusual features as a canning and drying peach, the J. H. HALE stands shipping and handling better than any known peach. Firm, solid flesh of cling, yet perfect freestone. Heavy, dense, meaty, yet without coarseness or stringiness. Luscious flavor. Colors up a week to 10 days before fully ripe, permitting extra early picking. Ripens about 5 days ahead of Elberta. The one peach for export shipment. Has paid Mr. Hale 33% more than finest Elbertas grown in same orchard.

14,000 Trees Ordered By One Planter

"The Redland Heights Ranch Co., with 1000 acres at Mentone, Cal., just above Redlands, are starting their initial peach planting with 14,000 J. H. HALE trees. They will skim the cream of the markets for years to come with this famous peach. Reserve your trees NOW. Our supply for this season's planting is limited. We furnish you trees budded direct from Mr. Hale's bearing orchards—the same which paid Mr. Hale $1420 per acre.

Refuse Fraudulent Trees!

The wonderful success of the J. H. Hale has brought a host of imitators. An obsolete variety, of no commercial value, known as "Hale's Early" is being substituted for the genuine J. H. Hale. Be on your guard. You can get **genuine** J. H. Hale peach trees, budded from Mr. Hale's own orchards, **only** from Wm. P. Stark Nurseries, Stark City, Mo.



This wooden tag, with Mr. Hale's personal signature attached to all genuine J. H. Hale trees, for your protection.

Genuine Delicious Apple

Most profitable apple you can grow. Brings $1 to $2 per box more than other varieties in all markets, regardless of prevailing apple prices for the season. A renowned success on the Pacific Coast. We furnish special 4 to 6 ft. one year trees direct from our nursery and at grower's prices.

132 Page Book FREE

Full of interesting facts, gives complete description of tree and fruit, most dependable, profitable varieties. Fully illustrated. No agents or solicitors. Our catalogue is our only representative. Buy direct and save 1-3 to 1-2. Book mailed free by return mail if you write today.

The Lawn and Flower Garden

ROSES FROM CUTTINGS

Written for the California Cultivator
By Ernest Braunton

THOSE who yet have dormant wood on roses will find the present a good time to propagate strong-growing kinds from cuttings. Canes about the size of a lead pencil and a little larger are the sort to choose. These should have dormant buds on the wood and the latter cut so that three or more buds are on each cutting or about six inches long. Cut with a very sharp knife just below and just above a bud, about a quarter to a half inch. It is good practice to cut the top end blunt wedge-shape, so that the upper end may easily be distinguished from the one to be placed in the soil.

Hardwood cuttings of roses will sometimes grow under a great variety of treatment and exposure, but it is better to put them in sand or light soil, in the shade, and protected from wind. A surrounding protection of burlap or cheese-cloth on both sides and top to keep away wind and partially darken will be found to contribute to success. The soil should be dug up deeply to allow perfect drainage for the bed should never stagnate with water though it must not be allowed to dry out once. Holes for each cutting should be made with a stick larger than cutting so the latter may be shoved way down in soil without danger of bruising the cut end.

The subsequent care necessary is but a continuation of that heretofore outlined; equable condition, moisture supply, etc. No neglect or exposure should be allowed throughout the summer, nor should cuttings be planted so thickly that good tops cannot grow where they are first planted. About October, if good, healthful vigorous growth has been made, the water supply may be lessened or cut off entirely in order to render the plants dormant or at least partially so by the time the rainy season is upon us. When dormant dig up carefully, without soil, but with all the roots. Keep the latter from becoming dry by protecting from exposure to the air by covering with damp sacks, sand, or soil. Cut back top as individual needs dictate, to one to five stubby stems, and plant in permanent position. Weakly sorts should be budded on suitable stock.

Lime and Explore

Still we should lime, and lime again. Seldom do we use enough lime in the soil, either in garden or orchard, or in any kind of soil. There is hardly a crop that grows that is not benefited by lime and few indeed receive enough. As an aid to nitrification of the organic contents of the soil it is the most powerful agency known.

Again, explore. Delve into the soil as deeply as you can economically, and in stirring deeply to find out how far you may with profit go, you may get a very agreeable surprise. We are doing too much of merely tickling the surface to get the best results in either garden or orchard. Our citrus growers will some day change present practice to the point of seeing how deeply they may with profit stir the soil. It is folly to confine soil feeding and manipulation to tickling the surface when the real functional activities are, or should be, several feet below. So whatever you do with your orchard, stir the garden as deeply as ever you can. Citrus growers will tell you deep plowing and subsoiling will destroy tree roots. If so, the roots are not down where they should be, and this indicates insufficient preparation before planting. In the garden, where crops are constantly changing or we may toy with the individual tree or shrub, we may still get soil one or two feet below the surface that will bear some sort of favorable comparison with that of the top few inches. In all soil operations keep in view the fact that physical condition is of more importance than the supply of artificial plant food. For unless the soil is receptive the food cannot be used to advantage nor the user get his money back on purchases of fertilizer.

TYPICAL YOLO COUNTY RANCH HOME.

The One Best Rose

What rose is best of the many sorts we grow in Southern California? Of course it is impossible for all to agree, or there would now be no war in Europe. What is best in roses depends upon too many factors for one to say with certainty: "This is the

PLACER NURSERIES

best.” Aside from soil, climate, treatment, and own-root or budded stock there comes in the never-ending consideration of individualism. In the writer's garden grow a half-dozen Maman Cochet, and no two are alike as to size and vigor of bush, and while the range in quality of blossom is not so marked, it is present.

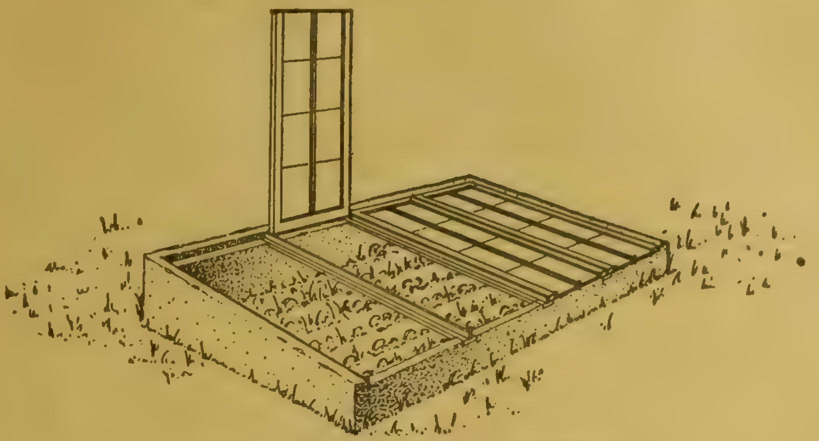
So is it with other sorts. Therefore what shall we say? The best crop of flowers known to the writer for a period of several years was from a Kaiserin Augusta Victoria but in his own collection of more than 100 plants the Madame Abel Chatenay has, throughout ten years and at all seasons, most pleased the mistress of the home, and of course “we” agree. At times several other sorts excel, but the two named have stood the test of years most satisfactorily. The largest and most beautiful closed buds at present, and at all times, are on Betty. The finest bud the writer ever saw, half-open, was a Lady Battersea. The only really white roses of good quality are Frau Karl Drusckhi. In baby roses nothing approaches the bush Cecile Brunner and its fragrance is pronounced and delightful. While considering the odor the yellow Franz Deegan stands high.

Belgian Bays

News comes direct from Belgium that the occupation of the country by invading forces has interfered with the bay tree industry to a serious extent. One grower states that through lack of other shelter as many as 60 German soldiers have slept in one of his greenhouses. While the lives of humans are fairly safe the lives of bay trees are slowly fading, and if the war long continues there will not remain enough laurel to crown the brows of the conquering commanders, no matter which side wins.

A Fine Dwarf Evergreen

Some time ago a well-posted local plantsman was asked what one shrub of low growth he considered superior to all others in the market, and he named Abelia grandiflora. This is by no means an uncommon shrub for it was being sold in local marts a quarter of a century ago, but it is one that has held the popular esteem continuously. It grows about three feet high, has small shiny evergreen foliage of a pleasing green, bears heavy crops of small but showy white bell-shaped flowers and seems to hold its health and vigor in almost any soil and under widely varying conditions.



COLD FRAME GROOVED FOR SASH.

A Rare Acacia

Though Acacia podalyraefolia has been for some years in the local market it has not been widely disseminated. Of all the species so far grown in California it is the most beautiful, either in or out of flower. Many are hardier, more robust, and grow faster, and for these reasons it has not grown in popular favor as fast as its beauty of foliage and flower would lead one to expect.

Small Fruits Vegetables

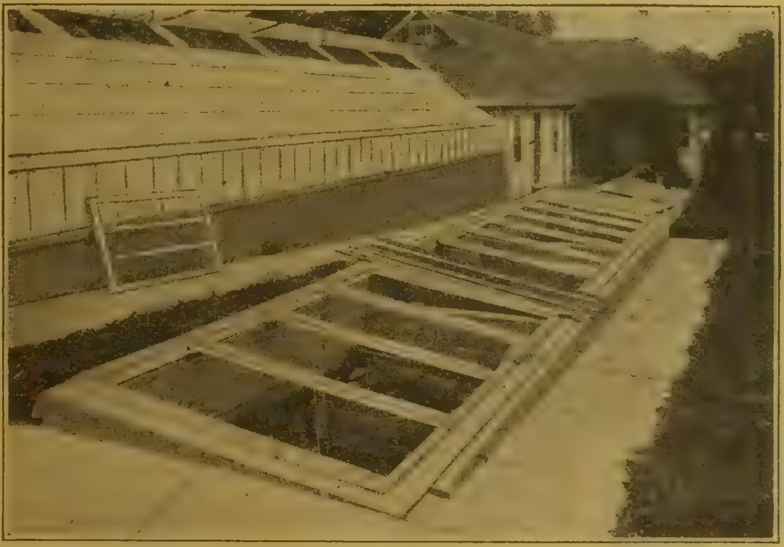
CONCRETE HOT-BEDS AND COLD-FRAMES

Means for Growing Winter Vegetables and Early Spring Plants

There is nothing which pleases the appetite so much as delicacies out of season. As for vegetables, such delicacies are not costly luxuries and are within the means of anyone who will take the time to build and run a hot-bed or cold-frame. Moreover, by this means, one can depend on having good hardy plants for spring planting in the garden.

Proper Time to Build Hot-Bed

September and October are the months to prepare the hot-bed. To avoid annual repairs and to secure the best results build it of concrete. Locate the bed on the sunny, wind-protected side of a building. A four-sash bed is usually large enough except for commercial purposes. A standard hot-bed sash is three feet by six feet. Lay out the bed six feet eight inches wide by 12 feet ten inches long. The concrete walls are six inches thick. Dig the foundation trenches two feet six inches deep within the lines given above. Make forms of one-inch lumber to carry the south (front) wall six inches and the north (back) wall 14 inches above ground. Forms are not required below ground level. The tops of the end walls slope to the others. Before filling the forms with concrete, test the dimensions of the bed by means of the sash. See that the sash lap the forms two inches on all sides.



WELL-LOCATED CONCRETE HOTBED

Mixing and Placing the Concrete

Mix the concrete mushy wet in the proportion of one bag of Portland cement of two and one-half cubic feet of sand to five cubic feet of crushed rock, or one bag of cement to five cubic feet of bank-run gravel. Fill the forms without stopping for anything. Tie the walls together at the corners by laying in them old iron rods bent to right angles. While placing the concrete set one-half inch bolts about two feet apart to hold the wooden top-framing of the bed to the concrete; or make grooves in the top of the concrete for countersinking the sash to the level of the walls with an allowance of one-quarter inch for clearance. This can be done by temporarily imbedding in the concrete wooden strips of the necessary dimensions. During this operation, by means of blocks nailed to the strips, make provision for the center-bars described below. Remove the strips as soon as the concrete stiffens. Take down the forms after five days. The extra two and five-eighths inches in length of the bed is allowance for three center-bars between the sash. These sash-supports are of dressed one-inch stuff, shaped like a capital “T” turned upside down. The length of the stem of the “T” is equal to the thickness of the sash and the top is three inches wide. Sufficient materials for the concrete will be supplied by 14 bags of Portland cement, one and one-fourth cubic yards of sand and two and one-half cubic yards of crushed rock; or 14 bags of cement and two and one-half yards of pit gravel at a cost of $10.00.

Preparation and Care of the Hot-Bed

If the bed is to be used as a cold-frame, it is finished when covered with glass. For a hot-bed, dig out the dirt to the depth of two feet, tramp in 18 inches of fresh horse manure well mixed with leaves or bedding and cover it with four to eight inches of rich soil. Bank the excavated earth around the outside of the bed. Put the sash in place, hang a thermometer on the inside and allow the bed to heat up. After a couple of days, when the temperature has dropped to

(Continued on page 639)

PLANT APRICOTS

Consider these facts—
Market—The entire world.
Demand—Steadily Increasing.
Supply—Grown commercially only in California.
Profit—From $175 to $300 an acre.

Weigh the evidence, and your own good judgment will tell you to plant

SILVA-BERGTHOLDT'S
Foot-Hill Grown
Apricot Trees

Prized for their thrift, hardiness, good root systems and freedom from disease.

Though we have an extra fine block of Blenheims, Royal, Newcastle Early, Moorpark, Routier's Peach, and Tilton on Apricot, Peach and Myrobolan Root, a shortage of good stock is expected this year, so order now and get choice trees.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

MERRY CHRISTMAS

The Cultivator has the heartiest wish for a Merry Christmas season for everyone of its readers, and it will be indeed if the true Christmas spirit inspires us all to make it a happy season for others. Pass on the word of good cheer—better, the cheery good deed.

WRITE A LETTER

Did you write that letter of invitation on December 15, which was last Tuesday? If not, make a Christmas letter of it and make the invitation so warm that all the world will come to California sometime during 1915. It will be a great year for the state; more, it will be a great year for everybody who comes here.

SEND PHOTOS

We are expecting a fine collection of photos to choose the New Year's prize from. For this prize competition we will want the photos of rural scenes to be in this office by the last day of 1914. Send in the photos of the humans, of the livestock, of the orchards or of any rural California scenes.

FROST WARNINGS

The weather for the past week has been sufficiently cold so that many citrus orchardists have closely watched their thermometers and the air currents. The Los Angeles office of the United States weather bureau has been giving most excellent service which is fully appreciated by the citrus growers.

When frost is expected such warnings are incorporated in the regular issue of the daily weather forecast card and the weather map. These publications are mailed at 9:30 a.m., daily, except Sundays and holidays. Warnings are also sent by long-distance telephone; this is an emergency measure and is employed by this office only on Sundays and holidays, and at night when the evening telegraphic weather conditions show a change from the regular morning forecast as printed on the card and map. Evening telephone warnings are filed with the long distance chief operators of both telephone companies not earlier than 6:30 p. m., and generally before 7:30 p.m.

FILE THE CULTIVATORS

The worth of the Cultivator is being shown by the requests which come almost constantly for back numbers to complete files where some particular article has been lost. The semiannual index makes the paper of particular value to every farmer in California and their filing once they are received and read will preserve in most convenient form a fund of information for reference which can be secured in no other way. All the larger libraries of California are preserving the bound volumes of this paper. Just at present we have requests for a copy of the issue of January 12, 1911. Any subscriber who has this particular copy and does not care to keep it to make his own file complete will confer a favor which we will be glad to return if he will mail copy of above date. For the first copy received at this office a three months' extension of subscription will be given.

REPORT OF SECRETARY

The report of the secretary of agriculture for 1914 is now being mailed from Washington. "Evidence abounds that more attention and more intelligent thinking are being directed today to the study of the fundamental problems in agriculture and in rural life than ever before. The last two years have been fruitful of significant state and federal legislative and administrative measures designed to foster agriculture, to improve the distribution of agricultural products, and to better rural life. The people of the nation, urban and rural alike, are keenly interested in efforts to increase the supply of the necessaries of life and recognize the supreme importance not only of making agriculture efficient and profitable, but also of making rural life comfortable, healthful, pleasurable, and attractive. Agriculture has made marked progress in a number of directions, but as an industry it has not kept pace with the other activities of the country."

Among the figures which are more or less interesting we note that the total production of the dairy industry of the country amounted to something over $600,000,000. The production of orchard fruits exceeds 216,000,000 bushels of the value of $140,000,000. If this last figure is correct the citrus fruit growers of California produce from one-fourth to one-fifth of the fruit wealth produced by the orchards of the nation. Of vegetables the nation produces $400,000,000, of hay in excess of $800,000,000. Poultry products are over half a billion, or about half as valuable as those of the cotton field. Last year's wheat crop was the greatest produced in history of the country, approximately 892,000,000 bushels. In cattle, sheep and hogs there has been a decline. The last year's production of cattle approximated about 10,000,000 head, that is, there was a reduction from 50,000,000 head to 41,000,000. There was about the same loss in sheep, while in hogs the former year's total of 63,000,000 was reduced to 58,000,000. Since 1909 the tendency has been downward, and yet since 1899 the population has increased over 20,000,000. In discussing the cause of the decline in cattle the reduction of the great ranges and the fact that there is more intensive farming along some other lines are referred to, but no reference is made to the fact that livestock producers have not had just treatment at the hands of the great packing trusts. However, there is a suggestion that cooperative slaughtering of livestock may lead to the farmer securing more satisfactory returns.

Attention is called in the report to the fact that the standard of production for each person engaged in agriculture in this country is far greater than that of the European farmer, but the production per acre is much smaller. The secretary estimates that the American farmer is from two to six times as efficient as most of his competitors. This is due to extensive farming rather than to the intensive farming usually followed in other countries. The secretary appeals for more diversification, and in making his point refers to the fact that Texas annually imports from other states more than $50,000,000 worth of wheat, corn and oats; Georgia more than $24,000,000; South Carolina more than $20,000,000. Other southern states are given as examples. Along the same line he refers to the fact that the average Iowa farm has six milch cows while the average in Alabama is less than two and in South Carolina, one. While the average Iowa farm has 35 cows the average in North Carolina and Alabama and some other southern states has only four to five. While Iowa has 108 head of poultry on its average farm most of the southern states have from 17 to 20 and in addition it is stated that the average farm home in Georgia has from its own poultry less than two eggs per week, less than two-thirds ounces butter and less than two-thirds pint of milk per day.

After a great array of such figures the secretary adds: "Too exclusive devotion to a single crop anywhere is unwise for normal times and spells disaster in times of disturbance. It is bound to produce just such a catastrophe as has befallen the south in the present emergency. It prevents the full utilization of land and labor, fails to fill the gaps in the work schedules, and furnishes no reserve."

As to animal diseases and their control—bovine tuberculosis is increasing. Of the 57,000,000 animals inspected during the year 533,000 were affected. From hog cholera there was a loss of 6,000,000 valued at over $60,000,000. The Texas fever cattle tick caused a loss of $40,000,000, though some estimates give as high as $100,000,000 as the total loss. As to the foot and mouth disease (the present attack being the sixth which has visited the country), two of the former outbreaks were traced to the introduction of vaccine virus, while the cause of the present outbreak is not yet known, the most plausible suggestion as to its origin is that it was introduced by importation of an article used in tanning.

Marketing and the business side of farming are treated at length. "One of the greatest weaknesses of American agriculture at the present time arises from lack of knowledge of the facts of distribution and business organization, of capital and of resident leadership." Of cooperative marketing organizations there are now amongst strawberry growers 900; peach growers 1800, tomato growers 600, cabbage growers 1700, onion growers 1500, etc. Rural credits, good roads, dealing in cotton futures, and many other matters of vital interest to farmers are discussed. Of course the department hopes to be of vastly greater service to the farmer, and the report gives evidence that much consideration has been given to his problems.

Agricultural Notes

Virginia apples are reported as being well received in Liverpool markets.

The town forest of Baden-Baden, Germany, yields an annual profit of $5.25 per acre, or a total net profit of nearly $67,500.

Forty million tons of potatoes, it is stated, are consumed annually in Germany. Not all of this, of course, is eaten, much of it is used in the manufacture of starch, alcohol, etc.

Quarantines against foot and mouth disease have been relaxed but little. In some states, including New Hampshire, new quarantines have been ordered because of the discovery of the disease in new places. The state of Delaware has issued a quarantine order against the bringing of dogs into the state, in baggage cars or by express.

The Osceola County Fruit and Truck Growers' Association has adopted an official stamp and every package shipped from this county will be marked with it. The design is a circle with the name Osceola Fruit and Truck Growers' Association set around the circle. The name of the place from which the shipment is made will be placed in the center.

It is stated that the Russian ministry of ways and communications is sending to the front a "bath train" of over 20 cars, providing 2,000 baths daily. There is a tank car in case water is unobtainable at any stopping place. Soldiers can be given clean underclothes from the stores carried. There is also a car for drying and disinfecting outer garments and a restaurant car.

The novel plan of increasing imports of American cottonseed oil into northern Africa by introducing modern oil pressing machinery and encouraging the natives to produce better grades of olives has been proposed in a publication just issued by the bureau of foreign and domestic commerce. The idea is that the natives will sell the high-grade olive abroad at excellent prices and then import cheaper oils for their own use.

The fruit growers of the Grand Traverse section of western Michigan are forming a cooperative association for the marketing of their orchard products. The quantity of fruit being harvested each year makes it necessary to secure new markets and to give more careful attention to the distribution. Shares of stock in the association are now being sold and it is hoped that before the spring work begins in the orchards the organization will be sufficiently completed so that the 1915 fruits will be marketed in such a way that each grower will not be the competitor of his neighbors.

Agricultural News Notes of the Pacific Coast

Northern California

Mendocino County papers are a unit in "We want a farm adviser."

War demand for onions has given a material boost to prices in all sections.

The Placer County farm bureau is now working hard to secure a farm adviser.

Humboldt County has the largest dairy association of any county in the state.

A Nevada County potato grower has produced three tons of fine spuds from a quarter of an acre.

Live stock men of Eldorado County are appealing to forest supervisors to keep scrub sires off forest ranges.

A San Francisco capitalist is planning for the making of a 1,000-acre orchard near Pleasant Grove, Sacramento County.

The Fairoaks section of Sacramento County has shipped eight and one-half cars of oranges this season, mostly to New Zealand.

Thirteen Northern California Counties have an acreage of bearing olives which they claim is nearly 49 per cent of that of the entire state.

The Sebastopol Apple Growers' Union reports the sale during the past season of 110,432 boxes of apples. More than half of these were Gravensteins.

A strawberry grower at Placerville, Eldorado County, claims he has produced berries which are equal to those of Atlantic Coast points in excellence of condition.

A 500-bale bunch of Yolo County hops was sold last week for seven and one-fourth cents. At about the same time Sonoma, Mendocino County, farmers secured nine and one-eighth cents.

Farmers over the Sacramento Valley are discussing advantages and disadvantages of the proposed new law which will place all state boards of agriculture and horticulture under one executive head.

For the women of California the Woman's Board of the Panama-Pacific International Exposition has undertaken to furnish rooms and act as hostesses in the California host building during the exposition.

The Humboldt County Dairymen's Association, in regular monthly session, opened bids for spring planting. The matter of conributing to the dairy exhibit at the Panama-Pacific was taken under advisement by a committee.

The county superintendent of schools of Santa Clara County has made the suggestion that pupils interested in agriculture take up a course in milk testing, and has offered a milk tester for the use of any school making application for it.

Fruit growers of Eldorado County organized the Standardized Fruit Alliance at the board of trade rooms at Placerville recently. Officers are William Veerkamp, president; John Harris, reelected secretary for his third term, and the board of directos, C. H. Wildman, U. D. Randall, Charles Schaeppi, J. W. Clark, C. E. Fogg.

Central California

Porterville has been shipping close to 50 cars of oranges daily.

It is proposed to organize a farmers' union local in Tulare.

The district east of Dinuba, Tulare County, is still picking tomatoes.

These are busy days for the milk condensary at Hughson, Stanislaus County.

Fresno is devoting $100 monthly to the maintenance of a municipal employment bureau.

State organizers of the farmers' union have been in Tulare to work for organization of a local.

One Dinuba orange grower ships his entire crop to Saskatchewan, Canada, and markets it from that point.

The state board of health has taken up the matter of green oranges, and will prevent the sale of unripe fruit.

Directors of the Turlock irrigation district have abolished the office of water superintendent for the time being.

Since July 1 more than a quarter of a million tons of California barley have been shipped to New York and to Europe.

Porterville orange packers are reported very well satisfied over prices received in eastern markets for their early fruit.

It is rumored that the vast Miller & Lux holdings on the west side of the San Joaquin Valley are to be subdivided into small holdings and sold.

A rancher near Woodlake, in Tulare County, is experimenting with the manufacture of molasses from sorghum, and the product is said to be excellent.

A dry milk factory is proposed for Crows Landing in Stanislaus County. Farmers of Oakdale, Stanislaus County, are considering growing sugar beets next season.

A mass meeting was recently held at Lindsay, Tulare County, to discuss feasibility of controlling flood waters in the mountains by throwing a dam across the Yokohl Valley.

By a recent court decision a Santa Cruz County dairyman has been upheld in his refusal to pay contract price for baled hay containing a liberal quantity of rocks, old bones and other foreign matter.

At a recent meeting of the San Jose Grange the matter of cooperation, especially on the attitude of congress regarding the Sherman anti-trust law, was discussed. At the meeting sales of prunes were reported at 5¾ cents.

Fresno fruit men are anxious to entertain, for one day at least, delegates to the Fruit Jobbers' Association of the United States and Canada, who will meet in annual convention in Los Angeles the second week in February.

The Modesto Farmers' Union has been reorganized. Newly elected officers are J. M. Bomberger, president; J. K. Carson, vice-president; J. C. Galloway, secretary; Mrs. Pauline Grimes, chaplain; C. J. Perry and A. L. Rutherford, lecturers; J. W. Webb, D. Grundy and G. H. Miller, conductors; D. M. Hackett, doorkeeper.

Southern California

Rialto shipped out her first car of navels December 5.

Ventura County is discussing the good roads campaign.

The Arlington district of Riverside County reports a total rainfall for the season of 1.77 inches.

Bee Inspector J. E. Pleasants of Orange County reports apiaries of his district in excellent condition.

An ostrich farm has been started at Calipatria. Some 600 ostriches have been brought in from Arizona.

The West India Gardens, formerly located at Altadena, will have an extensive nursery at Vista, in San Diego County.

San Bernardino's orange show will be held February 17-24. Many districts have already reserved space for exhibits.

Picking has begun in several Covina orange groves; the fruit testing sufficiently sweet to meet government requirements.

Brawley melon growers are already agitating some method of marketing that will assure them of a large proportion of profits.

Fontana, San Bernardino County, will feature a small model packing plant as its exhibit at the coming National Orange Show.

The Farmers' Club of Mound, Ventura County, at its November meeting, discussed the matter of the lima bean contest, both past and future.

The Claremont Pomological Club held a meeting December 5 at the citrus experiment station at Riverside, 175 members of the club attending.

The Ventura County Swine Breeders' Association now has a membership of 27. They recently met with the farm adviser and discussed best practices of the industry.

San Pasqual Valley, near Escondido, San Diego County, claims to put up some butter of "some quality." San Diego County people often ask for San Pasqual butter.

The yield of cotton in the Palo Verde Valley in Riverside County, this year, will break all records, many farmers reporting a bale to the acre the first clipping.

The Orange County Vegetable Growers' Association, composed of 135 members of the Villa Park district, marketed about $100,000 worth of produce the past season.

Some hundred thousand tons of beets have been worked up at the Los Alamitos factory this season. The slicing season is now over but the sugar refining will continue for some months yet.

At the recent annual meeting of the Covina Citrus Association the report showed that 626 carloads of oranges have been sent out from the packing house during the season just closed. The following officers were elected for the coming year: Anton P. Kerckhoff, president; J. R. Elliott, vice-president; George Anderson, secretary and manager; W. P. Watts, J. F. Brock, Herman T. Headley, P. H. Maurer, W. H. Overholtzer, Irwin Shupp, Jr., Grant Chapman.

The Coast

Many Northwestern apples are being shipped to England.

A hog show is being held at Pullman, Washington, this week.

Plans are being instituted to install a farm adviser at Tumwater, Washington.

Many horses of the Northwest are being purchased for shipment to Europe.

The Pacific Inernational Live Stock Exposition was held at Portland, Oregon, last week.

Farmers near Colfax, Washington, have organized a cooperative fuel and lumber company.

The O. W. R. & N. Company held a corn show at Walla Walla, Washington, November 25-28.

Reservoirs holding water for live stock have been constructed on the ranges of Yavapai County, Arizona.

Farmers of Whitman County, Washington, have shipped a car containing 623 sacks of flour to the Belgians.

Yakima hops are selling from seven to 11 cents. The crop in that section this year will aggregate about 32,000 bales.

Wool producers of Baker and Grant Counties in Oregon are urging growers to hold for at least 25 cents per pound for the next clip.

Sheep men of Navajo County, Arizona, have organized a county wool growers' association. C. Hess of Holbrook is the secretary.

Farmers of Arizona are gratified at results secured by demonstration train trips in that state. Other trips will be taken up early in January.

The Washington State Dairymens' Association convened last Wednesday morning at Chehalis, Washington. It will continue until Friday evening.

The Oregon State Hop Growers' Association, a strictly cooperative institution, is urging its members to refrain from contracting, and to that end is advancing money to the members where necessary.

The entire destruction of a herd of 101 pure-bred Holstein cattle shipped to Spokane, Washington, and found to be diseased with foot and mouth disease, has resulted in the complete eradication of the disease.

Plans for Farmers' Week and the Congress of Conferences to be held at the Oregon agricultural college at Corvallis in January, 1915, call for a remarkably attractive session. Indications are that the attendance will be large.

At a by-products convention, held at Spokane recently, 10 men from various sections of Oregon and Washington were named as a Central By-Products Board, which is to organize fruit growers of the two states in order to save wastes and check selling rivalry.

Experts of the department of agriculture state that the standard of American draft horses will not suffer because of the interruption of foreign importations, there being a sufficiently large amount of pure blood already in the country. It is thought the American draft horse will now have an opportunity to show its worth.

Live Stock and Dairy

SILAGE FOR CALIFORNIA

Written for California Cultivator
By Sacramento Valley Contributor

"WHY should one put up silage in California?" asked a newcomer from the middle west who has read of the mild climate and long growing season, grass the year round and no zero weather, a story told and truthfully, too, in all of the advertising matter about our beloved and wonderful state. "Why should it not be cheaper to grow soiling crops and always have green feed to graze or cut daily and feed?" questions the man who does not want to spend any more than is necessary on buildings and equipment.

Labor is a big factor on a farm, and while the soiling proposition is a good one, a great deal of labor is required in planting, caring for and harvesting the crops that will be used for soiling. When a field of grain or hay or corn is cut and harvested and taken care of all in one job, the per acre or per ton cost can be kept down to a reasonable figure, and the same is true of planting a big field of grain or corn—but in a soiling system there is a "puttering" job of cutting, raking, hauling in, and feeding every day, and every few days a job of planting so as to have the crops come on in rotation. On many farms the labor factor would be an expensive luxury; on some others it might work out with economy. Then during the part of the year when an abundance of feed is required—the winter months—the growth of vegetation is slow as compared to the warm growing weather of summer and a large acreage in soiling crops.

On high priced irrigated land, capable of maximum crops, such things should be grown in their proper season as will make the largest amount of feed from a given area, and while soiling crops can be used to advantage a part of the time, alfalfa hay must be cut and stored and corn must be put in the silo. Advantage should be taken of every bit of feed-making energy the farm possesses.

The farm on which the silo is a necessity is of course a livestock farm, and the object of this kind of an establishment is to produce and market the largest possible amount of finished product every year.

Let us see how such a farm might be planned. Assuming a good 40-acre irrigated farm with 30 acres of it always in alfalfa, but rotated so as to give 10 acres of alfalfa sod to be plowed every few years, the 30 acres of alfalfa should, according to many calculators, keep 30 cows for a year. If the cows will do well on alfalfa alone they will do better and pay a much bigger net revenue if fed 20 pounds of corn silage a day in addition. A 100-ton silo will hold 200,000 pounds—30 cows will require 600 pounds a day at 20 pounds per head—so that this silage would, if fed that way, last 350 days, practically all of the year.

The 10 acres of alfalfa sod, well manured, should easily produce 20 tons of corn for silage per acre; it should produce double that in fact, for in Michigan over 50 tons of corn silage has been produced per acre. But at 20 tons per acre enough feed will be grown to fill two silos or one silo, and leave five acres of corn for soiling or to harvest to fatten hogs on. Then this field that raises the corn can grow a barley crop, planted in winter or spring, and cut for grain hay or harvested by hogs on the ground before the ground is irrigated again and the corn planted in June.

In this assumed case the silo makes it possible to greatly increase the production of an alfalfa fed herd or makes it possible to carry more cows or other cattle or sheep or hogs on the same farm than could possibly be the case without it. This farm properly handled as a business proposition should also buy and feed a considerable quantity of grain every year—as a most satisfactory dairy ration for the highest production should have some grain in addition to alfalfa and silage.

The principal dairy and stock feed of California, alfalfa, is sweet and rich in protein. Corn silage is sour, succulent and rich in carbohydrates. Protein is a high-process food product and because it is easy to raise we are very prodigal of it. We make it take the place of cheap carbohydrates. In the east the condition is the reverse; protein feeds are scarce; carbohydrates plenty. Beside being wasteful to burn up protein in making bodily-heat and energy when corn will do it just as well, there is too much sameness to an all-alfalfa ration. Granting that alfalfa is the best single feed we have, it must be admitted that no single feed is as valuable as a combination of feeds. The value of corn silage in various feeding tests is estimated at from $4.00 to $6.00 per ton. To feed with an abundance of alfalfa as a balancer it may be worth much more in specific instances. It should be put in the silo for less than $1.50 per ton.

Almost any crop may be put in a silo, but Indian corn is acknowledged to be the best. The stalks cut into one-half or three-fourth inch lengths with the mixture of grain and leaves and succulence packs well, ferments well and keeps well. Sorghums develop almost too much acid and the stalks of milo maize and Egyptian corn are pretty dry and woody, although all will make silage, as will first or any cutting of alfalfa full of foxtail and weeds or grain. The beards of foxtail are softened in the fermenting process so as to be made inoffensive.

We know of no better argument in favor of carboyhydrate silage than for any one interested to visit some man, and there are many of them in California, who is feeding corn silage. Experience and satisfaction on the part of the man who must make money from the use of the silo or quit using it is the most conclusive of all. One silo is generally the forerunner of two or three or a whole battery of them. And this is the answer; corn silage is a success in California.

FOOT AND MOUTH DISEASE DEMANDS RADICAL METHODS

Foot and mouth disease has made its appearance in this country for the third time in 12 years, having been introduced into New England in 1902, in the middle eastern states in 1908, and just recently in the middle western states.

The disease affects cattle principally, but all cloven-footed animals are susceptible, so that swine, sheep, and goats are sometimes stricken with the disease. Human beings sometimes contract the infection by drinking milk from infected animals or from handling animals having the disease.

Foot and mouth disease is remarkable for the swiftness with which it spreads, says H. Preston Hoskins, of Minnesota University Farm, St. Paul. The disease is spread by contact, and any object that has been contaminated with the discharges from the sick animals may convey the infection to healthy animals. The germs of the disease may be carried on the shoes or clothing, by vehicles, on the hoofs of animals, by dogs, cats or birds.

The disease is not necessarily fatal, although a small percentage of affected animals may die. One attack of the disease does not confer permanent immunity. An animal may have the disease two or three times. Affected animals usually recover without any treatment.

The most prominent symptoms are a high fever, loss of appetite, and the formation of vesicles (blisters) in the mouth, on the tongue and lips, and sometimes on the udder. Similar eruptions take place between the toes at the coronary band and cause extreme lameness. Animals with marked foot lesions often lie down and refuse to get up on account of the pain of standing. Affected animals frequently stand with the head down and with streams of saliva flowing from the corners of the mouth. Marked disturbances of the digestive organs are often observed.

The United States is the only country in the world that has demonstrated its ability absolutely to eradicate the disease, and it is to be hoped that the methods which have been successful before will speedily check the present outbreak.

In general the plan is to slaughter all infected and exposed animals, bury them in deep trenches and cover the carcasses with quick lime. Infected premises are thoroughly disinfected and quarantined. No live stock can be brought to the premises for four months. Public highways in infected territory are closed to traffic. Persons are not allowed to visit or leave infected farms. Feed and bedding exposed to the infection are burned. Owners of slaughtered animals are reimbursed on the basis of utility value, appraisement being made by a practical stockman and an official of the federal bureau of animal industry. One-half is paid by the federal government and one-half by the state interested.

WHAT SAMPLING REVEALS

A herd owner may ascertain from the creamery that his average is 40 pounds of fat per cow for the month and yet have a dim idea that some of his cows are better producers than others, but probably few men are prepared for the veritable surprises encountered when they commence regular weighing and sampling. To take the case of two two-year-old heifers that freshened this spring, last month one gave 30 pounds of fat, the other gave 46 pounds. One five-year-old in the same herd of grade Jerseys gave 67 pounds of fat, and another five-year-old gave only 36 pounds. The owner would scarcely believe that one mature cow is thus earning, with fat at 27 cents per pound, $8.37 more than her stable mate in just one month. What will the difference be for the whole year? That is the crucial test.

Between two three-year-olds in the same herd, that both freshened in March, there was a difference last month of 19 pounds of fat, worth $5. Similar differences are to be found in many herds, illustrating very clearly that it is palpably unfair to take a general average of the herd unless they are decidedly more even in production than those cited above. Records of individual production alone can give this valuable information to the owner.

ANOTHER GREAT ONE

Superintendent Gardner of the advanced registry of the Holstein-Friesian Association writes:

"The Holstein-Friesian cow, Duchess Hengerveld Korndyke, has broken the record for fat production in the senior three-year class of the semi-official yearly division, by producing in 365 consecutive days 903.38 pounds fat from 22,897 pounds milk. She freshened at the age of 3 years, 9 months, 19 days. Her sire is Judge Hengerveid De Kol, No. 43964; her dam is Duchess De Kol Korndyke, No. 52905. She was bred by Mr. O. A. Stubbs, Lewisville, Indiana. In the senior three-year class of this division she displaces Queen Juliana Dirkje, whose record for 365 days is 817.38 pounds fat from 19,124.3 pounds milk. Five different supervisors were employed in the conduct of this test."

The profits in dairy farming under present conditions come only to the men who have the grit and gumption to weed out their small-yield cows.

Increased Separator Efficiency

The best cream separators often fall below expectation simply because they are not properly lubricated. The separator is your most delicate farm machine. It demands an oil especially made to suit it.

Standard Hand Separator Oil

is just such an oil. It is made for separators and it is of just the right body to quickly reach those finely adjusted, close fitting bearings. It protects them from wear. It enables your separator to deliver *all* the butter fat. It eliminates unnecessary repairs and lengthens the life of your machine. There is no better oil made for your separator. Ask your dealer for it.

Stop that cream leak
NOW
with a
DE LAVAL
Cream Separator

WHY continue to separate cream by either "gravity skimming" or an inferior or worn out cream separator that loses cream for you every day just as surely as a leaky cream can?

You may have less milk just now, but with "old" milkers and cold weather your cream loss is greater than in spring or summer. Cream is worth more now, too.

If you will test your skim-milk you will see for yourself that you can't afford to wait until next spring. Let the De Laval start saving cream for you right now and it will earn a large part of its cost by spring.

See the nearest De Laval agent at once, or if you do not know him, write us direct for any desired information.

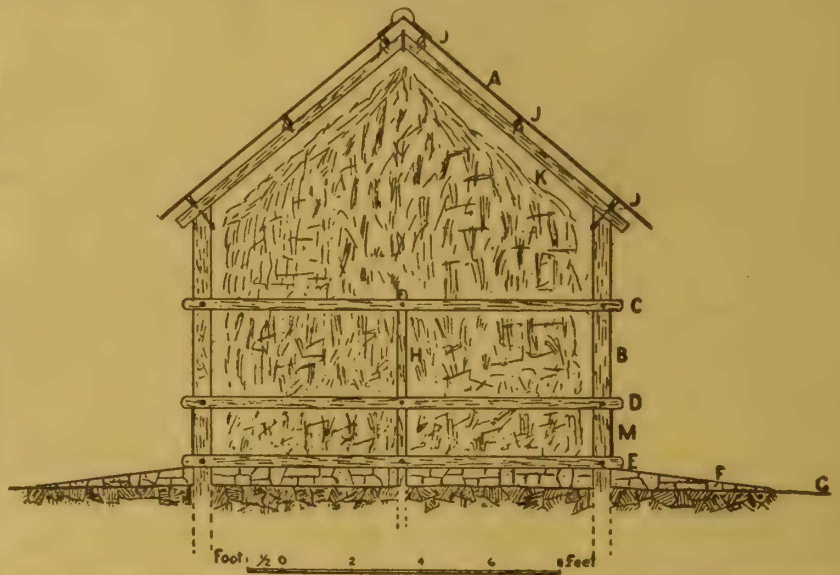
BLACK LEG LOSSES SURELY PREVENTED by Cutter's Blackleg Pills. Low-priced, fresh, reliable; preferred by Western stockmen, because they protect where other vaccines fail. Write for booklet and testimonials.
10-dose pkge. Blackleg Pills $1.00
50-dose pkge. Blackleg Pills 4.00
Cutter's Blackleg Pill Injector 1.50
Discounts: 250 doses, 10 p. ct.; 500 doses, 20 p. ct.
Use any injector, but Cutter's simplest and strongest.
Every package dated, unused pills exchangeable for fresh after date on package. Do not use old vaccine (ours or any other), as it affords less protection than fresh. Insist on Cutter's. If unobtainable, order direct. Send check or M. O., we pay charges and ship promptly.
THE CUTTER LABORATOPY, Berkeley, California.

ECONOMICAL FEEDING

Referring to an issue of the Cultivator of some months ago in which we gave illustrations and description of the method of feeding beef cattle on the ranch of the Porterville Alfalfa Company, Mr. S. McIntosh, director of irrigation of the department of agriculture of South Australia at Adelaide, writes of methods carried on in that country. He says:

"As a distant subscriber to your valuable publication I desire to congratulate you on your paper. The issue of August 13 is of particular interest to us who are interested in irrigation in this state, and throughout Australia generally, in the matter of cover crops on our orchards and vineyards, particularly the former. I have sent the issue in question to the editor of 'The Murray Pioneer,' Renmark, so that the irrigation subscribers generally may have an opportunity of becoming acquainted with what you are doing in the matter of cover crops in California.



AUSTRALIAN METHOD OF COVERING AND PROTECTING HAYSTACK.
Stock allowed to feed and framework may be moved in as fast as stock clean up the hay.

"The issue of August 6 also contains an interesting article on feeding cheap alfalfa to high priced beef. This is a matter that has had my attention for a number of years past, and under separate cover I am forwarding you a copy of bulletin issued by this department in which special attention is called to the system I adopted a number of years ago. You will note that the system recommended is, if anything, an improvement upon that adopted by the Porterville Ranch Company. At present we are carrying a very considerable number of poor cattle on alfalfa or lucerne which is forked indiscriminately into the feeding enclosures. Sufficient fodder is carted in to last from two to three days, and when the cattle have eaten as far as they can reach the balance is then forked out to them. We have dispensed with a roof but some farmers consider that a temporary roof justifies the expenditure."

From Bulletin No. 59, Lucerne Cultivation and Management, we quote from an article written by Mr. McIntosh:

"Some years ago (1904) I adopted a method of stacking both green and brown hay intended for general feeding, which I can with confidence recommend as being most economical and satisfactory in every sense, more particularly in regard to labor saving in feeding. The accompanying sketch gives the reader a general idea of how to proceed. The stack should be erected on fairly high and hard soil, and the foundation should be "made up" with the backscraper or grader as shown on the plan, to allow a good drainage. Narrow stacks of not more than from 10 feet to 15 feet in width are recommended, with an eight-foot or nine-foot wall. After the hay has settled, or when it is required for use, posts are erected eight feet apart around the whole structure, or as much as it is intended to use at once, at about nine inches clear of the stack. If no roof is required the length of the posts is six feet six inches by about four inches diameter at the small end; they are sunk two feet in the ground. A breast rail (four inches by two inches hardwood) is then bolted in eight foot lengths to the posts with three-fourths-inch bolts two feet from the ground surface. Below this any straight timber or lumber can be used for the mangers. Galvanized iron cases suit admirably. At a further height of two feet six inches, i. e., the top of the posts, a head-rail of four-inch by two-inch hardwood is bolted to the upright with three-fourths-inch bolts. You have now a one-sided manger with the haystack as the feed supply. The stock feed direct between the breast and head-rails, and any loose straws drop into the nine-inch vacancy, there to remain until the face of the stack is fed down to the full depth of the manger. When the stock have eaten out the stack to the full length of their reach the fence is simply shifted into the face, or the hay can be raked down from the roof into the now perfect feeder. Personally I prefer removing the fence, as you are then sure your stock have an ample supply of feed at all times. Should a roof be required posts ten feet long are used. In the event of no suitable round timber being procurable, six-inch by six-inch jarrah or red gum is suitable. The tops of these are cut off at an angle to which the lower rafter holding the galvanized iron (in eight-foot sections) is bolted with a five-eighths-inch bolt. The two top rafters (one on either side of the roof) meet, and one-half-inch bolts fasten the two opposite roof sections together. In the accompanying sketch ridge-capping is shown, but it is not necessary. Both fence and roof are made up of eight-foot sections, with the end of the rafters and rails scarfed, so that they may be fitted into the adjoining section and the whole structure bolted together. This permits one side of the roof being removed to facilitate the erection of a new stack on the same site, or the ready removal of the whole affair on to a new site, in the event of the stock fouling the original stand. Where the stack is roofed, the hay must be raked or thrown into the feeder after the first face has been fed off. The three principal factors in favor of this system of feeding are; the great saving in labor; the complete saving of the leaf, the minimum waste after stacking; and the insurance against short food supplies as long as the stack is available. The three-inch by two-inch V. D. L. slats between the posts are to prevent cattle from horning each other. In the event of sheep feeding from these stacks a lower manger is required and the hay is forked into it.

"Another method of treating cut lucerne is what is known as "sandwiching." Where clean, fine wheat, oat or barley straw is procurable this is certainly the most economical system of feeding. The lucerne is cut as for hay, but instead of letting it dry, it is stacked within 48 hours of cutting. Proceed as follows: First, a two-foot layer of clean straw is put down on a bed of dunnage, over which is sprinkled from 15 to 20 pounds of dry salt per ton of straw. A two-foot layer of semi-green lucerne is then added, with further additions of straw and lucerne until the stack is finished. The moisture from the lucerne gradually soaks through the straw layers, carrying the salt with it in solution; and thus the whole body is permeated with the natural juice of the lucerne. My experience is that the stock are just as partial to the straw thus treated as they are to the lucerne itself. I cannot recommend lucerne for ensilage, as it is much more valuable as green fodder or hay, added to which it is not a perfect silage plant."

THE SMITH SALE

The George A. Smith sale of pure-bred Holsteins resulted in the change of ownership of 71 head at an aggregate of $16,970, or an average of $230. The cows averaged $326.87 while bred heifers averaged $260 and even heifer calves commanded an average of $165.58 and bull calves $151.11. These averages were all much greater than those of Mr. Smith's first sale.

The highest priced cow was purchased by P. Rietkerk for $505, while T. J. Crist purchased the top-notch bull calf at $300 and the McAlisters the highest yearling heifer at $400.

The highest bred heifer was purchased by R. F. Guerin at $410.

The following sales were made: A. F. Blanton, Kerman—Segis Ormsby Fobes of Glennaire and Homestead Walker De Kol Pietertje. A. B. Comfort, Hanford—Wisconsin Ormsby De Kol. T. J. Proper cooling of cream just as soon as it comes from the separator is most essential, stirring the whole lot every time fresh cream is added to the quantity. Frequent churning prevents the cream from becoming old and musty or moldy by the development of bacteria.

STABLE MANURE

Of all the fertilizers known for improving and keeping up the fertility of farm land, stable manure is most practicable to use, and in the long run it is the best for enriching the soil. Manure from animals fed on rich feed and bedded with litter in sufficient quantity to keep them clean, has always verified the claims of its advocates.

Stable manure by reason of results obtained where it is used to improve soil, has stood the test of ages in comparison with all other materials containing plant food.

Soil fertility and profitable farming will continue season after season so long as sufficient quantities of both solid and liquid stable manure of good quality is intelligently applied to the soil. Not only is it possible under this system of soil improvement to harvest in a temperate climate during a single season one huge crop of hay, but two, three or even four crops.

The day has arrived in agricultural pursuits where a money making farmer cannot afford to haul inferior fertilizers to his field.

The business of farming at present demands the richest plant food at the least cost, plant food that will return the largest profits. Rich stable manure has neither an equal nor a competitor. It contains not only the plant food elements, nitrogen, phosphoric acid and potash, that the high-grade commercial fertilizers possess, but at the same time excels them in vegetable material for making humus, since no commercial fertilizer contains humus making material to any extent worthy of the name. Rich stable manure is acknowledged to be very efficient in promoting the work of bacteria so necessary in crop production. The manure from animals when applied to soil improves the texture and mellowness, increases the water holding capacity, promotes better aeration, and increases the soil temperature. Its mechanical effect on heavy clay land is most beneficial, as here its use helps the close texture by loosening the packed soil grains, and thus increases the productivity of the soil.

HOGS GOOD HAY GRINDERS

There does not appear to be any more practicable method of grinding hay for hogs than by feeding the hay via a good rack.

A few years back some enthusiast wrote a story about alfalfa tea, which he said was the finest thing on earth; that the tea extracted all the animal food in the alfalfa and at the same time, left the plant food for the soil. By giving the tea to the hogs they would gain their weight, and then you could scatter the stewed alfalfa back on the land. The story found its way into one of the eastern publications and the western experiment stations have been flooded with inquiries ever since.

Increasing the productivity of the herd is a slow process but it can be done if the farmer is studious and persistent, says J. B. Lindsey of the Massachusetts Agricultural College. Breeding pure-bred bulls to the best grade cows is probably the most economical method to follow. Better care and more feed are needed by a herd averaging 7500 pounds of four per cent milk per year than one averaging 5000. Nevertheless, the higher the yearly production the less will be the cost per quart of milk.

Goat and sheep men are endeavoring to secure a state bounty for coyotes.

If interested in deep well pumping you can have a copy of this book by writing for it. It contains information about the POMONA DEEP WELL PUMP, and also valuable data on irrigation subjects. When writing ask for "Catalogue No. 54C," and state the depth of your well and its location.

The Pomona Double Action Deep Well Pump

is of the plunger type with reciprocating plungers, traveling in opposite directions, the one with a slow up-stroke, the other with a quick down-stroke, and a substantial "lap," thus having the descending plunger in place ready to receive and carry its load before the ascending plunger has reached the end of its stroke, traveling a substantial "dead" distance together, the one receiving, the other giving up its load gradually. Cylinders, valves and all other parts are made of the best materials that money will buy, and are built to stand up under heavy deep well lifts and to give years of satisfactory service.

Pomona Hoists

—have been made by us for 12 years and give good satisfaction. Cranking shafts are on same level making it unnecessary for man operating it to reach up and down. Load always held safely in suspension. No pawls to throw out. Write for prices and further information.

Pomona Gates and Valves

are made by us in a complete line of sizes for use in cement pipe irrigation. Special valve catalog "C" will be sent free on request.

STEADY AND QUIET ECONOMICAL OF FUEL

Western Gas Engines consuming special gas oil at 2⅔c per gallon, cost one-third of a cent per HP. per hour to operate.

All our years of engine building experience are concentrated in the new model WESTERN GAS ENGINES. We have left out every unnecessary part. Wearing parts could not be made better. We have built long life and supreme satisfaction to engine users in every WESTERN GAS ENGINE we are turning out. Compare these engines point for point with any on the market, then decide for yourself. We build them every part alike and standardized, on the very finest automatic machinery, with the highest class of skilled labor, under the supervision of master mechanics. WESTERN GAS ENGINES are built in one of the finest equipped factories in the country by master engine builders. The many orders we are now receiving proves that the WESTERN GAS ENGINE is the ideally all-round, all-purpose engine for ranch work.

Before you buy an engine send for our catalogue—free to all who write for a copy.

THE COLOR OF EGGS—A COMPARISON

Written for California Cultivator
By Jean A. Koethen

LOS Angeles is one of the few large cities in the country that makes no discrimination as to the color of eggs. In San Francisco the "extra" must be not only fresh and sweet and large, it must also be white. In Boston, the city of baked beans and brown bread, it is quite natural that the "extra" should be a brown egg. In New York the white egg is preferred.

This discrimination as to color in the large markets has, of course, nothing whatever to do with the quality of the eggs. It is made in the markets of New York and San Francisco, which are controlled by the white egg producers, to keep out the brown egg of the middle west, and in Boston, I presume, to keep out the white egg of New York and Pennsylvania. This is perfectly understood by commercial poultrymen; it is not always understood by the novice who is considering the selection of a breed.

Such a distinction is quite natural and proper under the circumstances. The commercial poultryman, who invariably keeps White Leghorns, is probably the most important man in the great billion dollar poultry industry, and if the brown eggs, which are produced more cheaply on the farms of the middle west than they can possibly be on the egg farms of either the Atlantic or the Pacific coast, are dangerous competitors, they must be discriminated against. This does not mean, however, that it is necessary to insist that the white egg is a better egg.

L. E. Keyser, the veteran New York poultryman and writer, says that three objections are made to the brown egg: That eggs with shells of mixed colors do not present so attractive an appearance when displayed for sale as all-white eggs. This is probably true, but when we talk of brown eggs we do not mean "eggs of mixed colors." There are various shades of brown and tinted eggs, running all the way from a faint cream to a deep, reddish-brown, and the producer who mixes all shades together when he markets them simply does not know his business. The first thing for any brown egg producer to do is to breed his hens to lay the same shade of egg, and until he has accomplished this, to market different shades in separate packages.

I think no one would be so biased as to maintain that a carton of dead white eggs of uniform size and shape is any more attractive than a carton of creamy white eggs, or brown eggs or pink eggs, also of uniform size and shape and tint. To my mind the white eggs look pale and sickly beside the rich pinkish-brown of a fresh-laid Orpington egg, but this is a matter, no doubt, of liking the things we are used to.

2. That brown eggs can be less readily candled than white eggs, which means a loss of time to the dealer. This might be recognized as a valid objection to the brown egg if all markets and dealers uniformly paid a higher price for white eggs. Until they do, we may pass it by as unworthy of comment.

3. That brown eggs cost more to produce than white eggs. This may be true. I have not the data to disprove it, though as far as I can see, by comparing my two breeds, the white egg hens, when they are laying well, eat about as much as an Orpington. When they are not laying, they eat less than an Orpington that is not laying. Some writers declare that a Leghorn will lay on hardly more than half the feed required by a Rock or an Orpington, but I have seen it stated in a report of the egg-laying contests at Storrs, Connecticut, that the Leghorns eat fully as much as the Rocks. A Rock or an Orpington will eat more than she needs if she can get it, and these large hens usually do better laying on a restricted diet.

It is no doubt true that Leghorns can be kept intensively and on very little ground, as the heavier breeds cannot, and this is their one indisputable claim to supremacy as commercial egg producers. It is not at all certain that they eat less or that they lay more eggs—that is, as a rule—nor do they lay as large eggs as some of the heavy breeds, but they can be kept in close confinement and in large numbers and have been more carefully bred for egg production.

4. That the brown egg cannot be tested out of the incubator before it is so old as to be unfit for food. Mr. Keyser says the man hatching white eggs "can test on the third day while the infertile eggs still have a food value, while dark eggs have to remain in the machine until unfit for any purpose and are a total loss."

Either Mr. Keyser has never incubated any brown eggs or he is just talking "hot air," as the boys say. I have many and many a time tested out Orpington eggs on the seventh, eighth or even the ninth day and used them fried for breakfast next morning and no one could tell that they were not fresh eggs. In many the yolk was less inclined to run than it sometimes is in a fresh laid white egg.

Having disproved of the very worst objections that can be made to brown eggs, we are in a position to consider the points in their favor.

In Bulletin 128 of the United States department of agriculture, a table is given comparing eggs of various fowls and also the white and brown eggs of hens. The figures for the latter are as follows:

White shelled eggs as purchased: Refuse, 10.7 per cent; water, 65.6; protein, 11.8; fat, 10.8; ash, .6; fuel value per pound, 675 calories. Brown shelled eggs as purchased—Refuse, 10.9; water, 64.8; protein, 11.9; fat, 11.2; ash, .7; fuel value per pound, 695 calories.

The brown eggs, it will be noticed, contained a little more protein and considerable more fat. They have in general rather a larger yolk, which would be expected since they contain more fat. On the other hand the white egg, according to tests made at Cornell, has a somewhat heavier shell. The bulletin concludes: "The figures quoted in the table show that there is practically no difference in composition between hens' eggs with dark shells and those with white shells, although there is a popular belief in some localities that the former are 'richer'."

My own preference for the brown egg is based not on its composition but on its size and weight, texture of shell and the thickness of its white. The brown egg has a harder shell, and when it is broken the yolk remains deeply imbedded in the white. When a white egg is broken the yolk often runs into the white. This does not affect the food value of the egg, but it does affect its appearance in the frying pan. Break a brown egg into the pan and the white puffs up about the yolk in a frilly sort of cup. Break a white egg and it spreads out and runs into its next neighbor. Since my attention was called to this difference I have talked with many women, women who raise eggs, women who buy them, and women who sell them over the counter, and the invariable word is, "give us brown eggs."

A year ago, being not altogether satisfied with the performance of my Buff Orpingtons, I let most of them go and brought eggs of a much boomed white egg breed. The two breeds have been laying side by side now since last March, so I have had a good chance to compare their eggs and I have been so disappointed in the white egg layers that I am selling them off and buying new Orpington stock. Of course no comparison can be conclusive. It may be that the Buff Orpington lays an extra large and hard shelled egg. I think that it does. It may be also that the white egg breed I have lays a particularly poor egg, or that it is a poor strain of the breed. The fact is, on the same soil, and with the same care and feed, the brown egg layers have laid a uniformly firm shelled egg with a good, stiff white and deep, yellow yolk. while the white egg layers have laid soft shells, thin shells, chalky shells and eggs with such thin watery insides that I was actualy ashamed to market them as first-class eggs. I have no use for an egg with a yolk that runs the day it is laid.

This fall I had an opportunity to compare the performance of Orpington pullets with pullets of my white egg breed of exactly the same age, and my Orpingtons are laying not only bigger eggs but more of them. The white eggs average an ounce and a quarter to an ounce and a half in weight, while the Orpington eggs run, most of them, two full ounces each. In other words the Orpingtons at eight and nine months of age are laying eggs which could go on the market as "extras," while the white egg will, for some time to come, sell as pullets' eggs.

I have never before been guilty of booming my own breed—indeed, I have not always appreciated it—but when Mr. Keyser declares patronizingly that, "there may be no material difference in the quality of the eggs, but the white eggs are the more appetizing and people are willing to pay more for this quality," it makes me a wee bit indignant. By all means let the white eggs command a higher price where they can, but don't pretend that it is because they are better eggs. We of the brown egg cult ask nothing but the truth.

RAISE YOUR OWN SUNFLOWER SEED

By Prof. E. B. Babcock.

The Mammoth Russian sunflower is a cultivated variety of the common wild sunflower of that portion of the middle west extending from Kansas to Mexico. Our wild California sunflower is another species which resembles that of the middle west in the numerous branches and many small heads, of no value as a source of commercial seed. Though the entire plant may be used for feeding dry or for ensilage, the seed of the cultivated variety is much prized for bird and poultry food and for the manufacture of oil. The Mammoth Russian variety has an unbranched stalk and a single large head with many large seeds. In Russia these seeds are used as human food.

Many California farmers plant Mammoth Russian sunflower to raise poultry food and frequently are disappointed by having their fields badly mixed with plants of a branching, small-headed type, even when they have taken the trouble to purchase new seed. This is due to the fact that sunflower seed is cheap and our seedsmen either import it direct from Kansas or contract with some California farmer to grow it for them, and in neither case does the grower of the seed take the necessary precautions against mixing with the wild plants. Obviously it is not profitable to raise a crop of sunflowers when one-half or even three-fourths of the crop turns out to be unprofitable branching plants, yet this has been the experience of many farmers.

But if it is practicable to raise your own seed, why not do so? That it is practicable will be seen at once when you understand the secret of seed production in the sunflower. The secret is this—a single sunflower plant will not set seed unless it is cross-pollinated with pollen from some other plant. Bees are the usual agents in this process. Knowing this secret, it is at once clear that if a seed grower allows wild plants to grow near enough to his Mammoth Russian field so that the bees work back and forth freely between the wild and the cultivated plants, it is certain that the seed he offers for sale will be badly mixed.

How shall the farmer proceed to raise pure Mammoth Russian seed? First, by selecting a seed plot as near the center of his place as possible and by taking pains to keep down any wild sunflower plants that appear as weeds. Second, by selecting the seed for his seed plot from Mammoth Russian plants that are separated as much as possible from wild neighbors. Third, by watching his seed plot before the plants begin to bloom and simply cutting off at the ground all plants that have any branches. This will insure pollination exclusively with Mammoth Russian pollen, unless a few bees come from distant fields of wild plants. By following this method for one or two seasons he can have a practically pure strain of seed, and by keeping up the breeding plot under

Increased Production

The standard of poultry living and profit can be preserved and greatly increased by feeding

Coulson's Egg Food

When you take up a handful of Coulson's Egg Food you scarcely realize that you are looking at a dozen or two dozen eggs. But such is the case. The hen utilizes this food in the production of her eggs. It gives her the elements out of which she manufactures her product.

Coulson's Egg Food is not a stimulant—it is a food, and as such acts as an AID to egg production.

By insisting on Coulson's Egg Food—by refusing substitutes—you will be paving the way for a good yield from your flock, and at the same time giving your birds the VERY BEST at no additional cost.

Send for our free book, "Chickens." It is intensely interesting and instructive.

these conditions he can plant fields of sunflowers anywhere without danger of loss from the influence of wild sunflowers growing as weeds on surrounding property.

FIRST EGG CIRCLE IN KANSAS

The first "egg circle" reported in the state of Kansas was organized in Lyon County in April, says the Spokesman Review. This organization has very appropriately been named the "Quality Egg Company." It is in fact a federation of egg circles, one in every neighborhood that wishes it, with headquarters and a central organization at Emporia. Every circle has its own officers—a president, vice president and secretary-treasurer.

The egg circle is one of the latest products of the movement for more effective rural cooperation. Its great advantage lies in solving the marketing problem. Strict rules are laid down as to gathering and caring for the eggs, so strict in fact that one is inclined to be skeptical as to whether they will be observed, remembering the conditions under which eggs are produced and marketed on the average farm.

But in the Quality Egg Company, a breach of the rules is punishable by the loss of the offender's membership, which means that the stamp with which the eggs are marked must be turned in. The rules specify that all eggs must be gathered at least once a day, and twice on very cold or very warm days. They must be kept in a cool, dry place and marketed at least twice a week. Only strictly fresh eggs are to be sent. Every member agrees to pen up or otherwise dispose of all male birds from June 15 to September 1.

Every Egg Can Be Traced

By means of the stamp every egg can be traced back to the farm from which it came, making it a simple thing to place the blame for bad eggs. Every circle in the federation is designated by a letter—A, B, C, D, etc., as far down the alphabet as there are circles. Members in the circles are numbered and every member's stamp bears the circle letter and individual's number. This stamp is placed on the large end of every egg before it is marketed. Thus, an egg stamped "A-22" signifies that it came from member No. 22 in circle A. Reference to the secretary's books completes the identification. The stamp costs a member 35 cents and membership dues are 25 cents, which constitutes all the expense there is connected with becoming a member.

New neighborhood circles are being organized from time to time. There is a widespread interest in the movement and what the ultimate size of the organization will be would be difficult to foretell. The number of members in a neighborhood circle is limited only by the facilities for collecting and marketing the eggs. At present members living at convenient distances from each other are taking turns about in delivering the eggs in Emporia.

Headquarters of the organizations are maintained at Emporia in a four-room building with barn and hitching sheds in the rear. The building contains an office for the manager, two packing and work rooms and a rest room for women. The manager's salary is provided for by means of a fixed commission allowed on all eggs handled.

All eggs are paid for at the rate of one cent a dozen above the prices paid by Emporia commission houses. At the end of every month accounts are squared and the balance accumulated as profits is prorated to each member according to the quantity of eggs he or she has marketed.

All eggs sold by members are graded. Grade No. 1 consists of clean eggs of a uniform color, well packed in neat cases or cartons, and weighing not less than 24 ounces to the dozen. Grade No. 2 includes clean eggs neatly packed and weighing not less than 21 ounces to the dozen.

Every case of eggs sent out by the company bears the name "Quality Egg Company" conspicuously lettered upon it, and also contains other advertising literature. By this means and by keeping up a high quality of product it is hoped that a widespread reputation for these eggs will be built up.

BEES

Beekeeping Pays Big—Price list, bees, instruction books, etc., free. Spencer Apiaries Co., Box 14, Nordhoff, Cal

THE PEACH AND HOW TO GROW IT

(Continued from Page 611)

When they are delivered to the purchaser the trees are full of fruit spurs developed by pinching and pruning.

Thinning

When I see well shaped trees, properly thinned, I am almost tempted to go call on the owner and pat him on the back for his far sightedness. How many such orchards does one come across? It is a crying shame to see orchard after orchard, branches all broken in many instances and loaded down with a lot of stuff two-thirds of which should be fed to the hogs. Where is the economy in producing such fruit? You don't build up any business if it is in a depressed condition by selling an inferior product, and least of all a dried fruit business. Any grower who argues that he cannot afford to take care of his fruit is making the mistake of his life when he does not thin his peaches. You do not have to stretch your imagination very much to figure out the difference in cost of cutting a 50-pound box of peaches in which each peach weighs close to a pound, and one in which the peaches will not weigh more than one-half a pound each. There are twice as many pits in such fruit, and in connection with all this the fact that it lacks both the size and the quality of a well-grown peach makes it a very inferior product, for when dried it is practically all skin without any flesh. And what does the packer do? He won't buy it at all if the market is off, or if he does buy and ship it it is to a cheap trade that knows nothing about high class California dried fruit. It costs seven cents per 50-pound box to pick peaches. The cutting, sulphuring and drying and putting into the sweat boxes will average one and three-fourths cent per pound when dried. The loss in weight, depending on the variety of fruit, varies from five to seven pounds green to one of dried.

Dont' overdry. This is a common fault, and the loss of weight is no small item. Just as the fruit passes out of the mushy stage entirely—and this occurs after five to seven days' exposure, if the temperature ranges around the 100 degrees mark in the shade—stack your trays and allow the drying, until the fruit is scraped off into sweat boxes, to proceed from this time on in the shade. When the peaches are slightly leathery to the touch they are dried sufficiently.

Canning Peaches

No argument is required to advise the grower that it is imperative, in order to have merchantable stuff to deliver to a cannery, that all the fruit be two and one-fourth inches and over in diameter, otherwise it will not be received. The average price over a period of ten years for canning peaches is not less than $25 per ton, and in years where there is a short crop prices go skyward, and it is not uncommon for a grower to receive from $50 to $60 per ton for this fruit. Such prices mean to a grower—where trees range from six to 15 years—returns of from $250 to $400 per acre. Returns like this pay amply for a number of years of low prices.

Varieties

If there is any one country in the world where fruit growing has resolved itself into a commercial proposition, it is right here in California. Experimenters who are devoting their time to originating new varieties should bear in mind that the desideratum to be reached is not the developing of a long list of novelties which may have a somewhat different colored skin or a shape slightly different from that of varieties already grown; this is not the goal which we should seek. It has been demonstrated time and again that it is not a string of varieties which is necessary to make fruit growing a success, but rather a few kinds standardized, because they meet the requirements necessary for success.

Today the Alexander, Admiral Dewey, Elberta, Foster, Hales Early, Heath Cling, Lovell, Muir, the Orange Clings, Phillip Cling, Salway, Sims Cling and Tuscan Cling cover the entire field for peaches required for shipping fresh, drying and canning.

The improvement demanded in our shipping peaches is to secure varieties which will mature earlier than those already grown in the early types and of better carrying qualiies. In the dying peaches, varieties which will dry heavier, have smaller pits and firmer flesh will be welcomed as valuable acquisitions.

In canning peaches—and this probably applies to clings more than anything else—varieties with more flavor, absence of red at the pit, greater firmness of the flesh and a rich golden color, when canned, will contribute to elevating the canning industry.

It seems difficult to understand, but it is a fact nevertheless, that there is no active demand for either dried or canned white peaches. The McKevitt and Heath Cling are exceptionally high class canning peaches, but their white color, which to my mind is in no way detrimental, militates against their sale. There are many strange anomalies in the fruit business. All the yellow cling peaches shipped out of California are branded "Lemon Clings," because this has become a fixed trade name. As a matter of fact this peach is absolutely lacking in the essentials necessary to make a first-class canned peach and has not been grown in California for years, and nowhere else, for that matter, where its inferiority as a fruit is understood.

Planting

Trees should never be planted closer than 24 feet apart unless they are interplanted with some other variety of fruit with the expectation of taking the peach trees out at some future time. The trees as they stand in the nursery rows have the limbs removed to a point about 12 inches from the ground. Instead of removing all those limbs when topping the tree to 20 inches, these laterals should be cut back to two inches, so in case the buds in the main body do not start in the spring the smaller branches will.

COST OF UP-KEEP

We have asked several as to the cost of keeping up the automobile and find that there is wide diversity of opinion. One will say, "It simply costs gasoline and oil, and not much at that," while another will state that the cost is prohibitive. Why the difference? Perhaps the first is a bit enthusiastic and, like the teller of a fish story, enjoys the making of an especially good showing. Aside from that feature there is no question but that it makes a great difference who runs the machine, and more as to who repairs it. A large auto dealer told the writer with great emphasis that without question the auto owner who did his own repairing would get much longer life from his machine than where the repairing is done in the shop. That seems strange, but the opinion is confirmed by many. The owner who takes pride in the appearance and running of his auto knows the moment the first bolt loosens, and it is attended to at once. The man who runs his machine as long as it will stand up and keep in action, then has a general overhauling, has permitted serious injury to his car which the overhauling will not overcome. As one dealer remarks: 'The stitch in time does not save nine with the auto but, in fact, it saves ninety-nine." Therefore, let every auto owner care for his own machine and care for it when needed rather than when forced to.

But as to the cost, assuming that the machine will run 6000 miles a year, with ordinary care, it will take a set of tires per year. Tires are guaranteed for 3500 miles, but with ordinary treatment they are probably good for at least 6000. A 34x4 tire costs $29.35, therefore one may readily see the year's cost of tires, though it is not probable that even on the 6000-mile basis all the tires would be out of commission the first year, so that perhaps four times $29.35 would be too high. The cost of tires depends a great deal on condition of roads, air pressure and amount of care exercised by the driver. Nothing destroys a tire quicker than allowing it to run on the rim. Some maintain a pressure of 65 to 80 pounds constantly. In any case, always keep the tires hard.

The average mileage per gallon of gasoline is probably not far from 15. On the basis above mentioned this would mean 400 gallons of gasoline per year. At, say, 15 cents, there is $60 for gas, or about one cent per mile.

The requirements for oils will probably be not far from 15 gallons per year, that is, the machine will run approximately 400 miles per gallon and the cost be about 75 cents. This would mean an additional $11.25 per year.

Then repairs, outside of new tires, might be $5 per month. They also might be $50 per month, therefore no figure even close to approximating can be given on this point. With a new machine, however, the first year's repairing should be almost nil. Consequently, how much it costs to keep an automobile it will be impossible to say. Several auto owners have replied in an offhand way that the costs enumerated, together with depreciation, interest on investment, and all, would be not far from $300 per year, or $25 per month. Depreciation depends upon the viewpoint, that is, the tradesman who is talking of taking over a used machine will count on from 35 to 40 per cent depreciation for the first year. We imagine, as a matter of fact, that 20 per cent would be nearer the real, true depreciation, but so many of us wish up-to-date models that trading is very general, and on that basis the first year's depreciation should be considered. However, if 40 or 45 per cent were deducted for the first year, then a depreciation of 10 per cent would probably be conservative thereafter, but where one buys a machine to keep it, 20 per cent, or the turning of the machine to the scrap heap in the period of five years, would be a safe basis.

Make Money Pulling Stumps!

Add new, rich, crop growing land to your own farm by clearing it of stumps. Clear your neighbors' land. Your Hercules will be kept busy when others see what it does. Big profits for you. With the

Hercules All-Steel Triple Power Stump Pullers

you can clear an acre a day. The *known* and *proved* stump puller all over the civilized world—easiest to operate.—most durable. Special introductory price, 30 days' trial offer, 3 years' guarantee, on immediate orders. Write for big Free book of land clearing facts.

Barley Beard Fistula

Have a horse that has a running sore under his jaw. It was caused by barley beards and has been this way for over a year although he has been working right along and has not suffered. I have been injecting peroxide, creolin, etc. This sore runs into the throat or mouth, for when I inject anything some of it comes out of his mouth. It is no better than when I commenced treating him. Would like to know how to treat it and what medicine to use.—Subscriber, Santa Susana.

Sometimes when barley beards work through at the root of the tongue it leaves an open tract all the way and the saliva flowing through keeps it open. Soon a false membrane grows around the canal and it will not heal. You must get rid of that membrane by cutting it out or by putting in a caustic that will burn it out. Try injecting nitrate of silver, 20 grains to the ounce of water. It will never heal while you are using peroxide.

Fistula Near Ear

Would you kindly inform me through the Cultivator what can be done for a colt that has a small hole in the head between the left eye and ear, as shown on enclosed picture? A watery liquid runs from the hole constantly. Do not know what caused it.—Subscriber, O. R.

Frequently those small fistulas on a colt near the ear are there from birth. They usually lead to a small bony tumor and in that bony tumor a small ill shaped tooth is often found. Or if it is of recent origin it may have been caused by the pressure of the halter. In any case the treatment is to cut down to the bottom and remove anything you find there. Also cut out the tube through which the fluid has been flowing. Then you have just a common wound to heal and by keeping it clean nature will do the rest.

Sows Fail to Breed

Two sows that farrowed a month ago had each two dead pigs that were not more than half grown and partly decayed. A third had but three pigs and refused to own them. Two were bred the third day but are in again now. The third one bred three weeks ago has a white, rather thin discharge. Several gilts have been bred but are now in again. Male about a year and a half old, pureblood Poland China in good condition and apparently in good health. Hogs all running on alfalfa pasture and feeding sow's mik and grain. Do hogs have contagious abortion and do you think dead pigs had anything I could have prevented?—Subscriber, Rio Bravo.

If the sows that had dead pigs had others that were all right then probably they were hurt in some way while carrying the pigs. Hogs might have contagious abortion, but the symptoms you give do not indicate that these had it. You bred them too soon after farrowing and the male was probably infected from the dead pigs and carried it to the others. You may have some trouble geting rid of it. They should be treated by injecting a solution consisting of carbolic acid one dram, alcohol one ounce and water one pint. The male should also be treated. After a month or two you might be able to go ahead again all right.

Abscess Following Puncture

Two months ago one of my cows became bloated on alfalfa and it was necessary to puncture her. For two weeks the wound did not seem to bother her but since that time there has been a continuous discharge from it, sometimes light and sometimes very copious. The discharge is usually thin but sometimes it is a thick pus and very offensive. Aside from the sore she seems all right. Every day the wound is washed off with hot water and soap, after which a disinfectant is poured on it. What shall I do with it?—Subscriber, Farmington.

I presume the abscess is only under the skin in the flesh. Cut the opening larger so you can wash out the cavity freely. Use a sharp knife. Push it into the wound an inch or more and cut a gash two inches long or more. Cut down and draw the blade out as you cut. The opening should be long enough so it will drain freely. Wash your hands clean and with one finger examine the cavity to the bottom. Wash it out well with plenty of warm water. Then inject into the cavity a pint of warm water with a teaspoon of carbolic acid in it, letting it run out as fast as it will. This should be done once a day until the wound heals clean and healthy. Then just see that it is clean until it heals.

A SCHOOL—COMMUNITY CENTER

Less than ten years ago the 10,000 acres or so of the Packer Ranch in Glenn County was owned and operated as one big grain ranch. Today the Packer tract, one of the parts of the Sacramento Valley irrigation project, is one of the best examples in California of what subdivision and irrigation will do for a country. Dozens of families are developing productive dairy and fruit farms and doing the other things that make a high class citizenship and develop a state and nation.

One of the most striking evidences of this development is the beautiful new Codora school, located on the Packer tract which makes up a large part of the Codora school district. The building was recently completed at a cost of over $12,000, and is located on grounds five acres in extent.

There is now an attendance of 69 pupils who are taken to and from school by automobile at the expense of the district.

Aside from being a fine building and modern in every respect, it is planned to be a real community center as well. There is a large assembly hall with a fine stage, a room well heated, well lighted and well ventilated. And beside the children's playgrounds there has been made provision in the grounds for a big area for hitching sheds for horses and for parking automobiles, a ball ground, an orchard of specimen trees and plots in which pupils studying the elements of agriculture can grow crops.

It will be the center of interest for this thrifty and growing community, a frequent meeting place for all the people, where the newcomers from all parts of the country will meet and become better acquainted with each other and with the old-timers who have lived in the country for years. Social intercourse and a discussion of troubles and problems and the mutual working out of the solutions thereof are factors in the upbuilding of every community, but often these things are not accomplished for want of a suitable meeting place. By the wisdom of the leaders of this community the meeting place problem is settled for all time. And as the years go by and the trees and shrubs and flowers increase in size and beauty the Codora school community center will continue to be more and more a popular meeting place for those who have created it. The example can well be duplicated in every rural community in America.

A Tip on Almonds

On this continent Almonds are grown only in California. The American market alone demands *four times* the present supply.

With practically an unlimited home market and a monopoly of the product

Plant Almond Trees if you are seeking a real money-making investment. We have an extra fine lot of trees growing on Bitter Almonds, Peach, and Myrobolan Root, but as there is usually a shortage of trees on Bitter Almond, place your contract immediately—don't delay.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Water Commission

Answering a query as to water commissions:

We understand that all disputes as to water rights will be settled by the water commission. In fact, that is the reason for the enactment. Of course no commissioners have as yet been appointed excepting that ex-officio, the governor, and the state engineer are two of the five, but as soon as they are appointed doubtless a method of procedure will be formulated. As to cost, we are unable to say. Page 42 of the amendments to the consitiution and proposed statutes, which are sent to every voter in California prior to election, gives the full text of the measure.

Milch Goats

Can you give me information regarding milch goats? Which is the best breed? Do they require much feed? Do they do well on alfalfa pasture? Has the Cultivator ever published any articles on milch goats?—Subscriber, Orosi.

The Cultivator has published articles several times on the milch goat. For instance, in the Cultivator of January 8, 1914, we printed an article by Winthrop Howland of Redlands on the value of goat's milk. Goats do well on alfalfa and of course the amount of feed required depends upon the quantity of milk being given. There are several breeds, the Toggenberg perhaps being the most popular in the United States. The milk usually retails in large cities at about 25 cents per quart, but unless delivery can be made to some of the larger hospitals it requires a special line of trade to be developed.

Plowing

The coming year I wish to plant apricots on rather sandy land. Should this be plowed at the first rains or how shoud it be fittted for orchard planting?—Subscriber, Halcyon.

If this land had been seeded to vetch or some other legume, or possibly rye, in September or October, and then plowed deeply just before planting time it would perhaps have been in best condition. If no green crop has been planted, however, we would do the final leveling and plow as soon as possible. This would throw up a loose soil into which water and air would penetrate freely and in case of excessively heavy rains it will take in more of the water than would be the case if the soil is allowed to lie hard and compacted. We would follow each storm with harrowing. By tree planting time, which, with apricots by the way, will be within a few weeks, this ground should be in fine condition.

Hens Not Laying

Can you tell me why my hens are not laying after a month or two of laying? They are fully feathered and in fine shape every way as far as I can see. I feed barley and blood meal soaked over night in hot water, dried up with bran, in the morning, corn or wheat at night and they run on the lawn in afternoon. Good, pure water to drink and also scraps from the kitchen to eat.

A sudden change in the weather, such as we have experienced the past two weeks, will often check the laying of hens, especially if they are of the lighter breeds or exposed to rain or wind. A change in their roosting quarters also checks laying for a time. You do not say how much blood meal you use with the morning feed of bran and barley, but the ration contains too little ground grain and probably too little animal protein. Beef scrap or fish scrap is generally used rather than blood meal, because it is less concentrated and therefore more easily digested. Suppose you try the following very simple dry mash, keeping it before the hens at all times: Two parts bran, one part ground barley, one part middlings, one part corn meal, one part alfalfa meal, one part beef scrap, one-half part fine bone meal, a little charcoal. In addition to this feed sprouted oats or barley in the morning and wheat with a little whole corn at night and give your table scraps and as much green feed as possible at noon. If you have sour or

ORANGE LEMON GRAPE FRUIT LIME TREES

WE are digging our citrus stock now and the trees are splendid. We never handled or grew finer trees. They are of large caliper, well branched and absolutely free of all insect or fungus pests. We have about 75,000 trees to dispose of during the coming season which accounts for the low prices at which we are offering them: Oranges, Navel and Valencias; Lemons, Eureka; Grape Fruit; Limes. These are not "cheap" trees. They are first class in every particular but we are overstocked. The trees can be seen any time at our Nursery Salesyard back of the big store.

We also carry a full line of ornamentals, parking and street trees, roses and fruit trees. We invite your inspection.

skim milk feed the dry mash moistened with the milk at noon instead of the table scraps. You might cook your table scraps and mix them with the mash, if you wish.—J. A. K.

Grape Shipments

What is the percentage of increase in grape shipments from California between 1903 and 1911? What is the percentage of increase in raisin production in California? What countries produce the most raisins?—Subscriber, Ontario.

The number of cars of table grapes shipped from this state during 1903 was 1804; in 1904, 1451; in 1908, 3819; in 1910, 4948; in 1912, 6357; in 1913, 6363. California's raisin crop in 1884, which is the first year's figures we have access to, appears in pounds, at 3,500,000; in 1885, 9,400,000; in 1886, 14,460,000; in 1890, 38,000,000; in 1895, 91,000,000; in 1900, 90,000,000; in 1905, 87,000,000; though some years preceding this last year the production reached as high as 120,000,000; in 1910, 115,000,000 pounds; 1911, 120,000,000; 1912, 185,000,000; 1913, 130,000,000. Exports increased from some 3,000,000 pounds in 1898 to over 28,000,000 pounds in 1913. Imports, on the other hand, decreased from 53,702,220 pounds in 1884 to 2,579,705 pounds in 1913. In the production of raisins, Fresno County stands first with 94,000,000 pounds, Tulare second, with 25,000,000; Kings third, with 20,000,000. After Kings there is a heavy drop down to less than 4,000,000 pounds produced by Sutter County, which is fourth. San Bernardino crowds close up to Sutter, however, in total production.

Orange Grove Neglected

I have taken over a neglected orange grove. The trees are covered, both leaves and stems, with a black mildew or rust. What is the best treatment to clean the trees, also to eradicate mealy bug which is thick between the fruit?—Subscriber, Almada, Portugal.

Here is a question for the farm doctor to solve. That is, there are probably many steps necessary to put this orchard in good productive condition. The first thing to do is to give a thorough fumigation or spraying to rid the trees of the black scale which is probably the cause of the "black mildew" or ordinary smut, a fungous growth which follows the honey dew exuded by some of the scale insects, aphis, or other pests. Within a short time after the fumigation or spraying, if well done, the fungus will disappear, probably with the first rain, though if it covers the fruit washing may be necessary in order to make it marketable. The next procedure would be with the soil. A heavy application of stable manure would be the best method of putting that in good live condition. Pruning to get rid of much needless wood and more wood which has been injured by the scale infestation might be necessary and would probably give a new top to the trees which would make new bearing wood, possibly next year and surely a couple of years later. At blossoming time the application of stable manure might be folowed with a complete fertilizer in which nitrate is in fair supply. This would help set fruit for the coming year. If these points are observed and general good care with deep culture of the soil is given for the next year or two it is probable the trees will be put in good productive condition.

Replanting Bulbs

Will you please tell me what to do with little bulbets that come close to the stem and almost out of the ground on some varieties of lilies? Also best fertilizer for them? — Subscriber, Covina.

Our inquirer does not say what kind of lilies she refers to, so it is impossible to give explicit information, but presumably breaking up the clusters of bulblets and planting individuals so as to give room for bulb development will result in a far greater number of flowering bulbs another year. If very small plant only an inch in depth but for well developed larger bulbs plant the usual depth, which may be five or six inches according to the variety and size.

The best fertilizer is probably any complete commercial fertilizer. At least do not plant bulbs too near to a mass of stable manure. If it is used it should be as a mulch.

Pruning Apple Trees

At the recent horticultural convention at Los Angeles a group of delegates were discussing tree culture and reference was made to the best season for pruning apple trees. One delegate maintained that such trees should not be pruned in winter if growing in a neighborhood where the temperature fell below freezing. He stated that he always pruned his trees after blooming, say from April 10 to June 1. He also said that he planted his trees just as they came from the nursery, that is, did not cut back, that he got better results by leaving the entire tree. As a beginner in fruit culture I would like to know the general practice in this matter.—Rancher.

There are all kinds of theories as to the growing of fruit, and strange as it may seem to some of us who have decided opinions along certain lines the fellow who does not agree with us often succeeds in raising quantities of good fruit. However we believe we are safe in saying that it is the general practice to winter prune and that better fruit is secured from trees which have been properly pruned at planting time, and thereafter regularly each year when the tree is entirely dormant. We believe the better practice is to top a tree at planting time back from 24 to 30 inches. We know that many farmers who plant trees feel that to cut away three-fourths of the top of a tree which has cost 20 or 30 cents is like throwing away that much money, but really all a tree does for the first three years is to form a foundation for fruit-bearing wood. Allowing this foundation to grow up into the air five or six feet and to be ill-shapen, as it often is when neglected, results in a short-lived tree and one more liable to wind and sun injury. The strong wood growth which is induced by winter pruning will give a mass of material which another dormant season will need to be cut off and probably more wood will be taken from the tree than will be left, but bear in mind a large stocky branch or "foundation" should be left for next season's growth to build on. We have heard those who do not believe in pruning say that it is as reasonable to amputate a man's arm that he may do better work as it is to cut off the branch of a tree that it may do better work. While that may prove a sharp reply in an argument it has not made good in actual practice, as is shown by observation of the more successful fruit growers.

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Probating Will

How should an executrix of a will proceed? Is it necessary to employ a lawyer, and if so, how do they charge, a straight fee or a per cent of the estate? If the deceased had real estate in Kansas and California does the will have to be probated in both states?—Subscriber.

A will must be probated in all states where there is real property in order to convey the title. It is practically necessary to employ an attorney. The will must be proved, the executors appointed by the court, accounts of the administration of the the estate rendered, title to the property properly attended to and the executors finally discharged. The fee in probate cases is to a large extent dependent upon the character and condition of the estate. The statute allows a fee of seven per cent on the first $1,000, four per cent on the next $10,000, etc. Sometimes however you can obtain a straight fee.

Life Estate

A certain piece of property has descended by will as a life estate, the father leaving to his son all the rents, incomes, and profits thereof during the period of the son's natural life, but at the son's death to go absolutely to his children, share and share alike. Now this son has two children. One of the boys has sold his interest in his father's life estate. Is this transaction legal? Can the buyer of the right, at the death of the father, in any manner gain precedence over the remaining heir as to the disposition of the property or otherwise? What happens if the son who sold his right should die before his father? If this transaction is not legal is there a time limit in which it can be set aside?—Subscriber.

So far as stated the transaction is entirely lawful. The remainder in the property invested in the children, probably as tenants in common, the purchaser of the interest of the son steps into the shoes of that son and has an undivided one-half interest in the property. The remainder being invested in a son upon his death would go to his heirs or assigns. The title to real property may at any time be questioned, but to question a will opposition must be made within one year after probate. The statute of limitations as to real property is five years after the date of the acquisition of the right.

SPECIAL SALE of
Farm Implements

Startling reductions in many lines. We are preparing to move from one of our warehouses into a new one and find hundreds of items that we wish to close out rather than move. Prices are sharply reduced for quick sales.

Plows, Harrows, Land Rollers, Ridgers, Drills, Transplanters, Cultivators, Mowers, Rakes, Feed Cutters, Cream Separators, Barn Equipment, Gas Engines, Scrapers, Vehicles, Wagons, Trucks, Garden Tools, etc.

We can only give you a rouch idea of the principal items. Not all styles or sizes are included, but plenty for you to pick from. You can save money on almost everything you need—but remember, the quantities are limited. Make up a list of what you need and write or call and see us.

Please remember that we are not moving our office and salesrooms—merely one of our warehouses. You will still find us at the same old stand.

SING A SONG OF CHRISTMAS

Sing a song of Christmas,
Gladdest day of all;
O'er the hills and valleys
See the splendor fall.
Sing of geaming holly;
Sing of mistletoe;
Sing a song of Christmas
Everywhere you go.

Sing a song of Christmas,
Holy, happy day;
Sing of Bethelehem's manger,
Where the Christ-Child lay.
Sing of love unbounded—
"Peace, good will to men."
Sing a song of Christmas
O'er and o'er again.

Sing a song of Christmas;
E'en on this glad day
There are griefs and heartaches
All along the way—
Hearts that wait the uplift
Of your note of cheer;
Sing a song of Christmas,
Strong and sweet and clear.
—Edith Virginia Bradt.

CHRISTMAS EVE REMORSE

I wisht (just tonight) that I didn't know's much
'Bout things that's important, like Santa and such.
I wisht I was ign'rant—as ign'rant as sis—
Fer t'ain't a bit funny to see fun you miss!
But boys, as a rule
Ain't easy to fool,
They can't believe always the stuff that they hear
'Bout Santa—the chimbly—and flyin' reindeer,
So—well, I've found out—but I'm sorrl! You bet
I wisht I was ign'rant like sister is yet!

Oh, dear, I feel bad! I feel now like I do
Right after a whippin' when pa's just got through.
I'd like to punch sis! She's as happy's can be!
How can she believe it? It surely beats me
Why girls, as a rule,
Is easy to fool!
Oh, if—if I hadn't 'a' stayed wide awake
To find out if some one was playin' a fake,
Tonight I'd be thinkin' it wasn't our paws,
But really and honest a true Santa Claus!
—Blanch Fargo Griswold in Smith's.

CHRISTMAS

When strife shall cease, when sin shall be no more;
When men shall meet as kin from every shore;
When evil passion in each heart is stilled;
Then shall the Christmas message be fulfilled.
—A. H. McQuilken, in Inland Printer.

THE GREAT MEANING

Lift up your eyes to the great meaning of the day, and dare to think of your humanity as something so divinely precious that it is worthy of being an offering to God. Count it as a privilege to make your offering as complete as possible, keeping nothing back, and then go out to the pleasures and duties of your life, having been truly born anew into his divinity, as he was born into our humanity on Christmas day. — Phillips Brooks, D. D.

Look up and not down,
Look forward and not back,
Look out and not in—and
Lend a hand.

A SURPRISE PRESENT

THE Christmas gift problem was no problem to Grandmother Deane. She always gave presents. The rows of stockings, big and little, which hung by the chimney in each Deane homestead was the work of her nimble needles; and every year each one held a fresh new pair—pink and blue in the tiniest, brown or black or gray in the larger ones. Nor were these practical tokens of remembrance confined to the circle of Deanes. As Grandmother listened to her minister expounding his text on the Sunday following Christmas, it was with a serene consciousness that a pair of her good gray socks helped warm him to his subject, and that the feet of his excellent wife and of the little flock that filled the ministerial pew almost to overflowing were likewise encased in the results of her labor.

It will readily be seen that Grandmother did not wait until Christmas was only a few weeks ahead before beginning to prepare her gifts. She began with the new year, and every day except Sunday a sock or a stocking large or small drew itself, stitch by stitch, from the glancing bits of steel.

Grandmother was a sociable body, and much of her knitting was done in the family sitting room, where there was no doubt of her welcome. But sometimes she kept to the seclusion of the two rooms—the best in the house—which were her own special domain.

She was there today, winding a fresh skein of gray yarn, though not for Christmas stockings. These, a goodly pile, were finished and waiting for the morrow in the lowest drawer of her bureau.

Grandmother never wound a skein of yarn without thinking of Ned—and she thought of him many times a day besides. It was an open secret that he was her favorite among all the grandchildren, but no one knew how much she had missed him in the five years that had passed since he went out into the world to seek his fortune, as he said.

"Ned wasn't cut out for a farmer," his father had decided sensibly, so he gave him his blessing and $100 and let him go.

He had been very good about writing, and always the letters were brought over from Oliver's for Grandmother to read. They had come from California and Alaska, from Montana, and from Texas—one even from Hawaii. On this the family had gazed with feelings akin to awe.

From these letters it appeared that the wanderer, while doing fairly well, was not accumulating a fortune, but he seemed always cheery and hopeful.

A few months before he had written from Arizona. "I've struck a piece of good luck here," he said. "Not money exactly, but something better. I'll tell you all about it when I come home."

"When I come home," repeated his mother mournfully. "When will that be, I wonder?"

But Grandmother did not look mournful. Instead an odd light came into her eyes.

"Now, don't you fret, Sarah," she admonished, in her cheeriest tone.

AMERICAN SHEET AND TIN PLATE COMPANY, Frick Bldg., Pittsburgh, Pa.

"He'll be back inside a year, you see if he isn't."

"Well, I hope it will be a long way inside, then," Mrs. Oliver Deane responded with a sigh. "It seems as if I must see him right away."

When she was alone the old lady went to the bureau and took from the top drawer a little package of letters—less than a half dozen in all—addressed to herself. So worn were they with handling that they were almost ready to fall in pieces.

She read each one again, from beginning to end, then laid them back, thinking with a smile of how Ned would laugh if he could know how often she had read those hastily written letters.

Every year at Christmas time there had come a box of gifts from Ned and in it there was always something nice for Grandmother. And every year when they knew where to find him a box had gone from home, and in it there was always a pair of the soft, warm socks. This year they had not known where to send.

Since the letter from Arizona Grandmother had kept her own rooms more closely than ever before. Robert and Nancy wondered at this, but as she seemed well, and in excellent spirits, they did not worry over the matter or annoy her with questions or remonstrances.

The winding of the yarn brought Ned so strongly to Grandmother's mind for the reason that, from the time he was a little fellow until he went away, he had so often held the skein for her. When he was small she always kissed him when the task was done, and gave him a bit of candy or a few raisins. Then there came a time when it was evident that he thought both candy and kiss were superfluous, and they were withheld without remark. But by and by he would kiss her of his own free will, and say a few loving words that brought gladness to her face and a glow to her heart. The gladness and the glow came back today as she placed the skein on the chairs and began to wind.

But she did not work long. She was uneasy and could not settle herself at a task of any sort. So she moved restlessly about, doing unnecessary little things and going every few minutes to the window. Nancy found her there when she came in to sit a little before it was time to get dinner.

"Looking for snow, mother?" she cried gaily. "Well, I think it's coming. Looks as if we might have quite a storm, don't you think? We don't want anything to prevent our going to Oliver's tomorrow, do we?"

"No, indeed," Grandmother replied with energy, coming back to the fire. "I believe I am 'lotting on that tree as much as the children."

"That's a good deal," laughed Nancy. "Still they're in a fix. They can't decide whether to have their presents on the tree or in their stockings as usual.

"I don't wonder they hate to give up the stockings. How I used to enjoy hanging mine, and emptying it in the morning. Such fun! Well, I tell the children they can't eat their cake, and keep it too, and they're quite worked up over the matter."

"Yes, I know," laughed Grandmother. "They've been talking to me about it. I told 'em they'd better hang up their stockings. But they'll have something on the tree too. Sarah 'll see to that."

"Robbie was over awhile ago," said Nancy. "He says there hasn't come anything from Ned. That's odd. He always sent a box before, you know, and in good season too."

A funny little smile played abut the old lady's mouth. "Maybe there was a storm somewhere that blockaded the railroad," she responded cheerfully. "Ned will be heard from, never you fear."

"O yes, I think so. There are the children," as the outer door opened and shut noisily. A shrill cry rose on the air. "And they've waked the baby. Now they may take care of her," and Mrs. Nancy hustled away.

As the day wore on Grandmother's restlessness increased. Several times she started to wind the yarn, then impatiently pushed it aside and went to the window, sat a few moments by the fire or began to arrange the treasured ornaments on the old-fashioned what-not and mahogany table.

While engaged in this occupation for the third or fourth time she gave a sudden start, letting a china shepherdess fall to the floor where she lay, forlorn and unheeded, with a broken arm, while Grandmother stood holding to the back of a chair and straining her ears to listen.

Only a few moments—then there were steps coming to her door, then a tap and Nancy peeped in, her eyes shining, her face flushed and eager.

"Here's a gentleman asking to see you, mother," she cried. "Shall I show him in?" Then she was pushed aside and a tall, sun-burned, bearded young man strode in and took Grandmother into his strong arms.

"You know me, don't you, Grandma? Aûnt Nancy didn't at first, but I knew you would. Glad to see me, aren't you?" and he gave her a bear-like hug which made her gasp for breath.

"The folks at home seemed to be too, and they're mighty pleased with the family present I brought, I can tell you. They all think it's the best yet. You're to have a share in it—a good big one. I thought of bringing it with me, but concluded to make you wait till tomorrow. I'll bet you'll be as surprised as you were to see me."

"I shouldn't wonder," Grandmother made answer demurely. "Surprises are nice," she added with the same odd little look about the mouth.

Ned now picked her up as if she were a baby and put her into the old, well-remembered rocker. Looking around next for a seat for himself, he spied the skein of yarn.

"Hello!" he cried to it. "Shake! Haven't seen you for an age, but you look natural as life."

Some Christmas Dinners

CHRISTMAS DINNER

Turkey, gravy, dressing, mashed potatoes, sweet potatoes, potato salad, sweet and sour pickles, olives, celery, cranberry jelly, apple salad, pumpkin pie.

Cranberry Jelly—Two cups cranberries, 2 cups sugar, 3 small or 2 large apples. Cook together until apples are tender and strain through a sieve. Then add sugar and heat enough to dissolve and melt it. This can be moulded in individual moulds if desired.

Eggless Pumpkin Pie—One cup pumpkin for each pie, 1½ cups milk for each pie, ½ cup sugar for each pie, 1 tablespoon flour, just a little heaping, for each pie, or you can use ½ tablespoon cornstarch instead of flour; cinnamon to suit taste. If you use canned milk, for four pies use two cups of milk and four of water. Very desirable these hard times.

I am sending you my Christmas dinner menu, that has been carried out and will be again this year.

My plan for preparing it so I won't have much to do on Christmas day is as follows: The day before Christmas I dress my turkey the first thing and soak it in strong salt water till after dinner. Then I put it in the oven and partly roast it. I let it stand over night in the roaster, as it is aluminum, and finish roasting it the next day.

After my turkey has been dressed I make my potato salad, bake my pies, make my cranberry jelly and mould it in individual moulds. After supper is over I fix my table just ready to set, and for breakfast we use the kitchen table. The next day, or Christmas, all I have to do is to prepare both kinds of potatoes, clean my celery, make my apple salad, set my table and finish roasting my turkey, make my gravy, and it is ready to serve with no more trouble than any company dinner.—Mrs. J. C. Rogers, Fullerton.

CHRISTMAS DINNER

Oyster soup, bread sticks, salted almonds, olives, radishes, grilled sardines, potato balls and parsley butter, roast goose with cider apple sauce, glazed sweet potatoes, stewed celery or onions, endive salad, French dressing, plum pudding with sauce, red and green mints, black coffee.

Roast Goose—A green goose, from three to four months old, is a great delicacy and is cooked like a game bird, without stuffing. Season inside and out with salt and pepper, put half a white onion inside to absorb any strong taste, dredge the outside with flour and roast in a hot oven for about an hour. Serve with boiled white onions and apple sauce. For an older goose, which should not be more than a year old, use the time honored stuffing of potatoes and sage. After thoroughly cleaning and washing the bird in soda water, remove all the fat that can be reached from under the skin or inside. This may be saved and tried out to use later for goose grease.

To make the stuffing boil for 20 minutes or half an hour a half dozen potatoes; peel and mash, adding to them a tablespoon of salt, a teaspoon of pepper, a teaspoon of powdered sage and two tablespoons of white onion, minced and fried yellow in butter. Mix these ingredients lightly together, then bind with two tablespoons of melted butter. Season the goose on the inside with salt and pepper, stuff and truss. Dredge with salt and pepper and a liberal allowance of flour. Dry on a rack in a dripping pan and put into an extra hot oven to roast. So soon as it begins to color pour a pint of boiling water under the rack and begin basting the fowl. Baste and dredge with flour every 15 minutes and cook fully two hours. When well done and thoroughly browned put on a hot platter. Skim off the fat in the dripping pan, stir in a tablespoon of flour, then add a cupful of hot water or stock to make the gravy, strain and serve.

In preparing the Christmas dinner much annoyance and confusion may be avoided by making all possible preparations before hand. The goose should be dressed a couple of days before and left to hang in a cold place. The plum pudding should be made ready to be reheated when needed. A few days before Christmas place all the ingredients on the kitchen table, around which different members of the family may gather and join in the preparation, thus making it one of the main features of the merry making. One may pare and chop the apples, another crack the nuts and another chop raisins and still another cut the citron and in half an hour or so the pudding is ready for boiling. The red and green mints are home made and are prepared days before needed. The cider apple sauce is made the day before being used. The table linen, china, glassware and silver are carefully inspected, all broken or damaged pieces being replaced in time. The table decorations of holly are gathered from the mountains a week before needed and arranged at leisure.—Miss A. Butcher, Healdsburg.

CHRISTMAS DAY MENU

Cream celery soup, toasted wafers, roast turkey wtih dressing, creamed cauliflower, peas in potato cups, fruit salad, cranberry jelly, ripe olives, sweet pickles, hot buns, English plum pudding, tinted sauce; salted almonds, mixed candies, coffee, tea, sweet milk.

Cream Celery Soup—Cut up bunch celery very fine. Cover with water. Boil till all strength is out, drain off liquor, add thick cream or canned milk to make desired quantity, add butter, salt and pepper to taste. Serve with toasted wafers.

Roast Turkey with Dressing—Prepare turkey two days before needed, salt and hang in cool place. The night before Christmas day rinse off salt and stuff with the following: Stale bread crumbs, enough to nicely fill the bird, grated or rubbed very fine; one cup beef suet chopped very fine, several sprigs of parsley chopped, two stalks celery chopped, salt and pepper to taste. A few nice oysters improve it. Use no water or milk, as the chopped suet and juices from turkey in cooking will moisten the dressing sufficiently and be much lighter than when mixed soft. Fill bird and place in turkey roaster or double cooker, sew up openings, cover all over with finely chopped suet, sprinkle on salt and pepper, put no water in pan where turkey is, but in the bottom pan, place cover on tightly and it will need no basting. Set aside till morning. It should go into oven by 8:30 o'clock. Have oven quite hot at first so as to keep in juices, when slightly browned cook for three hours with slow fire, longer if not tender. Half an hour before removing turkey from oven lay link of sausage around turkey in pan, let bake crisp and brown. The two make a pleasing blend. Remove turkey and sausage to platter, garnish with sprigs of parsley, strain gravy to remove lumps, thicken and add sweet cream or canned milk. After cooking turkeys other ways for years I was taught this method by a little lady, a native of the Isle of Man, and I consider it superior to all others.

Peas in Potato Cups—Cook potatoes, season, mash fine, form into little shallow cups, brush over with cream, put in oven to slightly brown; just before serving fill with peas that have been cooked, drained and seasoned to taste.

Fruit Salad—Prepare dressing several days before needed in cool weather. Dressing: Take half cup vinegar, fill cup with water, put in pan, set on stove, add pinch salt, four tablespoons sugar, small lump butter; let boil, take two eggs, good teaspoon flour, beat light, add to the boiling mixture, beat fast to keep from lumping, boil up well and set away till needed. Thin with sweet cream or canned milk when used to thickness of good cream. Take apples, oranges, bananas, two of each, peel, slice fine, lay on lettuce leaves in dishes, sprinkle on top walnut meats chopped fine, spread on dressing and serve at once.

Cranberry Jelly—Almost cover quart cranberries with water, cook soft, run through fruit strainer, press out all pulp with spoon, return to kettle; to every cup juice add three-fourths cup sugar, cook till thick, pour into tumblers with small bottoms, a helping in each glass; let cool, run a knife blade around to remove from glass, spread on glass platter, garnish with parsley.

English Plum Pudding—Valencia raisins ¾ pound, Sultana raisins ½ pound, currants ¾ pound, sugar ½ pound, flour 6 ounces, bread crumbs 6 ounces, candied peel 6 ounces, chopped suet ¾ pound, half nutmeg, 2 apples chopped, 5 eggs, cup almonds, blanched and chopped fine; 1 tablespoon salt. Take stout cloth, dip in boiling water, rub inside with flour, put in the pudding, tie loosely, put into boiling water, boil 7 hours. This will keep indefinitely.

Tinted Sauce—One cup sugar, 3 tablespoons flour, 2 tablespoons butter, work together, pour on boiling milk (or water) to right consistency, add fruit coloring to tint a pretty pink, flavor with either lemon or vanilla.

Salted Almonds—Shell, pour on boiling water, remove skins, put in pan, set in oven, stirring often till nicely browned. Take lump butter on knife, rub over almonds, sprinkle on salt, set in oven a few seconds, set out to cool. Peanuts are nice fixed the same way, only they need no hot water to remove skins.

To prepare this menu so there will be very little to be done Christmas day, the pudding should be made several weeks before needed and hung in a cool place, though it is good when just made. The sauce can be made the day before and set on back of stove, when needed slightly warm. Prepare the turkey two days before needed, salt, hang in cool place. The night before Christmas make the dressing and stuff ready to set in oven as soon as possible next day. Make salad dressing several days before needed. Boil the celery for the soup, strain off the broth and set away to be finished up next day. Prepare fruits and vegetables ready to peel and fix next day. Prepare nuts for the fruit salad the day before and it only takes a few moments to put it together. Set the table the night before, as it takes some time, and no one will object to eating breakfast on the kitchen table. No one should be a slave over the stove on Christmas day, but should get into the season of rejoicing and help to make others happy, and remember that it is our Savior's birthday and give to him some part of the day, not forgetting the lonely and homeless ones about us.—Jessie G. Storer, Beaumont.

JANUARY PRIZE CONTEST

The January prize contest will be for candy recipes. Send in your best. $2.00 will be the first prize, $1.00, the second, and all other recipes which are published will entitle their senders to a six months' subscription to the California Cultivator. When you send in your recipe, send also name of one of your family who is now receiving the paper so his or her subscription may be extended rather than having a second copy go to your address for the six months.

Write Early

Address all letters to California Cultivator, Los Angeles, and mail them so they will reach this office by the morning of Thursday, January 14. The articles will appear in the issue of January 21.

Photo Contest

The next photo contest closes Thursday morning, December 31, and prize winners will appear in the issue of January 7.

As before, $2.00 will be given for best and $1.00 for second best photo of country life on the Pacific coast and for all retained for future engraving, six months' subscription to the Cultivator.

December Prize Winners

First prize, Jessie G. Storer, Beaumont.

Second prize, Miss A. Butcher, Healdsburg.

HAY

Under date of Dec. 12, Scott, Magner & Miller say:

Receipts of hay for the past week were 1736 tons, just about the same as the previous week, which were 1649 tons. The rains have come at the best possible time, as a great deal of the plowing and seeding has already been done, and now, with a few weeks of dry weather, everything will be seeded and the prospects for large crops at this time are good.

Receipts have consisted of the poorer and medium grades with a very few cars of first-class hay. The latter have sold to advantage. There is no change to note in the alfalfa market. Straw remains the same.

We quote the average wholesale prices on carload lots on today's market as follows:

Fancy Wheat Hay, lt. bales	11.00@12.0
No. 1 Wheat or Wheat and Oat	9.00@10.5
No. 2 Wheat or Wheat and Oat	6.00@8.5
Choice Tame Oat	10.50@12.0
Other Tame Oat	6.00@9.0
Barley	5.00@8.5
Wild Oat	6.00@8.0
Alfalfa	6.00@9.0
Stock Hay	4.50@5.0

Citrus Fruit Market

LOS ANGELES, Dec. 16, 1914.

The most satisfactory thing connected with the orange market at present is the keen demand for Californias and the premium they are commanding over any other fruit in the market. They are keeping better than oranges from any other section and commanding practically a dollar more per box. The most unfortunate feature of the market is the extreme cold just at a time when demand is great to supply holiday trade.

The strongest comment we have heard on the lemon market was by one handler of lemons, who said that it was very satisfactory in one respect, "It can't get any worse. If there is any change it must be for the better." Importations are 40 per cent greater than any preceding year, and while prices of the imported stuff are running exceedingly low, the importers are in high glee at being able to create conditions so discouraging to American production.

Shipments

Shipments of oranges from Southern California to date since November 1: 701 cars; lemons, 412; total, 1113. To same date last season: Oranges, 590; lemons, 146; total, 736. From Tulare County this season: Oranges, 3053; lemons, 74; total, 3127. Last season: Oranges, 3282; lemons, 11; total, 3293. From Butte County: Oranges, 307; last season, 260.

NEW YORK, Dec. 14.—Seventeen cars navels, one Arizona navels and three cars California lemons sold. Market easier on California navels; Arizona navels lower. Lemons steady. Weather fair.

GUARDING THE SUGAR BEET CROP

Leaf-spot, one of the most serious and widely distributed diseases of the sugar beet, can be controlled by a careful system of crop rotation and by deep fall plowing, according to recent investigations conducted by the United States department of agriculture. By reducing both the tonnage and the sugar content of the beet the leaf-spot disease is a serious menace to the profits of beet growers. In addition, the disease lessens to a very appreciable extent the feeding value of the beet tops. Sugar beets are, of course, grown primarily for the money value of the roots, but the tops are also very important as stock feed. A bad visitation of leaf-spot disease will reduce the feeding value of the tops at least 50 per cent. What this might amount to is indicated by the fact that if the disease caused an average loss of 10 per cent in the value of the crop of beet tops, the loss to the country would amount to over $300,000 a year in this one item alone. The loss in sugar would, of course, be far greater.

To control the disease the government investigators advocate first of all a proper system of crop rotation. This indeed is essential to good farming whether leaf-spot disease exists or not, but the fact that it is extremely valuable in fighting the disease is still another reason why it should receive the greatest attention from farmers. Certain pests like the fungus of the leaf-spot disease can thrive only on certain kinds of plants. When their food supply is cut off by the planting of other crops, the pests must inevitably suffer. The fungus which causes leaf-spot disease cannot, as far as scientists have been able to discover, thrive upon small grains, corn, clover, alfalfa, cowpeas, beans, and many other plants which are in other respects suitable for a rotation with sugar beets. Their use therefore will not only improve the land but go far toward eliminating the pest. In one locality, for example, a system of crop rotation is employed in which beets seldom follow beets, and here the leaf-spot disease has been stamped out to such an extent that it is no longer feared.

Where the disease has already obtained a firm footing it is recommended that as much as two years intervene between beet crops. The best results probably occur when three or even four years of other crops are provided for in the rotation. No hard and fast rotation system is laid down in the bulletin which discusses this question and which has just been published under the title of "Farmers' Bulletin 618, Leaf-Spot, A Disease of the Sugar Beet," for the authors say that the most profitable system must be worked out for each individual farm.

Deep fall plowing is another means of controlling leaf-spot. This is valuable chiefly when it is absolutely necessary to follow in infested land one crop of beets with another. Such cases occasionally arise and it will then be found that by plowing to a depth of 14 inches or so the amount of the disease in the second crop can be materially reduced. To suppose, however, that deep fall plowing will take the place of a carefully planned rotation system would be a fatal mistake.

Still a third method of controlling the disease is spraying. It has been demonstrated repeatedly that leaf-spot may be controlled almost perfectly by the proper use of Bordeaux mixture. It is a question, however, whether the remedy in some cases is not more expensive than the disease. Local conditions must determine the answer. Government investigations indicate that for effective spraying at least $9.50 must be allowed an acre. Assuming that there is a flat rate of $5 a ton for beets, the spraying must produce an increased yield of two tons in order to be profitable. As in the case of all work of this kind, moreover, the spraying must be thoroughly done to be effective. When beets are grown on a commercial basis, therefore, it is probable that the simplest and most inexpensive method of fighting leaf-spot disease is the establishment of a rotation that will not necessitate growing a crop two years in sucession in the same field; and if circumstances make this unavoidable, deep fall plowing is a most desirable precaution.

A careful farmer can also do much in the way of preventive measures. Many things contribute to the spread of the disease, such as wind, water, insects, and the passage of men and animals from diseased fields to those not yet infected. The wind, the water, and the insects are largely beyond the control of the grower, but he can in great measure at least see that neither men nor animals pass directly from an infected beet field into land that is to be used for beets the following year.

Farmers' Bulletin No. 618, "Leaf-Spot, A Disease of the Sugar Beet," will be sent free on application as long as the department's supply lasts.

CONCRETE HOT-BEDS

(Continued from Page 621)

85 or 90 degrees, planting may be safely done. Seed catalogues contain valuable information as to the length of time necessary to produce the different kinds of plants.

During the mid-day, in bright weather, the bed will become too hot and must be ventilated for a short period by raising the sash on the side away from the wind. Water the plants in the morning only and ventilate later to remove the moisture from the foliage. On winter nights it will often be necessary to cover the bed with old carpets and boards.

BEAUTIFUL CATALOG

The 1915 catalog of the Armstrong Nurseries at Ontario rather outshines all previous catalogs issued by this nursery and that is saying much for the Armstrong catalog of nursery stock has been one of the very finest issued in California, and when we say this we say practically everything that can be said for we have seen catalogs of many eastern nurseries but never have we seen any that come up to those issued by California nurserymen. Mr. Armstrong's latest catalog has 64 pages with a beautiful embossed cover. In addition to the instructive text there are hundreds of illustrations of plants, fruits and flowers. The fund of information which it contains makes it a very valuable book to add to any library. There is more of real information in it than in some books on fruit culture. No price is named so we assume a request is all that is necessary to secure it.

A NEW STORY BY KIPLING

"Swept and Garnished" is the title of the story by Rudyard Kipling which leads the fiction of the January Century. Estelle Loomis has written her impressions and emotions of "That Day in Paris." "That magic, historical Saturday, that first day of August, 1914, when I saw Paris change from its bright, high beauty—change in a single hour—to the wreck and frenzy of a cubist picture, distraught, distracted, by the ruinous threat of war." The illustrations of the January Century include pages in color by Arthur Rackham, Anna Whelan Betts ("Coming Home for Christmas"), Everett Shinn, and Frederick Dorr Steele; and four drawings by Joseph Pennell, picturing "In the Path of War."

Light, Powerful Tractor for Field Work—Power Plant for Stationary Jobs

Grinding Feed

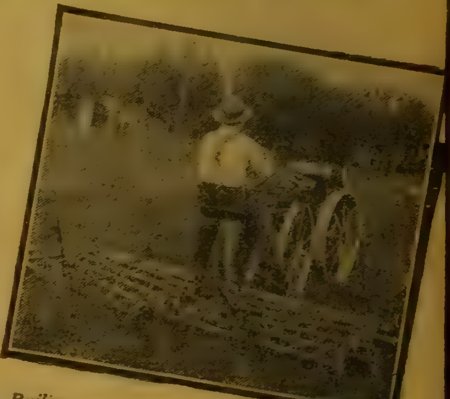
THE UNIVERSAL MOTOR CULTIVATOR is developed from the Automobile instead of the heavy Traction Engine. It works faster than horses and can work constantly.

It Cultivates corn, cotton, potatoes, kaffir, sorghum, sugar cane, federita, tobacco, tomatoes, garden truck, orchards, vineyards, etc.

It Pulls mower, rake, spike tooth harrow, drag, rollers, small disk harrow, cultivators of various kinds, weeders, etc.

It Plants corn, cotton, sorghum, clover, alfalfa, potatoes, garden truck, etc.

It Operates pump, wood saw, feed grinder, corn sheller, washing machine, churn, electric light plant, or any other light appliance of the modern farm.



Pulling Spike Tooth Harrow

Will Stand the Grind

Drop forgings of alloy steel. All crank and cam shaft bearings made of special bearing bronze. All working parts enclosed in oil-tight housings. The "V" type, two-cylinder, water-cooled motor has 3½ in. bore and 5 in. stroke, automatic plunger pump lubrication, thermosiphon radiator, Holly Carburetor, Atwater-Kent Ignition, automatic governor controlled from the seat while machine is in motion, worm drive running in oil bath, expanding ring clutch, one speed forward and reverse, gear ratio 55 to 1, weight 1,000 lbs., speed 1 to 4 miles per hour, motor develops 10 h.p. on brake test, pulling h. p. equal to team medium size horses. Prepare for cultivating season by investigating at once.

The Only Tractor That Will Cultivate

CALIFORNIA CULTIVATOR

Rural Californian combined with California Cultivator

An Illustrated Weekly Magazine, Devoted to the Rural Home and Ranch

LOS ANGELES December 24, 1914 SAN FRANCISCO

Orange Picking Season in California

This state has never shipped finer fruit than is going forward this year, and from present indications we will ship a great crop. California ships more carloads of oranges than of any other fruit.

Books

This list of helpful, instructive and interesting books is prepared by us with the purpose of enabling the Cultivator readers to supply themselves at the lowest possible cost. The great value of many of these is so well known as to need no comment from us. Some of the new books which we have added to the list this year deserve special mention. "Co-Operation in Agriculture," by G. Harold Powell, should be in the hands of every producer of farm products. "Farm Sewage," by Santee, will aid many in solving a perplexing problem. "Farm Manures," by Thorne, is decidedly valuable. We state sincerely that no orchardist can afford to get along without "The Pruning Book," by Bailey. We have had much inquiry for a book on keeping farm accounts—we can supply a good one now. The imported book, "Insecticides, Fungicides and Weedkillers," by Bourcart, is a marvel of completeness. The rapidly increasing use of gasoline engines, automobiles and tractors by the farmers has demanded reliable treatises on these subjects. "The Gasoline Engine on the Farm," by Putnam, "The Modern Gasoline Automobile," by Page, and "Traction Farming and Traction Engineering" are exceptionally complete, well illustrated and easily understood. Don't overlook the "Cement Workers' Handbook"—it's "worth its weight in gold." Every book on this list has the endorsement of the California Cultivator.

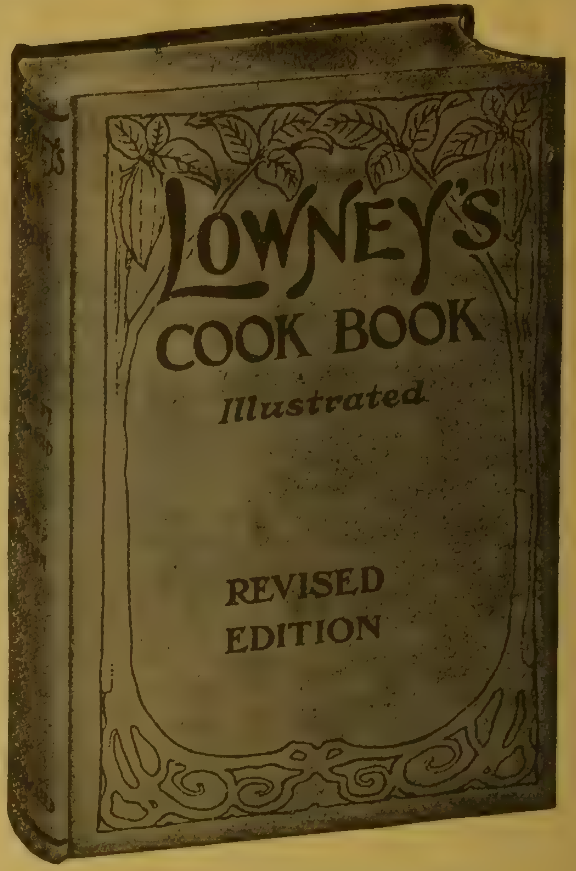
Lowney's Cook Book, The Housewife, and The Cultivator, One Year

$1.65



This Now Famous Cook Book

covers the bill-of-fare from relishes to after-dinner coffee. There are 65 different salads; 15 salad dressings; 73 soups; 50 recipes for vegetables; 91 entrees, from Aspic Jelly to Chicken Supreme; 51 sauces for meats and vegetables; 41 rules for the chafing dish. There are over 400 desserts; 84 cake recipes, not counting the fillings and frostings; over 60 recipes for invalid cookery, besides recipes for fish, meats, hot and cold desserts, bread, cake, beverages, etc.

The recipes are the latest word in scientific cooking, refined, wholesome and appetizing. There are chapters on the properties of foods; on how to market; on the theory of baking and boiling, etc., on the butler's duties and how dinners and lunches, formal and informal, should be arranged, set and served; and the woman who does her own cooking will find hundreds of simple, practical, economical dishes, which will be worth many times to her the cost of the book.

The Housewife

The Housewife is a fine, large monthly magazine edited for the woman whose first interest is the welfare of her home. Its short and serial stories are of superior merit, and are invariably cheerful and sunny. No morbid, melancholy or unwholesome stories are ever printed in The Housewife.

The Cooking Department and the Fashion Department combine luxury with economy, and are under the supervision of well-known experts. The Fancywork and Home Decoration Departments are of especially high standard, and the pages on Entertainment contain valuable and novel suggestions.

The corner devoted to "Mother's Realm" is of practical interest to those interested in the care of children and is composed of entirely common sense advice and suggestion with no untried theories.

The Housewife is finely illustrated and has excellent colored covers by well-known artists. The near-million women who read The Housewife during 1915 will find the stories of unusual interest—the kind which are sure to make a worried housekeeper forget her troubles, and to chase fatigue from the tired home manager. They will be exciting, uplifting, wholesome, and altogether human, and will be illustrated by men and women who know their business perfectly.

For a short time only

We will, on receipt of only $1.65, send the California Cultivator for one year (new or renewal), The Housewife for one year, and in a stout box, postpaid, this 421-page cook book, well printed on good paper, strongly bound in linen. Send orders with remittances to

Citrus Fruits in Japan

Carl Nichols, Who Has Secured a Fund of Information Regarding Citrus Culture in Other Countries, Has Gathered for Cultivator Readers Items of Interest as to the Extent of the Citrus Industry in Japan and the More Common Varieties Grown in That Country and Also Gives Some Points on Cultural Practice in the Orient

THE following information on citrus fruits and their culture in Japan has been obtained in part by correspondence with the American consuls at Yokahama, Kobe and Nagasaki and in part from a small book entitled "The Fruit Culture in Japan," by Tomochika Ikeda, a noted Japanese scientist and horticulturist.

Geography of Japan

Passing from the northernmost point of the Japanese isles southward to the Island of Formosa, one covers 28 degrees of latitude, or a distance of 2500 miles. Mountain chains running in a general north and south direction divide the empire lengthwise into two main divisions, that to the west or north being known as "Ura Nippon," that to the east or south, "Omote Nippon."

Climate

Ura Nippon is characterized in winter by cold north or northwest winds accompanied by snowstorms. But the cold winds from the frozen continent of Asia become much drier in passing to the opposite side of the mountain ranges. Thus in the regions of Omote Nippon rain and snow are small in amount in winter. In summer conditions are just reversed. Then we have south or southeast winds from the Pacific sweeping over the islands toward Asia. These winds are laden with moisture and much of this is discharged on striking the mountains of the Pacific belt, leaving the regions of Ura Nippon with almost rainless summers.

Citrus Growing Regions

Due to the warm ocean currents the northern limit of citrus culture is at about 37 degrees N. L. on the Pacific Coast. Near this northern limit we find growing the hardy trifoliate orange and the bitter orange known as Daidai. Farther south come the mandarins, the kinkans or kumquats and the Natsumikan (C. bigaradia var. sinense). Next come the regions where the sweet orange varieties may grow, their northern limit being about 35.5 degrees N. L. on the seacoast. Still farther south are found the pomelos, and farthest south of all are the Fingered citrons, the citron of commerce, and lemons.

The principal citrus centers are located in the northwestern part of the province of Kii, in Izumi, and in the prefectures of Wakayama, Shizuoka, Kanagawa and Yamaguchi.

Location of Groves

In the prefecture of Osaka the orange groves are situated about three miles distant from the sea and at an elevation of 2016 feet. In the province of Kii they are located from one-half to three miles from the sea at an elevation of 610 to 800 feet. The trees are often planted on steep hills in terraces, the terraces being supported by stone walls. A southerly exposure is considered best for the trees, and the best soil is a sandy loam underlaid by gravel at about three feet. The citrus fruits of Omoto Nippon are said to be much superior to those of Ura Nippon.

Effect of Latitude and Climate

As one goes southward in Japan the flavor of oranges, pomelos and mandarins becomes improved because of the greater and greater sugar content. Moreover the color deepens and the rinds become smoother and thinner. But far south in the Riukiu Isles and Formosa the acid is almost wholly replaced by sugar. Consequently the sprightly acid character of the fruit is almost lost and the quality is impaired.

CALIFORNIA-GROWN ORANGE TREE GROWN ON THE PLACE OF W. M. BRISTOL, HIGHLANDS, ON HEAVY SOIL WHICH HAS BEEN TREATED WITH SAND TO MAKE SOIL CONDITIONS MORE ACCEPTABLE TO THE FINE ROOTS OF THE ORANGE.

Extent of Citrus Industry

The only figures which I have found on the acreage of citrus groves in Japan are for the year 1903. In that year there was a total of 25,412 acres of which 14,402 acres was planted to mandarins. In 1911 there were in Japan a total of 20,145,000 citrus trees. Of these, 13,000,000 were mandarins and 1,000,000 navels.

The production of citrus fruits in 1911 amounted to 476,643,000 pounds, of which 308,798,000 pounds were mandarins and 10,611,000 pounds navels.

The exports of mandarin oranges from Japan are assuming considerable proportions. The figures for 1912 are as follows: To China, 1,578,406 pounds, $29,295; to Manchuria, 14,576,156 pounds, $251,237; to Siberia, 11,206,916 pounds, $213,250; to United States, 1,194,851 pounds, $21,526; to Canada, 3,200,916 pounds, $62,740. Total, 31,770,132 pounds, $578,351.

Common Citrus Varieties

Of the many varieties of oranges grown in Japan, the Oonshiu or Satsuma, the Hira-mikan, the Koji, the Kinkan or Kumquat and the Natsu-Mikan are the most profitable. Of the common sweet oranges, the Washington navel and Thompson's Improved navel are planted on a rather large scale.

The most popular variety of orange is the Oonshiu or Satsuma which belongs to the mandarin group. The trees grow to a height of 10 or 12 feet and cover a space of 22 feet or more in diameter. The branches put forth close to the ground, and not being pruned, the weight of the fruit causes them to lie on the ground, completely covering the trunk. The trees are extremely prolific. The fruit, which averages about 2½ inches in diameter, is picked when green and sour, even as early as the first of October. They are all off the trees by December and many are stored, being found in the market as late as the end of May. The Oonshiu orange is almost seedless, usually only about one per cent of the fruits containing seeds. The fruit is flattened, the rind peels easily and the segments part readily. The flavor is pleasant and much liked by foreigners in Japan and China.

The Hira Mikan (Kishiu Mikan, or Kino Kuni Mikan) is a somewhat smaller fruit than the Oonshiu, and though containing a few seeds, it is a very good fruit. The tree grows to a height of 30 feet, is an immense bearer and is as hardy as the Oonshiu. The Kinkan or Kumquat, known in China as the Cungnot or Golden orange, grows to a height of 16 feet and is very prolific. There are two varieties, the Marumi (round fruit) and the Nagami (long fruit. The fruit are small, containing four or five seeds, and may be eaten raw, rind and all. Their chief use, however, is for the making of preserves or for crystalized fruit. Thus treated they have long been popular in Japan and China.

Propagation of Citrus Trees

The common method of propagating citrus trees in Japan has been by grafting. Until the last few years budding has been almost unknown, but it is now beginning to be popular. The two stocks most commonly used are the Trifoliata, or native deciduous wild orange, and the Yuzu (C. medica var. acida). The former has a dwarfing effect on the graft, while the latter does not. The trifoliate orange grows to a height of 20 or 25 feet, the fruit is perfectly round, similar to a billiard ball, and is full of seeds. The leaves are trifoliate like the clover and are deciduous. The limbs are very thorny. The young seedling stocks grown from these seeds are reset each spring, and after two years are ready for grafting. Grafting should not be done until the sap begins to flow. Trees grafted on the trifoliate orange are said to be very hardy in Japan.

The principal nurseries for young citrus trees are located about 12 miles from the sea. The trees are protected in winter until the third year by wrapping them with coarse straw matting. The idea is to preserve the young growth, as there is little danger of injury to the mature branches. The Japanese see no beauty in an upright tree; rather they prefer them dwarfed and crooked. For this reason the young trees are not staked or trained. Another reason foi preferring the low tree is that the fruit can be picked without ladders, and also the moisture in the soil is thought to be retained better than when the soil is more exposed to the sun.

Cultural Operations

But little attenion is usually given to the cultivation of citrus trees in Japan. What cultivation is done is accomplished by hand, there being no horse or motor drawn machinery. The trees are often planted so close together that the branches interlock and vegetables and corn are not uncommonly planted between the trees. The groves usually appear as irregular patches on terraced hillsides.

Owing to the rainy summer in the principal citrus regions, irrigation is little practiced. The trees are sometimes watered in the dry season by carrying water to them in pails. Drainage and soil aeration are the main problems. Excellent open drainage ditches are often found and the trees are also often planted on ridges or mounds.

Night-soil, stable manures, litter and weeds are used to a considerable extent for fertilizers. Liquid manure is distributed with dippers by hand. Fish manures are occasionally used and commercial fertilizers are coming to be used to a slight extent.

Alhough lately some of the citrus growers have begun to prune their trees, the latter as well as other fruit trees are usually left unpruned. For this reason it is not uncommon to find orchards bearing a full crop only in alternate seasons.

Insects

No attention is paid to insects, except for the burning of the pupae of beetles. Scale insects are injurious in some parts and almost unknown in others.

Citrus Trees
Exclusively

All Leading Varieties

REMEMBER, MR. PLANTER

Practically anybody can grow a citrus tree, but it takes years of experience to produce a tree that will prove a money-maker when it comes into bearing. Nice-appearing nursery trees are desirable and promising, but do not always prove to be good bearing trees in the long run. Plant for profit and not for appearance only. Our trees are straight, thrifty, well rooted and have strong, full heads, but the main consideration is that: Our buds are carefully selected from heavy fruiting trees and will prove true-to-name revenue producers.

OUR TWENTY-FOUR YEARS

of experience in the growing and handling of citrus nursery trees gives the buyer the advantage of starting out RIGHT, thus avoiding disappointment at the end of four or five years' labor in bringing the young orchard into bearing.

ANOTHER POINT TO CONSIDER

Growing a good tree is only part of having it do well after planting. Many a good tree is ruined in the taking up from the nursery and shipping. We give the best of service in the proper handling and delivering of our trees.

WRITE,

'phone or call on us before buying your trees. Tell us your wants and we shall be glad to give you the benefit of our wide experience as to planting, soil conditions, fertilizers, etc.

Our illustrated new booklet on citrus culture mailed to any address upon receipt of 25 cents.

RELATIVE SIZE IN FUMIGATION

Written for the California Cultivator
By C. W. Woodworth

THE measurements now always taken in obtaining the size of fumigation tents are the distance over the top and the circumference. Most tables now in use are incorrectly calculated because equal values have been given to both dimensions.

It will be evident at once that the distance over is changed with a change either in the height or the diameter of the tree and that therefore it is the more important of the two.

The possibiliy of adding to this dimension an amount dependent on the difference between the two measurements which will indicate the proportionate size of a tent gives us a new and very convenient and accurate method of rating a tree for dosage.

This we will call the "relative size" of the tent. If the proportions of a tent remained constant the distance over could then be taken as the relative size. Since the distance around always equals or exceeds the distance over we may select as standard a tent with these two measurements equal. The amount to be added to this to allow for wider and shorter tents is one-fifth of the difference between the two measurements. Thus a tent 20x30 would have a relative size of 22 and should have a dose equal to that of a tent 22x22. It will not be necessary to explain here why one-fifth is the correct factor. (Bulletin 220, Cal. Agr. Exp. Sta. p. 5.)

The adoption of this plan of relative sizes makes it possible to present a table of dosage in an exceedingly simple form and to make the adjustments for different degrees of leakage also very easy.

DOSAGE TABLE
OUNCES OF SODIUM CYANID

Relative									Leakage		*		*		*			.25%		*			*			*	%
Size		64	61	58	56	53	50	47	44	42	40	37	35	32	30	28	26	24	22	20	18	16	15	13	11	10	ft.
40	36	32	28	24	20	18	16	14	12	10	9	8	7	6	5	4½	4	3½	3	2½	2	1¾	1½	1¼	1	¾	½	¼

Relative size equals distance over the tent plus one for each 5 ft. of difference between the measurements.

Leakage more than .25 per cent is read to the left, and, if less, to the right, one number for each .05 per cent more or less than .25 per cent. Do not fumigate trees smaller than number of feet equal to .00 of leakage. Holes produce leakage requiring the use of the next number to the left when equivalent to a triangular tear half as many inches long as relative size and quarter as wide as long.

Stronger dosage for purple scale may be read one or two numbers to the left, and weaker dosage for black scale one or two numbers to the right.

Acid corresponding with any dose is given two numbers to the left, and water three numbers to the left of the acid dose.

In the foregoing table the approximate size of the minimum dose is indicated by asterisks for .25 per cent which is printed to emphasize that this table is for that degree of leakage.

The first line of figures gives the relative sizes corresponding with the doses on the following line. The intervals range from 1—3 and the dose intervals from ¼ ounce to 4 ounce. This corresponds quite closely with previous tables and with actual practice.

The table in fact will be soon memorized. It will be noticed that the intervals of the upper line just above 10 and 15 are one and that other intervals are two except just below 35 and 40 and above 44. The doses corresponding to 10, 20, 30 and 40 are ¾, 2½, 5, 9 and with 64 is 32 ounces. The intervals in the dose line are by quarter ounces to 2, half ounces to 5, ounces to 10, two ounces to 20 and four ounces to 40.

The acid and water dose is usually calculated mentally; if to be read from the table cut a card as wide as five numbers. Held against the table the two corners will indicate cyanide and water and a line on the card may be drawn to point to the acid dose. Or prepare a card by cutting out a hole or notch wide enough to enclose five numbers and have this line to indicate acid as before.

The mental effort in calculating the relative size will not be found to be difficult and is decidedly easier than the process of adding the two figures which is now done in obtaining the distance over.

A few examples will help in understanding the process. A tent 20x30 gives a relative size of 22 (difference 10 giving 2 to add to the 20) and the dose given on the table under 22 is 3 ounces. 25x37 gives a dose a little over 27 and the dose of 28 which is 4½ ounces would be correct.

Where the leakage is not .25 per cent or other factors enter into the calculation the process is still very simple and easy. Thus with a .30 per cent 23x28 tree the dose would be 4 ounces instead of the 3½ shown in the table on a .25 per cent leakage.

Taking about the most complicated case,—a 20x26 15 per cent tent with rents amounting to 10 square inches determine the weakest dose for black scale. The size would indicate 3 ounces and the dose would have dropped to 2 ounces because of the tight tent, but for the holes which moves the number to 2½ and finally the weak dose for black scale drops it down two to 1¾ which is correct under these conditions.

If one had in this case a .30 per cent leakage the tent should not be used because the relative size is less than 30 and efficient fumigation is not to be expected.

There can be no doubt that all these factors should be taken into consideration in fumigation if the best work is to be done and this dosage table may help to remove the difficulties which have hitherto seemed to fumigators to be insurmountable.

IMPORTATION OF CITRUS NURSERY STOCK PROHIBITED

The secretary of agriculture has issued an order effective January 1, 1915, prohibiting the importation from all foreign countries of citrus nursery stock, including buds, scions and seeds, except for experimental or scientific purposes by the department of agriculture.

This action is taken to prevent the introduction into this country of citrus canker and other citrus diseases found to exist in foreign countries and liable to be introduced on nursery stock.

Yolo County claims the place of honor in the matter of almond production.

SUCCESSFUL
PLANTING
REQUIRES
EXPERT
KNOWLEDGE

WE do not mean that all successful planting must be done by experts, but that expert information and advice should govern your planting.

What are the right varieties for your particular locality; the kind that will most likely yield the greatest profit (not now, but) when they come into bearing; what are the best methods of planting, pruning, irrigating, packing, marketing, etc.? These are points that should be determined by the experience of others.

ROEDING'S
Free Advisory Service

Our Mr. Geo. C. Roeding has had over 30 years' experience in this state and is probably the best known nurseryman on the Coast. His experience covers not only the growing of nursery stock, but all other points up to the disposal of the fruit. The benefit of this experience is yours for the asking.

When you buy trees from us we take a live interest in you and your orchard; we want to see every R. & W. planted orchard yield a profit to its owner and become a lasting advertisement for this Company. We will be glad to give you full information about our advisory service, free of charge or obligation, if you will call or write.

CITRUS
Trees

We have for this season's planting an exceptionally fine collection of all the leading varieties of

ORANGES
LEMONS
POMELOS
AVOCADOS

Our stock is guaranteed true to name, is grown under ideal soil and climatic conditions by experts, and is dug and packed so as to reach you in A1 condition. No matter how large an orchard you may be figuring on setting out, you will do well to get our prices and suggestions.

Olives and DECIDUOUS FRUITS

We also have a magnificent assortment of olives in all the best varieties, and can supply your wants complete in nursery stock of nearly every kind—apples, pears, plums, peaches, prunes, grapes, as well as ornamental and evergreen trees, vines, plants, etc.

WRITE US TODAY

Send us your list of probable requirements for prices and suggestions and ask for information about our free advisory service.

SUCCESSFUL ORANGE SHIPPING

Ten per cent of the Florida orange crop, it is esimated, decays before it reaches the consumer. Since the average crop is 4,000,000 to 5,000,000 boxes, this means an annual loss of at least half a million dollars, according to the most recent investigations, the results of which are published in Bulletin 63 of the United States department of agriculture dealing with the successful shipping of oranges from Florida. To the individual grower such a percentage may mean all the difference between profit and loss for his year's work, but, as the bulletin points out, the matter is largely in his own hands. Careful picking and packing will reduce the loss enormously.

To prove this, experiments were carried on for a period of two years with oranges shipped from Florida to Washington and held there under open market conditions for a period of three weeks. Each shipment consisted of six boxes, two handled entirely under the direction of the investigators, two picked in the regular commercial way but graded and packed with special care, and two taken at random from the ordinary run of shipments. The following table shows the results of this investigation, the different percentages of decay at the end of the three weeks being particularly impressive.

Blue-mold decay in oranges carefully handled and commercially handled on arrival in Washington and after holding for three weeks; summary of the results of the two season's work, 1910-11 and 1911-12:

Time of examination.	Careful pick and pack.	Commercial pick and careful pack.	Commercial pick and pack.
	%	%	%
On arrival	.06	2.0	5.5
After 1 week	1.0	3.3	8.8
After 2 weeks	1.5	4.5	11.8
After 3 weeks	2.1	5.8	14.2

From 79 comparable shipments made in 1910-11 and 65 comparable shipments made in 1911-12.

In securing these results no methods beyond the reach of commercial growers were employed. Indeed a number of commercial houses secured results almost as satisfactory as the investigators and one packing house reduced the average decay in its shipments from 15.8 per cent in 1910-11 to 4.1 in 1911-12.

The secret, the investigators find, lies in the prevention of blue-mold. "An injured orange," says the bulletin, "whether grown in California or in Florida, will decay whenever the conditions for the development of blue-mold are favorable. A sound orange in good healthy condition, whether grown in California or in Florida, is able to resist blue-mold decay."

Every orange man knows blue-mold when he sees it. It is caused by the growth of a minute organism within the tissues of the fruit, but this organism cannot penetrate the sound living tissue of a well-grown fruit. Before the disease can do harm, therefore, there must be a break or an abrasion of some kind in the skin of the orange. This is why full value for the crop can be obtained only by the most scrupulous care in picking and packing. Heat and moisture help the mold to grow in injured fruit; sound fruit will withstand the most unfavorable weather conditions.

Like many men, the Florida orange suffers from a thin skin. It is easily cut by the clippers in picking, by gravel, twigs, thorns, and especially by the long stems of other oranges, in field handling, and in packing is easily bruised by rough washing and handling. Many growers do not realize how delicate their crop is and say nothing while their workmen pick their pockets in sheer ignorant carelessness. Even the scratch of a finger nail will leave an opening for the blue-mold and all pickers and packers should be forced to wear gloves.

There are a hundred other ways, discussed in detail in the bulletin, by which efficient supervision can minimize danger to the fruit. Clippers with rounded or blunted points should be supplied the pickers and inspected frequently by the foreman to prevent their being used when dull or loose at the joint. The picking sacks should be designed with partially closed mouths so that the oranges must be carefully placed and not tossed in the sacks. They should also be emptied from the bottom in order to prevent bruises when the field boxes are filled. The boxes should be smaller because small boxes can be handled more easily and therefore with less roughness than the ones now in use. The fruit should not be permitted to project unprotected above the tops of the field boxes and more care should be exercised in transporting the boxes to the packing house. At present they frequently received a severe jolting in transit and the driver is too often permitted to make himself comfortable on top of the fruit.

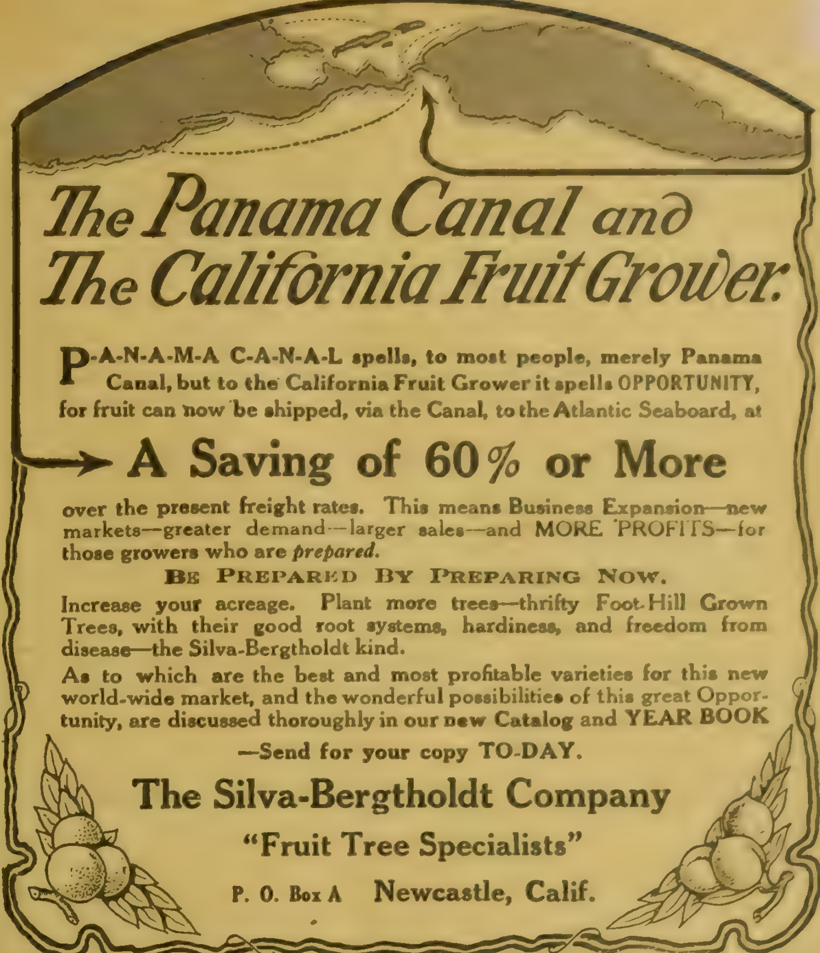
In the packing house similar precautions are essential. The machinery must be as simple as possible, even if simplicity involves an apparent waste of space, and so designed that the oranges are not subjected to drops at any stage. Twigs, splinters, and rubbish of any kind, should be guarded against in every possible way.

The importance of such care is more thoroughly realized than in former years. In particular, growers are discovering that the practice of paying pickers by the box leads to hasty careless work. When the picking crews are paid by the day instead and in addition subjected to energetic and efficient supervision, the percentage of injured fruit, and the consequent percentage of decay is much reduced. A capable foreman is, in fact, of the utmost importance. He should not be expected to pick himself but should be left free to watch the work of others. A really efficient man will save far more oranges than he could possibly pick.

Although strict adherence to the recommendations contained in the bulletin will greatly reduce the quantity of bruised and cut fruit that finds its way into the packed boxes, under the best of circumstances there will always be a certain amount that is susceptible to the ravages of the blue-mold. Moist heat is peculiarly favorable to the spread of the disease; therefore the fruit should never be packed while moist, and an artificial drier in which a warm air blast is circulated around the fruit seems to be a necessity if washing is resorted to. Washing, however, should be omitted whenever the fruit can be marketed without it for it is a common means of infection, the water in the tanks carring the blue-mold spore and the washing machinery tending to bruise the fruit.

"Curing" also, the investigators find to be unwise, in fact the shipping experiments showed that no advantage was gained by it. Where the fresh fruit is firmly and properly placed in the box, it is no more likely to make a "slack pack" than the cured. On the other hand the delay, especially in warm, humid weather, greatly increases the chances for the infection of bruises and cuts and thus facilitates decay before shipment and in transit.

For after all the important thing is the packing of undamaged fruit. If this is successfully accomplished the loss from decay can be minimized under the most unfavorable conditions. Precooling for example, while a valuable precaution, cannot be relied upon to offset the damage done by mechanical injuries. It is interesting to note that the investigators, from whose researches Bulletin 63 has been compiled, not only furnish mathematical proof of the importance of careful handling but report that this importance is now more fully realized than ever before by growers and packers.



The Panama Canal and The California Fruit Grower.

P-A-N-A-M-A C-A-N-A-L spells, to most people, merely Panama Canal, but to the California Fruit Grower it spells OPPORTUNITY, for fruit can now be shipped, via the Canal, to the Atlantic Seaboard, at

A Saving of 60% or More

over the present freight rates. This means Business Expansion—new markets—greater demand—larger sales—and MORE PROFITS—for those growers who are *prepared.*

SPECIAL SALE of Farm Implements

Startling reductions in many lines. We are preparing to move from one of our warehouses into a new one and find hundreds of items that we wish to close out rather than move. Prices are sharply reduced for quick sales.

PLOWS, HARROWS, LAND ROLLERS, RIDGERS, DRILLS, TRANSPLANTERS, CULTIVATORS, MOWERS, RAKES, FEED CUTTERS, CREAM SEPARATORS, BARN EQUIPMENT, GAS ENGINES, SCRAPERS, VEHICLES, WAGONS, TRUCKS, GARDEN TOOLS, MILK CANS, PAILS, ETC.

We can only give you a rough idea of the principal items. Not all styles or sizes are included, but plenty for you to pick from. You can save money on almost everything you need—but remember, the quantities are limited. Make up a list of what you need and write or call and see us.

Please remember that we are not moving our office and salesrooms—merely one of our warehouses. You will still find us at the same old stand.

Deciduous Fruits

APPLE CULTURE

By W. H. Lawrence, Arizona Agricultural Experiment Station.

IN planning a commercial apple orchard one should be careful to consider the extent to which the apple industry will develop in the immediate neighborhood; the probable magnitude of the industry throughout the entire section tributary to the markets in which he expects to sell his fruit; and the distance from a good local market and the condition of the roads during the hauling season.

Climate

Throughout portions of the state where water is available for irrigation at elevations exceeding 2500 to 3000 feet, may be found the more perfectly developed, highly colored fruit. Throughout the warmer portions of the state few varieties succeed well, the fruit produced being small, of poor color and extremely low quality. It is hardly advisable to attempt to grow apples, for other than home use or local consumption, in the warmer portions of Arizona. Commercial production of the apple may be undertaken, however, throughout those areas in which the climatic and other conditions are more favorable.

Soil

The apple will grow in almost any soil. The soil best suited, however, is a deep, porous type, that will absorb and hold a large per cent of moisture. The soil should be four to six feet in depth, and should be underlaid with a well drained subsoil. When dry farmed or where there is water for supplemental irrigation, the soil should be uniform, deep, of good physical structure, high water absorbing power and retentive of moisture. Any locality in which the water will collect and stand is undesirable. A still less desirable condition is one in which the water table rises to within a foot or so of the surface during the winter, and subsides slowly during the growing period. A covering of irrigating sediments on the soil is adverse to the growth and development of fruit trees. Such deposits usually prevent the penetration of water and air during irrigation, influencing the vitality of the trees.

Alkali

Apple trees are only weakly resistant to alkali salts, especially black alkali (sodium carbonate). Should alkali appear after the trees have been planted, the ground should be well cultivated to prevent the rise of salts as much as possible. Cover crops should also be grown that will fill the ground quickly with roots to a depth of several feet; and large volumes of water applied to wash the salts down into the subsoil. In case of the presence of black alkali, gypsum should be added at the rate of two pounds for every pound of sodium carbonate that chemical analysis reveals present in the soil.

Elevation

In selecting land for planting, high ground is preferable, where good air and water drainage are assured. The elevation of the orchard with respect to the adjoining lands should be such as to insure drainage from the area.

Exposure

In the cooler portions of the state the exposure may slope gently in any direction. Rather abrupt south, or southwest, exposures are to be avoided. In the warmer localities, however, the exposure should be a north one, the slope being gradual and not too abrupt, to admit of ease in caring for the orchard during irrigation, spraying, thinning and picking fruit. North exposures are desirable because of less absorption of heat by the soil and slower evaporation of water from the surface. The loss of humus and nitrogen is therefore somewhat less than from warmer exposures; and trees come into bloom later, remaining in bloom for a longer period of time. This permits more abundant pollination and setting of fruit.

Preparing the Land

To prepare virgin soil, care should be taken to destroy the surface rubbish, and to dig out all roots to a depth of a foot below the surface. The soil should be tilled until it is in the best physical condition. Should it need humus or nitrogen, or both, it is then advisable to grow leguminous crops, for one year at least. In setting an apple orchard, one is establishing plants whose roots will occupy the entire soil to a depth of several feet for many years, making it quite impossible to improve the condition of the soil with ease and at low cost, at a depth greater than a few inches below the surface.

Varieties

With our meager knowledge of the adaptability of different varieties to local conditions, the selection of varieties for planting is rather difficult. It is only possible to suggest a number of varieties that probably will prove suitable for various sections. Objectionable characters, such as shedding the fruit throughout the entire season, shy bearing, or failing to produce fruit of commercial size, may, nevertheless develop. The Bismarck, Duchess of Oldenburg, Golden Russet, Gravenstein, Red Astrachan, Rhode Island Greening, White Winter Pearmain, and all varieties of crab apples, may prove to be fairly good producers at elevations below 3000 feet. At most

Plant Pears for profit. California Bartlett ripen earlier than Eastern and Northwestern grown pears. During their season they monopolize the markets of the United States and Canada.

Silva-Bergtholdt's
FOOT-HILL GROWN PEAR TREES
are practically immune from blight and have strong, hardy root systems; the foundation of all successful trees.

We have a fine stock of Bartlett, Comice, Winter Nelis, Anjou and other varieties. Our buds are cut from selected parent trees.

THE SILVA-BERGTHOLDT CO.
"Fruit Tree Specialists"
P. O. Box A Newcastle, Cal.

elevations exceeding 3000 feet may be found the Arkansas Black, Stayman's Winesap, Jonathan, Missouri Pippin, Delicious and Spitzenberg, as well as a large number of the more common apples of the red or striped varieties. Among the yellow varieties, the White Winter Pearmain, the Yellow Newtown and Grimes' Golden are apparently the leading sorts.

In this list only a few of the varieties that have proven to be good sellers on the general apple markets have been named.

Home Orchard

Selecting varieties for the home orchard is an easy task. One should select several, securing the most desirable sorts that mature in succession during the entire season. The winter or long keeping sorts should predominate, in order to have a sufficient supply to store for use until the trees are again producing fruit large enough to cook.

Should space for planting limit the number of trees, the entire assortment of varieties desired may be grown by top working each tree to two or more varieties. The Early Harvest, Red June, Red Astrachan, Gravenstein, Rhode Island Greening, Jonathan, Missouri Pippin, Delicious, White Winter Pearmain, Stayman's Winesap and Grimes' Golden make a good selection for the home orchard.

Commercial Orchard

In developing a commercial orchard, one should confine his plantings to a few of the very best varieties. These should produce long keeping, ready-selling fruit, that may be placed on the market in good condition during a long period of time.

The number of varieties to plant in a commercial orchard varies with conditions. In general, a five-acre orchard, unless the fruit is to be sold on a local market, should contain only two or three varieties. A ten-acre tract, or a still larger area, may contain up to seven or eight varieties. To ship long distances and compete with the same varieties from other apple-growing districts, the volume offered for sale must be large, the package neat and attractive, and the pack equal to the competing product. Volume usually makes it possible to establish trade, and for this reason the greater the quantity, the greater the possibility of securing reasonable returns.

Varieties in the orchard should be planted in two, four or six rows, etc., in order to facilitate spraying, thinning and packing the fruit.

Ordering Nursery Stock

Having decided which varieties to plant, it is quite essential to place the order with some reliable person or firm, who will fill the order as given. To plant and care for an orchard until it comes into bearing, only to find the varieties other than those you intended to grow, causes much financial loss, as well as much delay in bringing the orchard into bearing, since it then becomes necessary to top work the trees to desirable sorts.

Such a loss may be prevented by personally propagating the stock, or by arranging with some reliable person to do the work for you. Apple trees of all sorts show great variations in character, and it is necessary to make a study of individual trees, so that propagating stock may be selected to the best advantage. Propagate only from healthy specimens of a variety true to type, producing heavy yields of fruit, with characteristic physical qualities also true to type.

Budded stock is preferable to grafted stock, since it is less apt to be infested with crown gall and hairy root.

It is generally conceded that nursery stock will give the best satisfaction when secured from a section having about the same climatic conditions as those under which the orchard is being planted. The method of handling the nursery stock from the time it is dug until it is set in the orchard is of still greater importance. Unless dug properly, packed and shipped correctly, heeled in or planted at once and otherwise given the care necessary to keep the stock in healthy condition, the results during the first year, and possibly thereafter, will not be very encouraging.

Kind of Trees for Planting

In ordering nursery stock, it is best to specify one-year-old stock. Such stock usually has two or three-year-old roots, generally three years of age, with a top one year old, grown from the bud or scion. Trees of this age are preferable, a majority of them being free from branches. They should measure about five-eighths of an inch in diameter at the collar, stand four to six feet high, and have good strong

IRRIGATION PRACTICE IN THE SACRAMENTO VALLEY

By W. S. Guilford, Before State Fruit Growers' Convention at Davis

IN discussing irrigation practice in the Sacramento Valley I shall attempt to cover some of the points that seem to me to have been the cause of success or failure, both with new settlers who are buying subdivision acreages and so-called "old timers" who are abandoning extensive grain farming wholly or in part for more intensive operations under irrigation.

Such propositions as the duty of water, cost of pumping plants, comparative value of plants of different kinds, and many other highly important factors have been or are being worked out by investigators with time and appliances for such careful and scientific studies. Many of the things I will touch upon are so simple and self-evident that it would seem that no thinking person would ever do them wrong, yet they are repeatedly the cause of inconvenience and loss in every irrigated section in the United States.

IRRIGATION AS PRACTICED IN SALT RIVER VALLEY, ARIZONA
Courtesy Phoenix Board of Trade

The first consideration in connection with a prospective irrigated farm is:

Choice of the Land

Factors which govern the value of land for an irrigated farm are character of soil, contour, irrigation facilities and transportation.

The soil should be selected with reference to the crops to be grown. In almost every part of California where land is for sale it is possible to find land similar to that which it might be thought desirable to purchase, growing profitable intensive crops. If the principal crop to be grown by a prospective settler is prunes, for instance, and in the neighborhood of a piece of land he has selected prunes are being successfully grown on similar land, he can be reasonably sure of his choice so far as crop adaptation is concerned. In general a rich soil, well drained and free from hardpan and alkali should be chosen.

Then there is the cost of leveling to consider, and land with an even slope free from deep depressions that will have to be filled and not so level that it has to be moved long distances in order to make the water run, can often be leveled for irrigation for $20 to $30 less per acre than some other land.

The kind of an irrigation system from which water is to be secured, whether from gravity flow or pumping, is a consideration that affects future profits. If water is to come from wells the assurance of a supply is of importance, also the cost of pumping and maintenance: The same applies to water from a gravity project. A stream must furnish water throughout the season to be of the greatest value.

Many of the products from an irrigated farm are bulky, and transportation from the place where they are grown to the railroad or boat and the cost of sending them to market must be figured for a term of years. It is possible for the cost of hauling heavy crops to a loading point to be a large percentage of the total cost of production.

Unless the prospective purchaser is familiar with soil, crop adaptation, the labor and cost of preparing land for irrigation and the cost of water under different systems, he should get advice on these points from some one who does, for a place well selected and well bought is well started toward success, while some otherwise good prospective producers of crops are so handicapped by wrong selection of land that it takes years for them to surmount the handicap—if they are ever able to. The average person does not hesitate to pay for medical or legal advice. Why should he hesitate to obtain the best possible counsel on a matter that concerns his future success in so vital a matter as the selection of land for a farming business?

The Object of Irrigation

Irrigation is practiced to supply to the soil in the area in which roots take plant food a sufficient supply of moisture for the best possible development of the plant. Many different methods of applying water are necessary to accomplish this result with the different kinds of soil. This is what makes every sucessful irrigator a student and is the reason why an ingenious, thinking person gets better results than one who simply "irrigates" without knowing what the water is doing.

There is no better way to learn what the condition of the soil is than to dig holes in it, before and after irrigation, to find out how dry the soil is and whether or not the moisture has penetrated to the proper depth.

On one large deciduous orchard in Glenn County we have just dug good sized holes in every part where there are apt to be different soil conditions. This was done to find out how fast the moisture is drying out, how well the mulch is holding the moisture and how far down the tree roots are. The trees were planted last year. We found that wherever we were able to disk the land and get a good mulch before the soil became hard and dry there was plenty of moisture; in one place an irrigation now will connect the lower moisture up to where the greatest root development is (two to three feet) before it gets so low that the tree will suffer. To irrigate now and carry these few trees through without a check is worth many times the cost of digging all of the holes.

While the water is running the depth of penetration can be determined with a sharp pointed steel rod, and every irrigator should use one of these frequently. It can be shoved into the ground easily to the depth that the moisture has penetrated.

Until we have more definite data as to the moisture requirements of plants, and some easy method by which the irrigator can test the soil for moisture content, the condition of the plant and the soil as observed by the operator is one of the best guides as to when irrigation is required. It is difficult to tell just what to look out for in the plant when it begins to need moisture, but the careful, observing man readily learns to recognize the signs of need or distress. For instance, the foliage on a potato plant which is getting dry becomes a dark, almost black, green which can be distinguished almost as far as the plant can be seen. It is very different from the normal, healthy green of a plant well supplied with moisture, and different again from the sickly light yellow that is produced by excessive irrigation.

In order to be of the greatest possible benefit to the tree or plant irrigated, moisture must penetrate as deeply into the soil as the roots can feed to advantage. Water penetrates open, sandy soil readily, and the biggest problem in this kind of land is to get it over the surface without wasting too much through the subsoil. Checks or furrows must be short and a big head of water used.

Where the land is heavy, with a large percentage of clay and silt, as it is in a great part of the Sacramento Valley, the difficulty is to get enough penetration. When the soil is thoroughly dried out to a considerable depth, as it was last year, a small stream of water must be run for a long time before it penetrates three to five feet. Two years ago at the Monroeville orchard of the Sacramento River near St. John in Glenn County, the soil was thoroughly dried out to a depth of 15 feet and the rains of the winter of 1912-1913 penetrated only two or three feet and did not connect the lower with the upper moisture. During the season of 1913 we were compelled to run small streams along the tree rows for 10 days in order to get a three to five foot penetration as indicated by the steel rod when shoved into the furrow, but irrigators were required to get this penetration and so control the streams that very little was wasted at the end of the 660 foot rows.

In our orange grove at Orland, which is on very heavy clay land, in fact I do not know of any heavier soil in the Valley, it had been the practice for years whenever it was irrigated at all to flood the land. After government water was available three or four years ago it was flooded every 10 days or two weeks and cultivated between irrigations. This practice was rapidly breaking down the granular structure of the soil and burning out the humus and vegetable matter, and following the first irrigation after we purchased the place in June, 1912, I could find no place in the orchard where it was possible to stick a spade —or even to dig without a pick—over nine inches into the soil. For the next irrigation we plowed four furrows between the rows, made head ditches and controlled the water in the furrows through lath boxes. The soil was so hard that it was almost impossible to plow the furrows, it being necessary to go through two and three times with the plow before they could be opened up enough to run water. Too large a stream was turned in for the first irrigation, and the bottoms of the furrows silted over so that the water ran through the 400 foot rows almost as well as though the furrows had been cemented. They were furrowed out again, a little deeper this time, and a small stream turned in that required 24 to 48 hours to get through the rows, soaking in pretty well as it passed along. Such an extreme measure as this is seldom necessary, but it certainly was in this case, and we kept a small stream running for four or five day periods, cultivating and furrowing out between times nearly all of the summer season of 1912, and irrigated a great deal in the same way during the dry winter of 1912-13. The problem of getting moisture into the soil for the use of the root systems of these trees involved supplying vegetable matter to the soil in every available form, straw, manure, prunings and weeds. Now we are just getting a good enough soil condition to grow an abundant crop of wild oats, burr clover, alfilaria and other plants, and we have allowed this vegetation to become quite mature before plowing it under this year. If we can get a satisfactory seed bed soon we will probably plant alfalfa and let it stand two or three years before plowing the orchard again to further open up the soil and subsoil and improve its physical condition. Deep furrows will be plowed out so that irrigation water can be supplied. I do not believe this practice would be advisable unless an ample supply of irrigation water was available, but fortunately there is no shortage of water in the Sacramento Valley.

(Continued on Page 664.)

$200 to $300 an Acre
From a Walnut Grove

in full bearing is not unusual and many groves are producing even more. There's money in Walnuts.

MAYETTE! True Wiltz Strain! For productiveness, freedom from bught, and wonderful Quality, the Wiltz strain of Walnuts has no equal in any other of the standard varieties. Late Bloomer.

FRANQUETTE! True Vrooman Strain! Next to the Wiltz Mayette, the best Walnut for Northern and Central California. Late Bloomer.

Our Scions of Franquette and Wiltz Mayette, cut by R. Wiltz, a pioneer Walnut grower, are not only absolutely true to the strain, but are from selected trees. They are the best.

ORANGE
LEMON
GRAPE FRUIT
LIME
TREES

We are digging our citrus stock now and the trees are splendid. We never handled or grew finer trees. They are of large caliper, well branched and absolutely free of all insect or fungus pests. We have about 75,000 trees to dispose of during the coming season which accounts for the low prices at which we are offering them: Oranges, Navel and Valencias; Lemons, Eureka; Grape Fruit; Limes. These are not "cheap" trees. They are first class in every particular but we are overstocked. The trees can be seen any time at our Nursery Salesyard back of the big store.

We also carry a full line of ornamentals, parking and street trees, roses and fruit trees. We invite your inspection.

The Lawn and Flower Garden

THE CALIFORNIA GARDEN

Written for California Cultivator

By Ernest Braunton

MUCH has been written of the value of the common earthworms, "angleworms," or "fishworms," to agriculture, but in the garden they are a pest to be discouraged. All the good they do in aeration or ventilation of the soil or pulverization of it through eating and after voiding, is more than offset by the harm they do in eating bulbs and other underground vegetation. Many times have I found a fat earthworm coiled about a gladiolus bulb, eating away the root crown, and in some cases this was all gone and the entire value of the bulb thereby destroyed. Only when the soil is dry will the villains retreat to greater depths.

For these worms have a mouth, lips, crop, gizzard and many other organs common to higher animals. And while they neither see nor hear they have a slight sense of smell and a well-marked taste. They live largely on decayed vegetation and drag leaves and parts of leaves into their burrows, but their range of food is large and green leaves are eaten as well. They have been watched while eating fresh leaves of cabbage, turnips, horseradish, mint, celery, carrot and a long list of common plants. Food dragged into their burrows is moistened with a secreted fluid which has been thought to hasten their decay so that they are partially digested before eating, much as some carnivorous plants such as sun-dews, fly-catchers, and others in turn consume worms and insects. Much might be written of these earthly inhabitants, but the one point for us to consider is: Are they beneficial to the garden they inhabit? After years of study of the subject I would prefer, in the interests of gardening, to harden my heart and kill every living thing found in the soil, for all are harmful, and if the earthworm has a redeeming economic characteristic it is cannibalism, and I would destroy him for that, too.

Division of Bulbs

A question very commonly asked is: "How often shall I take up and divide my bulbs?" It is more often asked about amaryllis bulbs than any others, for the average home gardener tackles everythig else without compunction, but from the dormancy of amaryllis and being out of season with the great majority of bulbs apparently constitutes an exception, yet facts do not bear out the assumption. Divide all bulbs once in three years, also all roots and plants easily capable of division unless large clumps are desired. Even then it is best to dig some out of the center of each clump and refill the hole with new, rich soil. Many bulbs are best dug up each year and divided before replanting.

Asafoetida a Safeguard

It is claimed that asafoetida will keep away quite a variety of insects, especially the beetles that infest melon and cucumber plants, and we believe it; it would keep us away as well. Put about an ounce into hot water until all is dissolved, then add water to make two gallons. Sprinkle this over the vines in the evening or very early morning. The bugs will have business elsewhere that claims their immediate attention.

Stir Soil Now

If you are contemplating new planting the present is an excellent time for soil preparation for later planting. Too many urge one to plant, plant, plant. When soil is cold and all plant life inactive, why plant? Deciduous fruit trees are now dormant, and they are far hardier than citrus trees or the general run of plants we use, none of which will compare with apple and pear trees for hardiness, then why rush planting with soil illy prepared. If soil has been stirred deeply and well-aired, if well-fertilized, no serious objection to present planting is urged. Yet now is the time to stir soil deeply and thoroughly, to properly mix in fertilizer, not merely turn it under. Then, when later planted areas so treated will respond with an early vigorous spring growth that will amply pay and satisfy for the careful preparation given. After planting it is difficult to reach the soil beneath tree or shrub.

Reckless Use of Fertilizers

It is well to remember that when local temperatures are at lowest ebb or during the coldest weather of our so-called winter, soil bacteria cannot act, being dormant, and therefore usual methods of applying fertilizers are without immediate results. Nitrate of soda will alone yield an immediate return, and this brings us but one element of plant food, though the most essential and most costly, viz., nitrogen. Heavy mulches of stable manure blanket the soil and keep it cold and inactive. Their chief food value lies in the ammonia therein contained, and if hard rains come this is washed away to other lands, into the gutters, or leaches down in loose soils to a depth where it is unavailable to a major part of common garden plants. Give the subject of fertilization a little scientific study; it may save you from some profitless expenditures.

Do Not Trim Acacias

Avoid trimming acacias at this time unless necessary for safety of trees or convenience of pedestrians on streets, for you will cut away much of the spring crop of blossoms. A careful glance at any acacia now will reveal the buds present on all branches and bring you to a realization of the loss of flowers you will sustain through pruning at present. Pruning for flower crop should be done immediately after the close of the blooming season.

Be Patient

Just now we are having the coldest weather of the year, and too much must not be expected of plant life, for at no time is it so inactive or nearly dormant as at present. As warmer weather comes all vegetation will the better respond for this period of rest and the aggregate results will amply satisfy if no other check is present except a comparatively low temperature. A few hardy plants, as a few hardy people, are stimulated by cold weather, but too many of our plants are native to warmer climes and cannot put on warmer clothes or take other necessary precautions to be able to withstand cold snaps, so do not be impatient, the worst is with us and the best is yet to come.

Treatment of Bulbs

Now that Dutch bulbs and others of like season and similar requirements are growing, it is pertinent to ask if they are receiving sufficient food. Unless the soil is rich it may be as well to feed them, and this is best done with commercial fertilizers or liquid manure. Applications of stable manures, unless most thoroughly rotted, are to be discouraged, and in any event will not bring results quickly enough to do much good to the present crop. So that commercial fertilizers are better used in solution than dry unless very evenly distributed and well mixed with the top soil. Nitrate of soda, used alone, will hardly do, for it is productive of foliage rather than of flowers. A fertilizer carrying a good balance of nitrogen, phosphoric acid and potash is needed. If the soil is rich enough an application of air-slaked lime, well mixed with the top soil, will suffice.

Spring Pruning of Roses

If roses have not yet been pruned this season do not attempt it now, for it is three months too late for fall pruning. Cutting back now will bring only tender shoots and buds as spoils for sharp frosts. Better now to leave bushes unpruned until the coldest weather is over and then get a glorious spring crop of flowers. The writer year for spring crop, but severely prunes the majority before October, to get winter flowers. This treatment is best for the warmer sections. aims to leave part of his roses each Where the temperature runs down to freezing point every night for weeks there are a few good winter roses, the good old-fashioned Laurette being the best of well-known sorts. In the cold sections severely prune in very early spring or after heavy frosts are past or unlikely to continue long.

Small Fruits Vegetables

EXPERIMENTS WITH UDO

FOR persons who like novelty an interesting experiment is offered by the new Japanese vegetable, udo. Nurserymen have grown the udo under the name of Aralia cordata for ornamental purposes, for twenty years or more, but as a vegetable it is still comparatively unknown. On rich soil it grows to a height of 10 feet or more, producing a very ornamental mass of large green leaves and, in the late summer, flower clusters, sometimes three feet in length. In appearance it is much like a larger variety of the spikenard or pretty morel, a native of our woodlands.

The blanched shoots of the udo have a characteristic flavor. Properly prepared they are delicious—or so the author of Bulletin 84, just published by the United States department of agriculture under the title of "Experiments with Udo, the New Japanese Vegetable," has found them. The plant requires little care and with the same space devoted to it, yields approximately the same amount of food for the table as asparagus and is ready for use at about the same time in the spring. After the first frost it dies down each autumn to come up again in the spring, much as asparagus and rhubarb do. A patch of it can be forced each spring for at least six years and probably much longer. The flowers attract bees and flies in such numbers that a field of it is usually humming with insects. As a honey plant, therefore, the udo deserves the attention of beekeepers.

Udo growing is not yet sufficiently general in this country for the most inexpensive methods of cultivating to have been worked out, and conditions in America are so different from those in Japan that little benefit can be derived from the experience of Oriental growers. It is, however, reasonable to assume that the cultivation of the udo presents few difficulties. It is adapted to a wide range of climate, as is shown by the fact that it grows all over Japan, but no part of Japan suffers from drouth. In this country the udo has done best in moist regions, in particular in New England, the Atlantic states as far south as the Carolinas, in the rainy region of Puget Sound, and in the trucking sections of California.

Where greenhouses or cold frames are available, the seed should be planted in March or April—one-fourth of an inch deep in soil that consists of equal parts of loam, mold and sand. As soon as the plants are three or four inches high, they can be planted out in the ground or potted and set out later. Thereafter the udo needs little attention. Its roots spread with extraordinary rapidity through loose rich soil—udo is not recommended for poor, dry land—and the crowns soon become at least a foot across. Three and a half or four feet is therefore not too great a distance to allow between plants.

Perhaps the greatest difficulty connected with the cultivation of the udo is the blanching of the shoots. It is these that are regarded as the real delicacy, for the flavor of the stems when green has a certain rankness which is unpleasant to most palates. Various methods of blanching the early shoots have therefore been experimented with. In California excellent results have been obtained by mounding up the earth in the early spring over each plant much as is done with asparagus. Elsewhere, however, the late frosts make the soil too cold and the shoots are slow in coming through.

Another method is to put a large drain tile, with one end closed, over each hill before the spring growth starts. The shoots which come up inside the tile are well blanched but they show a tendancy to produce a number of unopened leafstalks which take away from the robust growth of the shoots. To obviate this, casks or boxes filled with light material such as sand or sifted coal ashes have been tried with considerable success. In any case great care must be taken not to permit the shoots to break through into the sunlight. If they succeed in this, they at once become green and their flavor rank. Shoots can be cut when only six inches long, but it is better to let them grow to 12 or 18 inches.

In the cooking of udo there is still abundant room for innovators. In all experiments, however, one thing must be remembered. When raw, the stems contain a resinous substance which gives them a decided, and to many persons unpleasant, taste of pine. It is, however, easy to eliminate this by soaking thin slices of the stems in ice-cold water for an hour or two, or by boiling them in two or three waters, as is often done with strong-flavored vegetables. The author of the bulletin, who has been experimenting for eight years with udo on his Maryland farm, suggests the three following recipes as samples of what can be done with the vegetable:

Udo On Toast.

Peel the shoots and drop them into cold water. Cut them into four-inch lengths. Boil them in salt water for 10 minutes, then change the water, adding a fresh quantity of salted water and boiling until quite soft. Prepare a white sauce, such as is used for cauliflower or asparagus, put the udo in it, and allow it to simmer until thoroughly soft. Serve on toast in the usual way. If there is too much of the pine flavor, as there may be if the shoots are not thoroughly blanched, a second change of water will remedy this.

Udo Salad.

Peel the shoots, cut them into three-inch lengths, and then split them into thin shavings, letting these fall into ice cold water as they are made. Allow them to soak in the water for a half hour or an hour, so as to remove the resinous material in them. Serve with a French dressing of pepper, salt, oil and vinegar. Do not dress the shavings until just before serving, as they become stringy on standing in oil.

Udo Soup.

Remove the skin from the shoots. Cut in pieces one-half inch long and wash thoroughly in cold water. Cook until tender and mash through a colander. Add a pint and a half of milk, one-half pint of cream, two tablespoons of butter, and one tablespoon of flour, mixing the flour and butter until smooth. Season with pepper and salt. (Recipe for one bunch of udo; enough for five persons.)

Just how popular the udo will become, is not predicted. It is desirable, however, that amateurs experiment with it for it is not at all impossible that udo prove a valuable addition to our table vegetables.

POTATO EELWORM

Quarantine Order No. 6 was duly issued by the state of California against the potato eelworm, Heterodera radicicola, and at the time of its issuance was deemed necessary for the protetion of the state. On December 23, 1911, Quarantine Order No. 7 was declared revoking Order No. 6, and containing certain qualifications or conditions. As occasion no longer exists for the qualifiations or conditions of Quarantine Order No. 7 it is hereby revoked.

It is urged, however, that all potatoes, whether home grown or from any other state, be carefully inspected and that any infested with eelworm be rigorously excluded.—A. J. Cook, State Commissioner of Horticulture.

Wilson's Quality Trees

Are in heavy demand this season. The selection of buds from established bearing orchards, careful selection of seed, causing healthy, vigorous growth—THE REASON. The following letter is one out of many thousands we have received in the past:

Grass Valley, Calif., Dec. 7th, 1914.
Fresno Nursery Co., Inc., Fresno, Calif.
Dear Sirs: In January, 1912, I received from your nursery 210 walnut trees of three varieties, which I am pleased to say have yielded since the first year of planting, each variety bearing a few nuts of excellent quality and TRUE-TO-NAME. I never lost one single tree of your shipment. The 600 pear trees received at the same time as the walnuts are also very satisfactory. My trees have done so well that the local paper has given considerable space about the vigorous growth of my orchard.
Very truly, (Signed) GORDON S. MORGAN.

That tells the story.—Prospective Planters, give us an opportunity of starting you right by supplying strictly first class nursery stock. Send us a list of your requirements for quotations. Our large 52 Page Book describes all varieties of Fruit Trees, Grape Vines, Ornamental Trees and Shrubs, Palms, Roses, etc. We send this book free upon request. Remember we specialize on DECIDUOUS FRUIT TREES, CITRUS TREES, OLIVE TREES, FIG TREES, GRAPE VINES, and Hardy Ornamentals. Write us if you want the best that money will buy. Address

Economics on the Farm

COOPERATIVE MARKETING OF AGRICULTURAL PRODUCTS

THE following article is summarized from one appearing in the Monthly Bulletin of Economics and Social Intelligence.

The problem of improving the economic and social position of the farmer is probably, at the present moment, the most discussed question in the United States. The American farmer is dissatisfied; and, as he represents the most important industry and the most numerous class of workers in the country, he is able, naturally, to insist that his grievance shall be heard.

Briefly, his grievance is that the prices which he receives for his products are too low, and that, in view of the prices ultimately paid by the consumer, he is being unfairly squeezed by the middlemen. It is contended that the farmer, who works laboriously and bears all the risk of production, receives as his reward, only from 30 per cent to one-half of the retail price received for his products. The remainder is absorbed by the middlemen who bear little or no risk, and who—though this is implied rather than stated—do not work hard.

THERE IS MORE POWER FARMING IN CALIFORNIA THAN EVER BEFORE

The figures quoted in the article in question prove that the complaint of the American farmers is not without foundation.

An inquiry made in 1910, in 78 cities throughout the country, revealed the fact that the dairy farmer received a bare 50 per cent of the retail price for milk. The cost of transport averaged 7 per cent of that price, and the remaining 43 per cent went almost wholly to the retailer. According to the findings of the industrial commission, which reported in 1901, the farmer received 55 per cent of the consumer's price for poultry; 69 per cent for eggs; 55.6 per cent for apples, and only 20.3 per cent for oranges.

The secretary of agriculture, from the results of a number of official investigations, draws the general conclusion that "the distribution of farm products is considerably involved, and burdened with costly features," and it is generally admitted that there is much overlapping and waste between the producer and the consumer.

One of the remedies most frequently proposed is the formation of farmers' cooperative selling associations, and a very large number of such associations already exist. In California, among the citrus fruit growers, they reach their most highly developed form, and are strong selling organizations with effective control over the produce of an entire district and a powerful influence on prices. The typical California selling association consists of as many as 100 local associations, closely federated into a single selling agency. Co-operative selling has also achieved considerable success in the New England and Atlantic states, especially among growers of small fruits and vegetables. In 1912, one association—the Eastern Shore of Virginia Produce Exchange—shipped 4600 cars of potatoes, 230 cars of strawberries, 150 cars of cabbage and 100 cars of onions. It had at that time more than 2500 members, all under contract to sell exclusively through the exchange.

As a rule, however, farmers' selling associations are on a smaller scale and are less strictly organized. Occasionally an association does no more than pool the produce grown by

its members and make a collective bargain with the local buyer. At the next stage the association owns a central packing-house, assembles the produce, and offers it to competing markets in carload lots. By shipping in bulk a very large saving is usually effected in cost of transport.

That a cooperative association may be directly successful in raising prices is proved by the history of the Southern Rice Growers' Association. In January, 1911, when this association began operations, rough rice was selling at $2.30 a barrel, and the whole industry was disorganized. The association at once showed its strength by buying 250,000 barrels of rice and exporting it to Europe, bearing a loss of $65,000 on the transaction. Both growers and merchants acquired confidence in the association as the one body able to maintain steady prices, and in its second season the Southern Rice Growers' Association marketed the whole of the rice produced by its members at $3.60 a barrel.

The cooperative movement among American farmers is receiving sympathy and encouragement from many sides. The United States department of agriculture has undertaken to investigate existing conditions and to publish accurate information. A special division has been created under the title of the office of market investigations, and the whole process of marketing farm produce of every kind is being studied step by step from the producer to the consumer.

General Agriculture

OPERATING THE TRACTOR

FROM The Modern Gas Tractor, Its Construction and Operation, we quote a few paragraphs touching upon operating the tractor.

Advice on Tractor Operation

The operation of a gas tractor will not prove difficult to an engineer familiar with steam tractor operation or to one who is familiar with automobile driving. The main point to remember is that the tractor may be stopped immediately by disengaging the master clutch and applying the brakes. One who has never controlled a heavy machine of this character will first have to become familiar with operation of the steering mechanism. An automobile is provided with a steering gear that is quick to act and one and a half turns of the steering wheel is all that is necessary to turn the wheels from one extreme position to the other. This sensitiveness is necessary on account of the high speed automobiles are capable of. With a tractor conditions are different, the speed is low and considerable weight is supported by the front wheels. This means that a greater number of turns of the hand wheel will be required to steer a tractor than will be needed to direct a motor car. This is necessary because less effort is required from the operator on account of the lower ratio on the worm reduction gearing, and as the tractor is traveling at a comparatively low speed the operator has ample time to turn the hand wheel any number of times that may be desired to insure movement of the front wheels. Most tractors are provided with a crank or small handle extending from the rim of the steering wheel so that this member may be revolved at a higher rate of speed than would be possible if it were grasped around the rim.

The tractor operator should always be careful when operating on highways to avoid hollows or soft ground and mudholes should always be passed by making a detour instead of steering the heavy machine recklessly through them. Care should be taken in passing over bridges to make sure that these are of ample strength as many flimsily built wooden structures have failed under the great weight of the tractor for which they were never designed. If the tractor becomes mired and the differential lock is not available pieces of plant, brush, straw or anything that will help traction may be put under the driving wheels. If one wheel is on dry land a tractor will often free itself provided that the differential gear is temporarily put out of commission. This can easily be done on most tractors by bolting a lever carried by the revolving axle shaft to the wheel hub that normally revolves free around it when the differential gear is in operation. This insures that both wheels will turn with the axle and the wheel that is on dry land will provide traction enough to move the machine under these conditions. If the differential gear were in operation the traction member that was in the mudhole and which had the least adhesion with the ground would just spin around, whereas the other member would remain stationary.

On two and three speed tractors the operator should always use that ratio best suited for the work the tractor is doing. In getting from place to place over the roads and for hauling light loads the highest speed of a three-speed tractor, which is about six miles an hour, can be used. For hauling heavier loads over the highways the medium speed, which is about three and one-half or four miles per hour, will give the best results. For drawbar work where considerable power is needed the lowest gear ratio, which is seldom over two miles per hour, should be used. The tractor should not be operated on the low gear except when conditions demand it and if the load is light it is preferable to run on one of the higher gears and throttle the engine down than it is to run on a low gear ratio and run the engine at full speed.

When operating a tractor over hard roads, especially those of the macadamized variety, the operator owes it to the public to remove the grouters, traction points or mud lugs from the rear wheels and run on the smooth steel tire. The use of grouters cuts up a road too much, whereas running with steel tires offers enough adhesion to secure traction on a hard road and at the same time the road is benefitted by the rolling action of the large wheels, rather than being cut up as is the case when the projections ordinarily fitted to increase traction in the field are fitted.

HOME MADE GAS

Use an oil drum or any solid tank of at least 25-gallon capacity. In one end of this bore three holes; one for hand hole and to pour in gasoline, one for a bicycle valve to pump in air and one for the gas discharge pipe. Set the drum in the ground full depth and fill in the bottom for about four inches with hog hair and place wire screen over this and the gas plant is complete.

To operate. Pour in about one quart of gasoline (more or less as your needs will determine) each day and pump up with bicycle pump to give pressure. The warmth of the ground evaporates the gasoline. This will supply clean gas to be used for both heating and lighting and may be piped any distance.—H. E. Van Horn, Kerman.

USES OF TUNGSTEN

Tungsten is used principally as an alloy of high-speed steel—that is, steel used in making tools used in metal-turning lathes running at high speed—to which it imparts the property of holding temper at higher temperature than carbon steels will, according to the United States Geological Survey. The new well-known ductile tungsten is used for incandescent lamps, which are fast displacing carbon lamps. Recently greatly improved lamps, in which the wire is wound in helices and in which the globes are filled with nitrogen, have produced a close approach to white light. These lamps are furnished in candle powers up to 2,000. Ductile tungsten is practically insoluble in all the common acids; its melting point is higher than that of any other metal, its tensile strength exceeds that of iron and nickel, it is paramagnetic, it can be drawn to smaller sizes than any other metal (0.0002 inch in diameter), and its specific gravity is 70 per cent higher than that of lead.

PLANT APRICOTS
Consider these facts—
Market—The entire world.
Demand—Steadily Increasing.
Supply—Grown commercially only in California.
Profit—From $175 to $300 an acre.
Weigh the evidence, and your own good judgment will tell you to plant
SILVA-BERGTHOLDT'S
Foot-Hill Grown
Apricot Trees
Prized for their thrift, hardiness, good root systems and freedom from disease.
Though we have an extra fine block of Blenheims, Royal, Newcastle Early, Moorpark, Routier's Peach, and Tilton on Apricot, Peach and Myrobolan Root, a shortage of good stock is expected this year, so order now and get choice trees.

THE FARMING INTEREST

The interest in farming is on the increase, has been for some years, but never has it engaged the serious attention of so many of the great men of affairs as it does today. At the annual dinner of the leading club in Sacramento recently, at which were gathered the big men of affairs of the city and adjacent territory, one of the chief topics of conversation was farming. Wheat, hogs and reclamation, the problems of settlers, the coloring and ripening of oranges; these and many kindred subjects were discussed. None better than these bankers and business men realize that the future of the cities and the state depend on the upbuilding and prosperity of farms and farmers.

THE STATE BEAUTIFUL

A speaker at the recent nurserymen's convention at San Diego urged the delegates attending to go to their homes and talk and work for the alley beautiful, the park beautiful, the clubhouse and surroundings beautiful, the church and home beautiful, the state and the country beautiful. If there was ever inducement for California to dress up it is this year. The rains have come and the ground is fitted for starting poppy seeds and every other kind of wild flower which add so much to our beauty. Let this be encouraged just so far as possible and let every countryside, no matter how remote, take up with the spirit of 1915 and get busy in preparation for our visitors.

NATIONAL ORANGE SHOW

February 17-24 has been set apart for the coming National Orange Show at San Bernardino. A strong committee of boosters and workers has been chosen and the greatest exhibit of citrus interests ever staged has been planned for exposition year. The citrus industry of California has grown beyond the dream of the most optimistic, and it is well that it should have a special exposition such as has been held in San Bernardino for several years. The management says that indications are the coming show will be the greatest ever. Far away Butte County has already announced her intention of entering the competition.

NEXT CONVENTION

The 46th State Fruit Growers' Convention will be held at Stanford University according to present announcement the last week in July, but a private letter from Dr. Cook intimates that the convention may be held over until some later date. The next American Pomological meeting is at Berkeley in September, and it is possible that the state convention may be delayed until about that time. Dr. Cook writes that he anticipates half-fare will be granted on all railroads. The woman's department which proved so attractive at the Los Angeles convention will be continued and will be in charge of Miss Clark of the state university. One of the principal features to be discussed at this convention, it is announced, will be pear blight. It is also announced that one-half day of this convention will be given up to a ride through the Santa Clara Valley.

SECOND LARGEST

The University of California is the second in size of all the American universities. Its registration at the end of November was 8,481, or 1,215 more than a year ago at the same date. Columbia University in New York alone exceeds it in number of registrations, it having 10,961 students. But more than 5,000 of Columbia's total are summer session students, a much greater number than that of California, so that California's total of full-course students is practically the same as Columbia's. The next university following California is Pennsylvania, with something over 7,000. Then comes Michigan with 6,000, New York, Illinois, Ohio, Wisconsin and Cornell following in order named. In the list of universities in the United States Harvard is 11, Yale 14, Stanford 19, while Princeton is 21, the latter having a total attendance of 1,665. The registration in January is expected to greatly increase California's attendance.

A GREAT SEASON

Certainly Santa Claus never put a greater present in the stocking of California than he has this year; the last rain has soaked the soil from Shasta to San Diego, and it with other conditions make up a most happy Christmas and New Years season. The prune and the hop growers of the north and the cotton growers of the southern end of the state and incidentally all the rest of us feel somewhat the financial depression which has prevailed since the opening of hostilities in Europe. Notwithstanding this and a few other discouraging features the new year will open with large promise. For one reason it is "1915," which has been a word to conjure with for the past five years. The canal is completed. The two great expositions are almost ready to swing their gates, and the Golden Gate, the Silver Gate and the harbor newly created at Los Angeles are all open to the traffic of South America and all the world. With the markets of the world asking for the California products a responsibility is laid at our door and the best of it is we manifest a disposition to accept the responsibility.

Let it be a year for the production of staples which will be needed for feeding the hungry.

CENTRALIZING INDUSTRY

Question has been asked as to the poultry packing industry being centralized as has the meat packing industry. At first thought one will say "Decidedly not," for it is on so different a plane; the small poultryman or farmer can handle his poultry in a way to appeal to the market which he has to serve. But note we say "can handle." Does he as a rule? Does he put up his poultry in an attractive manner or is it simply killed and delivered to the market in any slipshod way? We believe that the poultry people are studying their own industry. It may be they will perfect a system whereby the producers will have full control of it, but if the consumer finds that he can secure the finest goods by dealing with the packer who has studied conditions and fattens and packs in a way which attracts these buyers, while the producers do not, then the industry will surely be controlled by the big packer. The suggestion has been made to control this tendency toward centralizing by bringing communities together in construction of small packing plants. In communities where there is a sufficiently high intelligence to permit of full cooperation it is possible such an experiment might prove successful.

AN ALFALFA HAY LESSON

J. H. Hale, the great peach grower of Georgia and Connecticut, who took part in the last Fruit Growers' Convention at Los Angeles, related a story that has a moral for every California farmer. When he was a very young man he heard of a farmer in western New York who had become very wealthy. In order to find out how this man had done it he made a trip to see him. He was cordially received and shown all over a well managed, well kept farm, but the owner was at a loss to tell him any particular thing that was the secret. One thing happened, however, which Mr. Hale concluded later had much to do with his success. A load of clover hay was seen coming up the road and as it neared the farmyard gate the successful farmer hailed the driver and bought the hay. His wife took occasion to comment thus: "Now, what did you want to buy that hay for? The barn is full now. You seem to think you have to buy all of the hay in the country." Turning to Mr. Hale the farmer said: "Young man, I make it a practice never to sell a load of hay off this farm and I never allow a load to pass by on the road."

Any man in California who has a good alfalfa farm can get rich if he will follow the example of this New York man; if he will feed all the hay he grows to good livestock and buy and feed on his farm all that is offered at a reasonable price. Conservative livestock farming always pays; some other kinds do not merit this statement.

Agricultural Notes

New granges were organized throughout the United States last year to the number of 411.

The timber industry represents 37 per cent of the annual production of wealth in British Columbia.

The several bureaus and divisions of the United States department of agriculture received appropriations from congress amounting to $19,865,832 during the fiscal year ending January 30, 1915.

Those familiar with the eastern mistletoe only have no idea of the great losses due to this parasite in the forests of the west, where it counts next to fire and insects in the amount of damage done.

Of two million sheep annually grazed in the state of Utah, more than a million are on the national forests, or, including lambs which are fattening for market on the forests ranges, over a million and three-quarters.

In parts of the west where trees are scarce, sage brush is used for fuel. In Nevada the large main stems are trimmed by Indians at $3.00 a cord and delivered to the user at about $6.50. Sage brush burns rapidly and is rather dirty, but produces good heat.

A contract has recently been let for the construction of a postoffice tube line in London six and one-half miles long, extending between the eastern district postoffice in Whitechapel and the Paddington district postoffice, and making connections with a number of other postoffices.

The "health exhibit" cars of the Louisiana state board of health are being taken around the country by the railways of the southern states without charge; and the cars have recently visited New Orleans, Richmond, Jacksonville, Atlanta, Macon and a dozen other cities.

In the annual report to congress of the interstate commerce commission the fact is stated that the commission has received 58 applications for release from the requirements of clause forbidding the ownership of water lines by railroads, and investigations of these cases are well under way.

Palm kernels, secured from the oil palm of West Africa, are used in Germany as a source of oil and feeding cake. The oil obtained from them is of a white or pale yellow color and possesses a pleasant taste. It is used for the same purposes as coconut oil, viz., the manufacture of soap and candles, and the preparation of various edible fats. These products are manufactured on a large scale in Germany and exported largely to Great Britain. The meal which is left after the extraction of the oil from the kernels is of value as a cattle food, the whole of which is practically consumed in Germany itself.

The National Labor Exchange has been formed as a result of a conference early this month in Kansas City under the auspices of the United States commission of industrial relation. It is a cooperative organization to act as a clearing house for harvest hands and is to be governed by representatives of the state improvement and agricultural boards of Missouri, Kansas, Oklahoma, Nebraska, North and South Dakota, Iowa, Minnesota, Montana and probably Wyoming. Ultimately it is planned that the organization will be nation wide in scope, to systematize the distribution of farm labor.

Agricultural News Notes of the Pacific Coast

Northern California

The Shasta County dairy industry is increasing rapidly.

The prune crop of northern California is valued at about $2,000,000.

Live Oak, Sutter County, is planning for extensive planting of rice.

Election of officers of the Yolo County farm bureau was held on Tuesday.

Yuba City farmers will plant carob, or St. John's bread, trees to a limited extent.

The growing of broom corn has proven profitable at Los Molinos, Tehama County.

Vacaville is exhibiting Washington Navel oranges weighing a pound and a quarter apiece.

Siskiyou County estimates it will send to San Francisco this year over 700 cars of fat cattle.

Fishermen are finding great sport and some profit in capturing salmon along the Feather River.

The first annual meeting of the Humboldt County farm bureau is to be held at Eureka, January 7.

The Farmers' Protective League is moving for correction of certain weak points in the initiative law.

Grass Valley farmers are bringing in large numbers of stock from the Salt Lake section for fattening.

The northern end of the state claims nearly 50 per cent of all the apples trees planted in California.

Some farmers in Siskiyou County have had good returns from corn, averaging close to 102 bushels to the acre.

Horticultural Commissioner Hecke of Yolo County recently made addresses before farm centers in Placer County.

Thirteen hundred hogs were driven to the Reno (Nevada) market from Alturas, Modoc County, during the past season.

Fruit growers of Sutter County have had difficulty in marketing some fruits during the past season because of over-irrigation.

Yuba and Sutter Counties are uniting in the effort to encourage water transportation on the Feather River for their main products.

The Hayward farm bureau center held a meeting last week and furthered the movement for the organization of a boys' agricultural club in that section.

The United States forest service will unite with supervisors of Trinity County in the building of one of the state's finest highways, costing approximately $1,000,000. An effort will be made to induce Humboldt County to unite in this work and extend the road through to the coast.

The report of the state dairy bureau shows a shrinkage in financial returns to dairymen of California during 1914 over those of 1913. Returns from last year aggregated $33,941,493. For 1913 they were $34,050,552. It appears that Stanislaus County held the honor of first place for a short time, having been passed this year by Imperial County.

Central California

Lindsay shipped 102 cars of oranges in one day.

Stanislaus County is now taking up the matter of growing rice.

Watsonville, Santa Cruz County, is to install a free public market.

Dairymen at Hollister, San Benito County, are greatly increasing their stock.

San Jose is giving especial attention to the manual arts and agricultural departments of its public schools.

The Lodi chamber of commerce has changed its name to Chamber of Commerce of the North San Joaquin.

The Denair center of the Stanislaus farm bureau met last week and counted the names of members, finding 300 listed.

Buyers of Tulare County oranges have been so anxious to secure stock that they have agreed to advance money to shippers.

Canada has received oranges purchased from Tulare County at good prices and has sent hearty commendation for quality of fruit.

Kerman, Fresno County, has a hog ranch where "chemically pure mush-fed hogs" are to be produced. Even the bath water is to be sterilized.

Largely because of successful cooperative dairy and creamery methods in Tulare County the industry has been greatly increased in that section.

Kerman, Fresno County, will hold its annual farmers' institute January 11 and 12. More attention than usual will be paid to poultry in this year's program.

At a recent meeting of directors of the Apple Annual, held in San Francisco last October, it was announced that the deficit on the show will amount to $2000.

The Spreckels Sugar Company is offering to purchase sugar beets on a flat rate of $5.50 per ton. The company hopes to contract for 1200 or 1500 acres in the south San Joaquin section.

During the month of November 482 cows were tested by the Stanislaus County Cow Testing Association. The highest testing cow showed a total for the 30 days of 2463 pounds of milk and 78.6 pounds of butter fat.

A farm bureau center has been established at Bakersfield, Kern County. Meetings will be held the fourth Wednesday of each month. Action was also taken towards the organization of a farmers' exchange at Bakersfield.

A number of ranchers in the section about Terra Bella, in Tulare County, have made experimental plantings of sugar cane. Cuttings were obtained from Glendale, Arizona. The Visalia mill of the San Joaquin Sugar Company will install crushing machinery to care for the cane.

The committee of the California Development Board appointed to consider plans for colonizing Belgian farmers in California has suggested extending the scope of the original idea to include colonizing of Americans who wish to go on the farm. Some serious and thoughtful work is being done in connection with the plan.

Southern California

Heber recently shipped five carloads of fancy long staple cotton.

Thermal, Riverside County, expects to ship 100 cars of onions the coming season.

Large plantings of cantaloupes are planned for next season in the Heber district.

Corona expects a big orange crop this season. It is now estimated at about 1600 cars.

It is rumored that an auto stage line will be established between San Diego and Los Angeles.

Citrus growers have their frost pots and fuel in readiness to light at a moment's notice of frost danger.

The Ventura County farm bureau has established several experimental plots in different sections of the county.

The Los Alamitos Sugar Company gave its annual barbecue to beet growers and employes at Seal Beach on December 15.

A reduction of six to seven dollars per ton in ocean freight rates on lima beans from California to New York by way of the canal has gone into effect.

Between 600 and 700 cars of walnuts have already been shipped from Southern California. About 40 per cent of this amount is from Orange County.

Manager Thorpe of the California Walnut Growers' Association is making a trip through the east and middle west, visiting jobbers who buy California walnuts.

The Northern San Diego County chamber of commerce held its third meeting at Oceanside, December 12. The discussion was principally on water rights of the district represented.

Growers of onions in the Lompoc district of Ventura County are hustling to get their crop out of the ground and on to the market to take advantage of the last week's rise in prices.

Two new steamship lines have recently entered trade between New York and California points. The freight business is so largely increased that lines formerly operating were unable to handle all of it.

To solve the aphis problem of the Imperial Valley it is announced that an entomologist from the state university will come to the valley early in January to study the situation and make recommendations for control of the pest.

The Piru Citrus Association is the newest growers' association in Ventura County. David Felsenthal was elected president of the association, C. S. Johnson, secretary and manager; F. S. Chapman, U. F. Del Valle, A. N. Davidson and John Alcock, directors.

Ventura County has a new board of forestry. The members are: Mrs. L. B. Hogue, first district; F. A. Snyder, second district; E. P. Foster, third district; A. C. Hardison, fourth district; T. A. Rice, fifth district. The board has power to appoint a county forester who will work under salary.

The Coast

Utah has taken steps to reduce the coyote pest.

Inspectors have condemned several shipments of apples made to Ogden, Utah.

Washington has sown a greater wheat crop than ever before in its history.

The Washington agricultural college has just installed a field dairy specialist.

Adams County, Washington, is prosecuting a vigorous rabbit-killing campaign.

The annual state poultry show of Utah will be held at Salt Lake City, January 11-16.

A stock-judging contest for boys was held at Chehalis, Washington, last Thursday.

Utah sugar beet factories have ruled that next year's prices will be the same as last year.

The annual wheat convention of the Washington state college will be held at Pullman, Washington, January 5, 6, 7.

Orchardists met recently at Wenatchee, Washington, and discussed the necessity for lower transportation rates.

The Oregon agricultural college at Corvallis is building a large structure which will be devoted to home economics.

A shipment of 200 heifers made to Bozeman, Montana, from eastern states was released after 17 days in quarantine.

This is the week of the Northwest Live Stock Show at Lewiston, Idaho. Preparations have been made for the greatest ever.

Apple growers of the northwest find the market somewhat improved and many shipments have been made within the last few weeks.

The State Seed Growers' Association, convened at Twin Falls, Idaho, gave one entire day to the discussion of producing better seed potatoes.

Fruit growers of the Northwestern states have received during the past season $1,128,000 as a result of the operations of the North Pacific Fruit Distributors.

Oregon has changed its quarantine regulations so as to harmonize with the national regulations, in that portions of the state may be quarantined instead of the entire state.

At the fruit growers' convention held at Wenatchee, Washington, last week discussion was held as to the advisability of merging many cooperative fruit associations of the Northwest.

Orchardists at Spokane, Washington, have worked up quite an extensive business this year in shipping to exclusive markets exceptionally fine stocks of Rome Beauty apples for the holiday trade.

The annual session of the Oregon Wool Growers' Association was held last week at Pendleton. Officers were elected as follows: President, Fred W. Falconer of Enterprise; vice-president, W. B. Barrett of Heppner; secretary-treasurer, John C. Hoke of Medical Springs.

"I Saved $400.00 on My House and Barn by Buying Building Material from the Whiting-Mead Commercial Co."

This is an actual statement made by one of our customers. You can do the same. You can save from $25.00 to $40.00 on every hundred dollars' worth of building material you need by buying direct from us. We cut out the dealer's profit. If you are going to build or repair a house, barn or auto shed—study these prices carefully and be sure to send coupon below for our Big Free Catalog.

THIS SPECIAL STEEL ENAMEL BATHTUB
A wonderful bargain! Made of finest galvanized 24-gauge steel. Outside finished with a rich sky-blue enamel, bronze trimmed. Price only $8.00

Others larger in size at $8.50, $9, $10. Just the thing for your house.

Low Down Enamel Steel Toilet Combination $12.50
Complete to floor—wonderful value.
Low Down Vitreous China Closet Combination $16.00
Special value—worth $22.50
Big values in High Tank Toilet Combinations $10.00
Complete to floor—a bargain.
Special Bankrupt Stock of Kitchen Sinks. All sizes—up from $1.00
Best Quality Porcelain Lavatories; every one guaranteed—$10 down to $3.75
Standard House Paints. High grade—24 colors—per gal. $1.50
Black Graphite Roof Paint—per gal. 50c
Standard Roof Paints—red, green, gray—per gal. 85c
Shingle Stain, made from pure ground colors—per gal. 50c
Everything in Paints, Wall Tints, Brushes, etc., at big savings to you. We ship direct.
Roofing Paper—1-ply, plain or sanded—per roll of 108 sq. ft. $1.25
—2-ply only $1.50 per roll. Cement and nails ready to lay included in above price. Send for free sample.

Wire Fencing at Half Price—per rod 35c
Extra heavy Field Wire, 6-inch galvanized mesh. Perfect condition; 55 inches high, 20 rods to the roll. This is just about half price. Don't pass up this big opportunity. Send us your order, your money back if you are not satisfied.

Galvanized Barb Wire—per roll of 80 rods $1.75
Our Light Wire Special, slightly water stained in shipping otherwise in perfect condition.
Special heavy galvanized "Waukegan" barb wire, 80 rods to reel, weighing 100 to 115 lbs., only $2.75 per 100. Going fast! Don't miss this opportunity.

Lowest price yet on Corrugated Galvanized Iron—per hundred square feet $3.55
Look at this! Corrugated galvanized iron, 2-inch corrugations, from 6 ft. to 8 ft. long. This is in perfect condition and won't last long at this special price.

Three-ply Moisture-Proof Fiber Wall Board—per thousand square feet $19.00
Laid in asphalt or cream white fiber—your choice of either. This is a genuine $30.00 value for $19.00. Wall Board does not crack, simple to apply. Takes the place of lath and plaster. Very economical. Used in any building.

Special—Nails—in 100-lb. kegs—per keg $2.20
This is an unequaled price for 20, 30, 40, 50 and 60 penny common nails. We also carry all sizes and finishes at $2.20 per 100 lbs. base.

LUMBER, SASH AND DOORS — Lowest Prices on Rough and Finished Lumber
2-inch Redwood as low as $12.00 per 1000. 1 in. x 6 in., 8 in. and 10 in. length, 8 to 18 ft., going at $15.00 per 1000. 8 ft. x 12 ft., galvanized all-metal frame skylights glazed with ribbed glass, suitable for hot-house, roofs, etc., crated, $12.00 each.
Two-light double hung windows 1⅜ in. thick, best quality American window glass, all sizes 60c
No. 1 Colonial Door Selected Kiln-Dried Oregon Pine — all stock sizes—$1.50 up.

Second Hand Building Material At Wreckage Prices!
Carried only by Whiting Wrecking Co.
You can buy anything in the Building Material line second-hand, at one-half to two-thirds less than the price of new material. We do 95 per cent of all the wrecking done in Southern California.
Wonderful bargains! Be sure to write for estimates on anything in second-hand Building Material to the

FEEDING SILAGE

Written for the California Cultivator
By Sacramento Valley Contributor

SILAGE made from Indian corn constitutes a large percent of the silage made and fed in the United States, although alfalfa, clover, soy beans and cow peas are all made into silage. Silage made from clover and these other crops has a strong and very objectionable odor more like decay than the characteristic sour, but not objectionable, odor of good corn silage. Alfalfa, clover, etc., are cut at the same stage as for making hay, and great care must be used in packing the cut or whole hay into the silo. It must be tramped well to prevent moulding. While these legumes can be made into silage it is generally better to make them into hay and grow corn for the silo.

In California first crop alfalfa that is full of foxtail is frequently made into silage because the beards of the foxtail are softened in the fermenting process.

Corn silage contains 26 per cent of dry matter, of which 16.3 per cent is digestible. Of these digestible nutrients 1.4 is protein, 14.2 carbohydrates and .7 fat. Although clover is a legume, when made into silage it contains only 1.5 per cent of protein, about the same as corn silage, 9.2 per cent of carbohydrates, less than corn silage, and .5 per cent of fat. Pasture grass is richer in protein than corn silage, but has a lower carbohydrate content, the percentages being: protein 2.5 per cent and carbohydrates 10.1 per cent.

If it were possible to have it without too great cost, and have it available every day in the year, blue grass pasture is probably the best single feed for cattle, sheep or horses. But on high priced irrigated land it is generally considered that the annual yield per acre is not great enough to warrant growing it—there may be some other reasons. At any rate most stockmen feel that each acre must produce several tons of feed, and alfalfa hay fills that requirement. But animals should always have some succulent feed. Corn silage supplies this and also meets the "many tons per acre" provision.

An animal on pasture grass seldom has digestive troubles and its good condition is indicated by sleek coat, mellow skin and healthy bright pink color of the mucous membrane tissues of the eyes and mouth. The same is true of silage-fed stock. And when they have learned to eat silage animals are as fond of it as of grass. Sometimes a cow will not eat her first feed of silage readily, but in a few days she will probably be eating it in preference to any other feed that may be offered.

A big dairy cow producing a heavy yield of milk can be fed 35 to 40 or even 45 pounds of corn silage per day. She should have in addition all of the alfalfa hay she will eat and 8 or 10 pounds of grain, say rolled barley, beside that. The amount of grain to be fed will of necessity depend upon the individuality of the cow, the period of lactation and the milk yield. No one can tell a cow's needs so well as a good feeder who is with the herd constantly, and no herd can produce to its limit unless it is in charge of a good feeder who studies the needs of the individual animals.

When silage is fed to horses it is important that no mouldy pieces be included, as this will produce indigestion and sometimes death. Horses should be started on a light feed, five or six pounds per day, gradually increasing to as much as 20 pounds in 20 or 30 days—if it is desired to make silage as great a part of the ration as this.

Because of its odor, a sort of sour smell that is very agreeable to a man feeding it after he gets used to it, silage should be fed to dairy cows after milking. If fed immediately before milking the milk will absorb some of the odor. There was a time when milk from silage fed cows was considered second class, but it is difficult to find anyone with this prejudice now.

Next year, 1915, will be a banner one for California, and many good farmers will have occasion to remember it kindly because it was their first silo season; many hundred will be built and filled next fall.

DAIRY STOCK PRICES

Once in a while a man who owns several good dairy cows wishes to sell one of them. He has seen in his farm paper an account of a sale where some dairy cows have sold for as much as $500. He is apt to conclude, without very much evidence, that his cow is just as good as those which sold at that figure, and to demand that much money. When he does not get it, he is angry at first and after that he is incredulous over such prices; he does not believe any such sums are ever paid.

The misapprehension of what the word "pure-bred" means in the market has given rise to much bitterness of spirit. The grade cow may occasionally give as much milk and as rich milk as the pure-bred, but that does not make the grade worth as much as the pure-bred, for there is a second element of value—that of offspring.

A good many people are utterly unable to see why a calf from a pure-bred cow is more valuable intrinsically than the calf of a grade. This is the reason: The pure-bred calf has known ancestors. If its ancestors are all noted for dairy performances, the assumption is that the calf will have the same characteristics. On this the whole system of breeding is erected. The cow whose ancestors are not known may be an extraordinary individual, but some of her ancestors may not have been particularly good and her calves are extremely apt to inherit their characteristics. In other words, the possibilities of the calf of a grade animal are very uncertain and its value is very doubtful. The chances for value in the calf of a pure-bred are very great, for all its ancestors are known, and if the breeding has been done in a scientific manner, the results are reasonably sure.

The worth of a dairy cow is twofold: She has a milk and cream giving value, and she has a calf bearing value. The later is worth more than the former. If one can sell a calf for $150, its dam is surely worth more than if one can get only $50 for the calf. And the calf's value is dependent almost wholly on its pedigree. The calf has not been tested yet; it is an uncertain quality. Nobody can tell with certainty what a calf will amount to. If we know what all its ancestors did, however, the chances are strong in favor of the calf, provided the ancestors did well.

The term "pure-bred" has no other value than that of knowledge of ancestry and assurance of the laws of heredity. The farther away from this knowledge you get and the greater the number of progenitors whose records are unknown, the less sure will be the probabilities of determining the work of a calf.

Sometimes a false value enters into prices in individual cases, and gives an unnatural idea of what prices should be. This may be called the value of sentiment. For example: A man who has means and who likes to gratify his own whims, takes a particular liking to some animal. The animal belongs to a man whose family have made a pet of it. Wife and children are particularly fond of the cow, we will say, because of its appearance or, as is frequently the case, because of its extreme gentleness. The owner does not wish to sell, so he puts a very high price on his pet cow—much higher than the animal is worth, if it comes down to dairy performance. But the buyer is willing to pay for his hobby and does so. The next time a man prices any neighfor's stock, he is apt to hear something like this:

"Well, John Smith over east of here sold a cow for $250 and my cow gives every bit as much butterfat as she ever did, and is younger besides. If his cow was worth $250, mine is worth every cent of $275."

But probably Smith's cow was not worth $250. Probably a fictitious value raised her price by at least $100, for true value must be based on something definite.

This matter of prices deserves sufficient study to get matters clearly before us. Let us understand the basic facts first of all. Age is of importance, because on it depends the length of her usefulness. Breeding is of vital importance, for it furnishes a strong and reliable means for knowing what her offspring will be worth. That breeding must be good, for a mere record of an animal's ancestors is of no value unless it shows favorable facts. The cow's individuality is worth something. Even the best of breeding sometimes fails to produce good results. There are scrub purebreds which have no particular value. A cow's personal records are of great importance, for if her own performances are as good or better than those of her ancestors, the chances are very strong that her progeny will be superior, provided she is properly bred.

While we often hear of the grade that produces more butterfat than the pure-bred, and while we admit that it is sometimes the case, the general rule is that the pure-bred produces more. The first grade cross sometimes brings most desirable results, but after that there is usually deterioration.

For purely dairy purposes, the grade sometimes furnishes satisfactory results, because she is not so heavy an investment. The pure-bred animal, however, if chosen for constitution, for yield and for individual quality is almost invariably a better buy at a higher price. She gives the largest average dairy returns; her progeny is worth much more and she herself is an asset whose value does not fluctuate.—Rural Spirit.

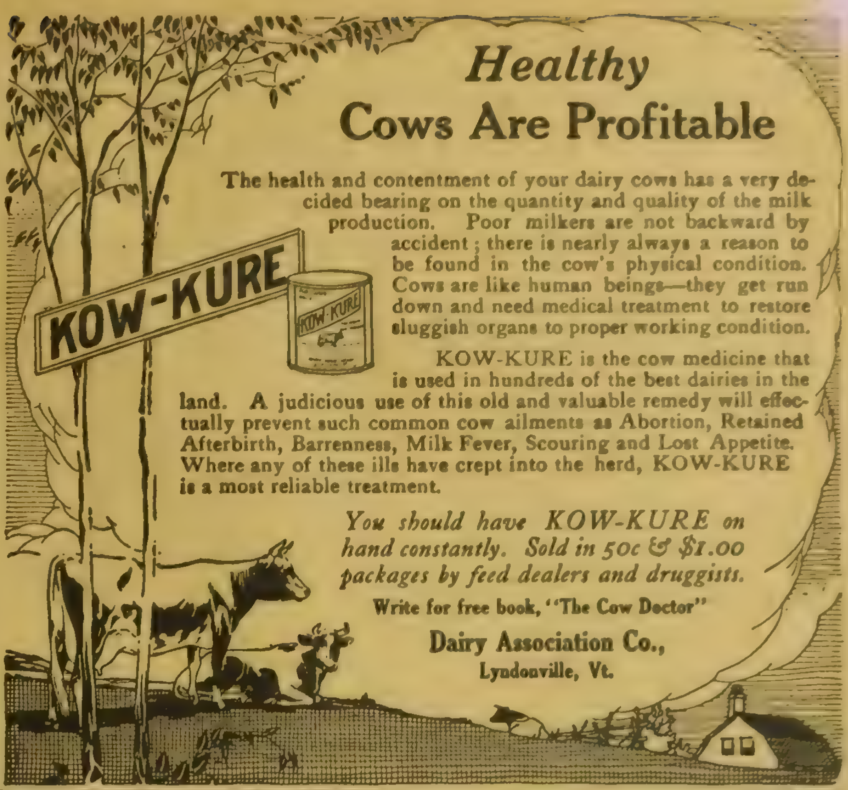
BOT FLY OF THE HORSE

The bot fly is widely spread in the United States. It is the most common internal parasite affecting the horse, states Dr. R. H. Williams, animal husbandman of the University of Arizona Agricultural Experiment Station.

Description.—The adult fly is about the size of a honey bee and covered with short, yellowish hairs. It is present during the summer and late fall months. The fly hovers around the knees, breast, throat and mane of the horses, attaching its eggs to the hair by means of a sticky substance.

Life History.—The eggs are yellowish brown in color and easily noticed on the hair. They develop small hooklets in less than two weeks after they are laid. Horses licking themselves take the eggs into the mouth, where they pass into the stomach, becoming attached to the inner walls. The larvae grow into large fleshy grubs and remain in the stomach for about ten months, after which they pass away with the feces. They soon burrow into the soil and remain therefrom 4 to 6 weeks, when they emerge as adult flies.

Injury.—Horses are much worried by the adult fly, but the larvae do not seem to injure the animal. No doubt some local irritation of the stomach results from the attachment of the larvae to the walls. This may interfere slightly with the normal secretion of the digestive juices. The larvae may also use some of the food nutrients that are absorbed by the stomach walls, and where present in very large numbers the passage of the



Healthy
Cows Are Profitable

The health and contentment of your dairy cows has a very decided bearing on the quantity and quality of the milk production. Poor milkers are not backward by accident; there is nearly always a reason to be found in the cow's physical condition. Cows are like human beings—they get run down and need medical treatment to restore sluggish organs to proper working condition.

KOW-KURE is the cow medicine that is used in hundreds of the best dairies in the land. A judicious use of this old and valuable remedy will effectually prevent such common cow ailments as Abortion, Retained Afterbirth, Barrenness, Milk Fever, Scouring and Lost Appetite. Where any of these ills have crept into the herd, KOW-KURE is a most reliable treatment.

You should have KOW-KURE on hand constantly. Sold in 50c & $1.00 packages by feed dealers and druggists.

GROW SUDAN GRASS

The Most Wonderful Grass of the Age

INTRODUCED AND ENDORSED BY THE U. S. AGRICULTURAL DEPT. AS NO OTHER GRASS HAS EVER BEEN BEFORE. PRODUCES MORE GRAIN AND BETTER HAY THAN ANY OTHER FORAGE PLANT KNOWN. UNDER ORDINARY CONDITIONS YIELDS 300 to 600 LBS. OF SEED AND 3 TO 6 TONS OF CHOICE HAY TO THE ACRE THE SAME YEAR. GROWS WHEREVER SORGHUM DOES. ALL LIVE STOCK PREFER IT TO ALFALFA. QUALITY OF HAY EQUALS TIMOTHY. SOW IT ANNUALLY WHERE DESIRED IN ROWS OR BROADCAST. ADAPTED TO ALL SORTS OF SOIL. RESISTS DROUGHT. STANDS RAIN. IT TAKES 2 TO 6 LBS. OF SEED TO THE ACRE IN DRILLS AND 10 TO 30 LBS. BROADCAST. LAST SPRING THE SEED SOLD FOR $2 TO $4 PER LB. IT IS NOW SELLING FOR $1 PER LB., AND IS SURE TO GO HIGHER BEFORE SPRING AS THE SUPPLY OF SEED IS LIMITED. WE WILL SEND PREPAID BY PARCEL POST 1 LB. OF GENUINE SUDAN SEED FREE FROM ALL OTHER SEED FOR $1—IN LOTS OF 50 LBS. OR UNDER, NOT LESS THAN 1 LB. CONSIDERED. LARGER LOTS SHIPPED BY FREIGHT CHEAPER PRICE. BETTER ORDER NOW AND BE SURE OF GETTING YOUR SEED AND SAVE MONEY BESIDES. ALL WHO SOW SUDAN GRASS SEED ANOTHER YEAR WILL MAKE BIG MONEY. INSTRUCTIONS HOW TO PLANT WITH ORDER.

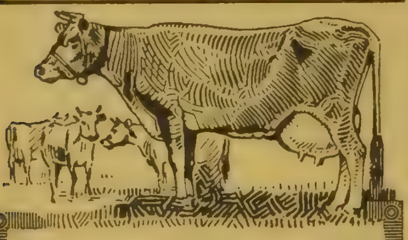
food from the stomach may be interfered with.

Treatment.—No known treatment will remove the bot fly after it has gained an entrance to the stomach, without injuring the horse. On this account, prevention by destroying the eggs is the only way to avoid having the animals affected. The eggs may be destroyed by washing the hair with a dilute solution of carbolic acid or by rubbing the parts with kerosene. Clipping will also destroy the eggs. It would be desirable if all the horsemen in any infested district would start a crusade against the bot fly and stamp it out. However, little action has been taken on the part of horse owners, and unless the animals are confined where they can be treated handily it is doubtful if it would pay to try to resist the attacks of this insect.



LARROWE'S DRIED BEET PULP

is becoming a standard portion of every ration in a rapidly increasing number of dairy herds. Its worth as a succulent, milk-producing, vegetable feed has been fully proven by large and small feeders.

The New World's Champion Cow—Tilly Alcartra

—whose milk record for the past year was over 30,000 lbs. —ate Larrowe's Dried Beet Pulp daily, and to this is attributed a large part of her splendid record.

YOU can increase the supply of milk from your cows at least 1 to 5 lbs. per cow a day by feeding Larrowe's Dried Beet Pulp. It is put up in 100-lb. sacks and can be had either plain or with molasses. Order from your dealer NOW.

FREE BOOKLET—"Profitable Feeding"—giving valuable information and feeding instructions will be sent to any address on request.

SILOS AND LIVESTOCK

Written for California Cultivator By Sacramento Valley Contributor

If the cause is right keeping everlastingly at it is sure to bring success. For a good while a number of agencies have been at work seeking to bring about the production of more meat in the Sacramento Valley. This increased meat production could come only as one of the products of a more intense and a more diversified agriculture of which rotation of crops is one part. The production of more feed for livestock is another, and the storage of feed another quite as important. This is where the silo comes in.

It is very gratifying now to ride through the newly subdivided sections of the great valley and see cows and calves and sheep and hogs and chickens everywhere. And it is a source of satisfaction to know that several silos have been built and filled, that many, many more are in prospect for next year, and it will not be long until a prophecy, that some day there will be one or more silos on every small, irrigated, intensely cultivated farm in the Sacramento Valley, will come true. For the interesting and satisfactory thing about the silo situation is that when one is built in a neighborhood, and the result of having a big supply of succulent feed that can be fed with practically no waste is noted by all who have stock, silos spring up like mushrooms.

Some day the world's record for the production of the greatest tonnage of corn from an acre of land will be awarded to some grower in the Sacramento or San Joaquin Valley. The largest yield we know of now was 56 tons of silage corn per acre, grown in Michigan. One yield from the bottom lands on the upper Salinas River of over 40 tons is reported, but we have not begun to grow corn in earnest yet in California. The California Cultivator has been very much interested in an increase in corn acreage, and this will come by leaps and bounds as the number of silos increases.

HOLLAND AND ITS HOLSTEINS

To understand the cattle in Holland we must first look into some of the conditions that exist there, writes Chadwick Gerow in "Holstein-Friesian World." Of course the Province of Friesland is the one in which we are most interested, as that is where the Holstein-Friesian cattle, or Fries, as the Dutch are pleased to call them, originated.

Friesland is one of the eleven small provinces in the Netherlands, and is located in the northern part, bordering on the North Sea.

The soil is of rich clay quality, the sod being so thick and the grass so fine that it feels like a cushion under the feet. They never have to plow their pasture or mowing fields, the hay comes on year after year in overabundance. This land is worth $500 an acre and can scarcely be bought at that. Many times two crops are harvested, one being gathered green, put in a pile and covered with clay. It makes very good silage.

It has been said that if cleanliness was akin to godliness, the Dutch should have the first row reserved for them in Heaven, and indeed it is so. When you approach the door of the barn, the Dutchman removes his large wooden shoes and walks in his stocking feet, while you, awed by this action, carefully wipe your feet on a mat lying outside the door and follow in fear and trembling. When once inside you can readily understand this preliminary procedure—it is as clean as your parlor. When the cows are in for the winter, the floor is scrubbed on hands and knees once each month and swept every day.

Thus it can readily be seen that prevailing conditions point to a steady, natural development of the great Black and White breed. Feeding is thoroughly understood, the animals getting a good balanced ration during the winter, but in summer (from May to November) the cattle are never stabled and consequently are given no grain. Forced feeding has never been emphasized, but some excellent official year-records are made. The seven-day test is not used. In 1897 the present system of official testing was inaugurated and it is conducted upon the same principle as our semi-official test. Once every two weeks a certified milk controller weighs and takes a sample of the milk of each cow for two consecutive milkings. This sample is taken to the local cooperative creámery or butter factory where it is tested for butter fat—the milk is all paid for according to the percentage of butter fat. In addition the farmer gets back gratis 70 per cent of whey and 12 per cent of buttermilk, both of which are used to good advantage in raising calves.

These official records are all filed in the secretary's office, where, at a glance may be seen the production of any cow since first coming to milk. No test is conducted for longer than 330 days, for they maintain that no cow should remain in milk for a longer period. The highest record cow is Schoon Rier II, owned by R. J. Palsma, Lieve Frouwen Parochie. At five years of age she produced 18,796 pounds of milk (916.96 pounds butter). Average per cent fat 3.89, in 328 days. At first glance this is a very ordinary record, but when we consider that she was only milked twice a day, only given ordinary care in winter and did not consume an ounce of grain in summer, it takes on a different aspect. What record would such a cow as that make if handled by some of our experienced testers?

The type represented by Friesian cattle is ever a source of pride, and the Dutch must be complimented on the high standard they have maintained.

Veterinary Queries

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Lice

I have a ten year old horse that keeps rubbing his body and tail against the wall and anything that he can reach. He is a good horse and in good condition. When he stands close to another horse they keep nibbling one another. Can you tell me what the trouble is? Subscriber, Arroyo Grande.

Lice are the only thing that will make a horse act as you describe. They will be hard to get rid of at this time of the year when the hair is long unless you clip him. Then apply a solution of zenoleum all over. Use a pint of the zenoleum in four gallons of warm water. Sponge him all over with it and put on a blanket until he is dry. Repeat this treatment once a week for three or four weeks.

Milk Leg—Lymphangitis

I have a young mare that has a swelling just above the hoof which extends almost to the knee. It is soft to the touch and is sensitive. It is worse after she is worked a while and makes her lame. She had a colt in the spring and was lame then. The colt was very thin and weak and only lived a few hours. Otherwise the mare is in good condition. What shall I do for her?—Subscriber, X.

The mare has lymphangitis caused by debility. The same condition caused the weakness in the colt. She will need medicine internally and also to apply to the leg. Have your druggist prepare the following: Nitrate of potash eight ounces, bicarbonate of soda three ounces, powdered gentian three ounces and powdered nux vomica two ounces. Mix and give a tablespoon once a day in the feed. Zinc chloride one ounce and water two quarts. Mix and apply to the leg once a day enough to wet the skin. Warm the lotion and brush the skin well before applying it. Warm the lotion in an earthen or granite dish.

Skin Disease

I have a colt two years old next June that started to skin off. Thinking it might be a skin disease I called a doctor who told me it simply had a damper. The doctor came several times and gave him an injection each time but the colt is getting worse every day. What is best to do for it. —Subscriber, Porterville.

Do not fully understand your question but presume the skin trouble is due to a mite. It may be ringworm. We never heard of a disease called "damper." Have your druggist prepare the following and apply it two or three times a week: Tincture of iodine three ounces, iodine crystals two drams and lard oil enough to make six ounces. Brush the parts clean before applying the ointment.

Paralysis

My pigs lose the use of their hind quarters. I was told that it was kidney worms and to give them turpentine but it does no good. The legs seem swollen and there are lumps just above the hoofs. Was feeding sweet, skim milk when they first became affected but am now feeding skim milk and some kaffir corn. Is there any cure for them?—Subscriber, X.

Rheumatism would affect pigs very much as you describe. They should be kept in a warm, dry place at night and allowed to run out in the sunshine during the day. It is more difficult to cure such troubles in cold, damp weather. Get the following powders and give each one a teaspoon once a day in the feed: Sodium salicylate four ounces, phenacetine one ounce and sodium bicarbonate ten ounces. Mix and give as directed.

Hurt in Breeding

We have a mare that was hurt three years ago when breeding her. When we first noticed her condition she dropped only three or four drops of blood at a time but she is continually getting worse. Each time the blood flows more frequently. She is the mother of eight colts. Has had one every year since being hurt and we believe she is with foal at present. Can you give any advice regarding it? —Subscriber, Arcata.

Probably a good sized blood vessel was ruptured that never closed right. The only remedy would be an operation. If one could reach the parts, touch it with a red hot iron or draw out the blood vessel and ligate it.

Throat Trouble

I have a pig that makes a harsh sound when breathing. It coughs sometimes and also seems to have some difficulty in swallowing. Can you suggest a remedy? Is kreso dip equal to zenoleum?—Subscriber, Fairmead.

The pig probably has something lodged in its throat. A splinter of bone or wood, a small nail or a pin may be causing all the trouble. Being so far down it would be hard to reach. It may work out itself in time. Or it might be a small growth of some kind. Can only say that I have had best results from using zenoleum.

Bees and Their Care

STATE BEEKEEPERS' CONVENTION

FOR the first time in its history the State Beekeepers' Association has gone north of Tehachapi for its president, Prof. Willis Lynch of Salida, but teaching in the public schools of Stockton, is elected president. Vice-presidents are not elected by members of the association but presidents of various county associations are ex-officio vice-presidents of the state association. A. B. Shaffner was re-elected secretary and treasurer. The executive committee, in addition to the president and secretary, who are ex-officio members of the committee, consists of Harry J. Hill, Willows, J. G. Gilstrap, Ceres, and Wm. H. Allen of Santa Paula.

A new permanent committee was created which shall have to do with protecting and looking after the interests of beekeepers who are members of the state association. This committee consists of J. E. Ross, Brawley, W. A. Wiggins, San Bernardino, Harry K. Hill, Willows, and Henry Perkins, Artesia.

San Francisco was chosen as the place of meeting in 1915.

Prof. Willis Lynch, the new president, is also chairman of the committee on exhibits at the Panama-Pacific, and Prof. Lynch, Mr. Gilstrap and others have been working hard on plans for the exhibit. The committee is embarrassed by lack of funds as the association is unable to make any advance to cover the necessary expense. This is unfortunate for of all the honey producing sections of the world California leads and it will be a great misfortune to have the state represented by such an exhibit as must be made if insufficient funds are in the hands of the committee. However, the committee announces that it is willing to do the best it can.

Mr. Gilstrap reported for Prof. Lynch, who was unable to be present, that one of the features of the exhibit was to be specimens of honey plants of California together with extracted and comb honey produced from plants of each variety.

Another feature is to be a historical display of beekeeping appliances, that is, as Mr. Gilstrap expressed it, they would like to show everything, a section of a bee tree with its honey stored as the bees do when they follow their wild instincts; next the straw skep, one of the first forms of hives, used by beekeepers of the old world, followed by other forms of hives up to the Langstroth up-to-date movable frame hive. Of course observation hives with bees making honey are to be a part of the exhibit which shall be in the California building or in the "out apiary," which will also be a feature of the exhibit.

Legislation came in for considerable discussion and the determination was expressed to press through the same bill which was passed by the last state legislature but failed to become a law because of the governor not affixing his signature. However, the situation will be complicated this season because of the effort on the part of many agriculturists to secure the passage of a general agricultural bill to create a board of agriculture or commission of agriculture which shall be supreme over all the various boards or commissions which have to do with agriculture or horticulture.

LECTURES ON GARDENING

The Los Angeles city schools are offering a course of lectures on ornamental gardening, open to the general public, especially to attendants at city schools. These lectures will be in the interest of beautifying city and county roadsides and will be given by Professors Gregg and Stevens of the university. They will extend over the period from November 10 to May 11, The topics covered will range from history and landscape art through to the most practical subjects, such as fertilizers and soil fertility, plant propagation, trees for home and school grounds, lawns and lawn making, etc. Los Angeles County is making a special effort to put itself in ship-shape for visitors during 1915.

Dates for addresses to come are as follows: Fertilizers and Soil Fertility, by Professor Gregg, January 5; Location and Exposure, Professor R. T. Stevens, January 19: Plant Propagation, Professor Gregg, February 2; Trees for Home and School Grounds, Professor Stevens, February 16; Shrubs, Professor Stevens, March 2; Vines, Professor Stevens, March 16; Annuals and Perennials, Professor Stevens, March 30; Pruning and Training Ornamental Plants—Tree Surgery, Professor Gregg, April 13; Lawns and Lawn Making, Professor Gregg, April 27; Insect Enemies and Fungus Diesases, Professor Gregg, May 11.

All the above meetings are to be held in the Polytechnic high school auditorium, Los Angeles.

AGRICULTURE FOR BEGINNERS

Agriculture for Beginners, by Charles William Burkett, editor of the American Agriculturist, assisted by Frank Lincoln Stevens and Daniel Harvey Hill, published by Ginn & Company, Boston, at 80 cents.

This book, with a little companion of 22 pages on How to Teach Agriculture, is worthy of being a constant companion for the public school agricultural teacher. While primarily a text book it should prove of value to everyone who has to deal with soils or with any of the problems connected with agricultural practice.

The colored frontispiece was evidently secured at a time when the frost was on the pumpkin and the fodder in the shock. There is scarcely a page on which there is not some illustration, many of them in colors. The remarkable feature of the book is its price. There is an excellent glossary of several pages, with a complete index. It contains a dozen chapters, touching upon the soil, the soil and the plant, how to raise fruit trees, horticulture, diseases of plants, orchard and garden insects, farm crops, feed stuffs, domestic animals, farm dairying, farm tools and machines and other topics.

OF COURSE JOHNNY KNEW

Teacher—Johnny, can you tell me where Lake Ontario is?

Pupil—Yessum; page 18.—Philadelphia Telegraph.

PLANTING AT THE PANAMA-PACIFIC

Into the 65 acres of living gardens surrounding the Palace of Horticulture there have been set the enormous number of 704,000 golden-flowered plants under the direction of Donald McLaren, the California gardener. These flowers will occupy sunken gardens in the main entrance facing the Tower of Jewels and in the Minor Courts of Palms and Flowers. Work has begun on the final transplanting of 27,000 yellow wall-flowers, and an equal number of Spanish golden iris in the Court of Palms, which looks out upon the Palace of Horticulture. The Tower Plaza has already been planted with 200,000 yellow pansies, 100,000 yellow daffodils and 100,000 golden poppies. In the Court of Flowers, which opens toward Festival Hall, 250,000 golden poppies, 100,000 daffodils and 50,000 golden tulips will be set.

So that the 65 acres of flowers and plants will be kept constantly in bloom during the ten months of the exposition, it is planned to replace this first setting with other flowers when the first cycle has lived its life. Mr. McLaren believes that three plantings will be required to keep the vast gardens ever in bloom. An unusual decision was made by Mr. McLaren this week to plant no palms in the Court of Palms, the space being given over to acacias, towering Italian cypresses and low-growing eugenias. The balustrade surrounding the pool will be overhung by low-trailing muehlenbeckia, or maidenhair vines.

The exposition's horticultural gardens became international in scope this week when entries of roses from Belgium and Holland were planted in the rose gardens. These are government exhibits of these two countries and are entered in the competitions, one of which has a prize of $1,000 for a new unnamed rose.

TOLD AT THE CARD TABLE

"A little girl sitting next to me at church was coughing," said Mrs. Jones at the card club. "So I whispered to her mother for permission to slip her a cough drop. The child held it in her mouth a moment and then swallowed it.

"'Would you kindly give her another?' the mother whispered.

"'I'm sorry, but I only had the one,' I answered.

"Coming out of church I felt in my pocket and was horrified to fish out the cough drop. You see, I had had a cough drop and a button in my pocket."

"And what did you do?" chorused the women at the table. "Did you tell her mother?"

"No, I didn't. I was mad. It was the very unusual button from my new suit."

BEST SHE COULD DO

One day a little neighbor four years old was found swinging her cat by the tail. The kitten, of course, was mewing pitifully, but the little girl said, "No use crying, pussy; tan't swing you any faster."

WOMEN'S CAPES

SAXON

For service on the rough country roads, the NEW SAXON CAR has proved its remarkable stability. Its short wheel base making it possible to dodge the holes, and its splendid spring suspension makes "hitting the bump" only a trifle.

Sid Boerstler, of Brawley, drives his car back and forth to Los Angeles, and says he enjoys every foot of the way. He declares it ideal for desert work, as it will not overheat.

To maintain the NEW SAXON costs only a few pennies. It was driven from Tiffin, Ohio, to Los Angeles at a cost for supplies of only $38.70. Ever hear the equal of that feat?

The price—$460. Electrically equipped, $530.

A full announcement of the Six Cylinder 5 Passenger Car will follow soon.

Hawley, King & Co.

1027-1033 South Olive St., Los Angeles

Get the Eggs NOW While Prices are High

GILBERT HESS, Doctor of Veterinary Science, Doctor of Medicine

This is the time of the year when the price of eggs is high and your hens ought to be making up for the small egg crop during moulting.

But hens need a tonic during the winter months, because the lack of exercise and green stuff, and also close confinement, impairs the digestion, makes the system sluggish and the egg organs dormant. With the knowledge I have gained in a lifetime experience as a veterinarian, doctor of medicine and successful poultry raiser, I have succeeded in compounding a scientific preparation that will make poultry healthy, make hens lay and keep the egg organs vigorous and active.

Dr. Hess Poultry PAN-A-CE-A

contains ingredients for toning up the digestive system and enriching the blood. It also contains tonics for toning up the dormant egg organs and making hens lay, internal antiseptics for preventing and remedying gapes and other ailments, also bone and shell forming ingredients. Every single ingredient in my Pan-a-ce-a (printed on every package) bears the recommendation of the U. S. Dispensatory and other high authorities. Now read this carefully:

☞ **So sure am I that Dr. Hess Poultry Pan-a-ce-a will make your poultry healthy and make your hens lay that I have authorized my dealer in your town to supply you with enough for your flock, and if it does not do as I claim, return the empty packages and get your money back. Buy now on that guarantee.** ☜

Sold only by reputable dealers whom you know, never by peddlers. West of Rockies: 1½ lbs. 25c; 3 lbs. 50c; 7 lbs. $1.00; 25-lb. pail $3.00. Pan-a-ce-a costs only 1c per day for 30 fowl.

My new poultry book tells all about Pan-a-ce-a. It's free.

DR. HESS & CLARK, Ashland, Ohio

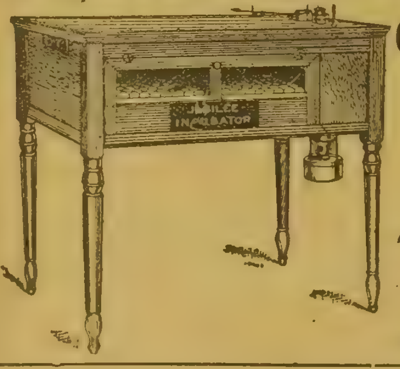
Dr. Hess Stock Tonic

Your cows, horses and hogs are pretty apt to get out of fix during winter, because grain, hay and fodder do not contain the natural laxatives and tonics so abundantly supplied in grass. Lack of exercise is another thing that retards good health.

Dr. Hess Stock Tonic contains tonics that improve the appetite and tone up the digestion, laxatives for regulating the bowels, and vermifuges that will positively expel worms. I guarantee it. West of Rockies: 25-lb. pail $2.25; 100-lb. sack $7.00. Smaller packages in proportion.

Dr. Hess Instant Louse Killer

Kills lice on poultry and all farm stock. Dust the hens and chicks with it, sprinkle it on the roosts, in the cracks, or if kept in the dust bath, the hens will distribute it. Also destroys bugs on cucumber, squash and melon vines, cabbage worms, etc., slugs on rose bushes, etc. Comes in handy sifting-top cans. West of Rockies: 1 lb. 25c; 3 lbs. 60c. I guarantee it.



Going to Hatch Chickens?

How are you going to supply the demand for chicks and eggs for 1915? You cannot make a success unless you use a

Poultry for Profit

LESSONS FROM NATIONAL EGG-LAYING CONTEST

ALL previous records have been broken in the National Egg Laying Contest which closed December 1 at the Missouri state poultry experiment station at Mountain Grove. Lady Laymore, hen No. 611, a S. C. White Leghorn from Nebraska, tied the world's trapnest record for an egg laying contest. She laid 286 eggs in 12 months. She beat Lady Showyou's record by five eggs. The English pen of S. C. White Leghorns won the grand championship by laying 2297 eggs. Every one of the hens in this pen except one laid over 200 eggs.

Why is it that some pens have a single hen in the pen of ten hens that will make a very high record and the remaining birds in the pen will be below the average? We think it is due to the fact that a poultryman like Barron has given much thought and much time to the question of selection and breeding for egg production. Such breeders have done some trapnesting, some pedigreeing, and they know the kind of males and females they are breeding from. Such poultrymen have selected and bred from 200-egg males, that is, males bred from hens with 200-egg records, so long that they have fixed the egg laying characteristics and the egg-laying ability in the entire flock, so nearly so that practically all their hens average well and make good records, barring sickness, accident, or improper methods of feeding and housing, while the other fellows have bred more or less promiscuously and unknowingly. Therefore they only get an occasional high hen. A good fancier might see an exceptionally beautiful bird exhibited by an amateur, but not knowing whether the bird had a line of good breeding back of him, a good fancier would not give much for such a bird to cross on his flock because the birds good points might not be fixed by years of breeding and he might not be able to transmit his good qualities. The same is true in breeding for egg production. In some pens practically every bird gives evidence of years of careful selection and breeding and another pen has only an occasional good bird which shows that these good qualities are not so firmly and uniformly fixed in the flock. Mr. Poultryman, know the history and the pedigree of at least a few of your best breeding males. It pays.

In addition to the above facts our records for this contest and the two previous ones lead us to state the following as being true:

There is an egg type and a beef type in poultry just as truly as there is a dairy type and a beef type in cattle. We find both of these types in all varieties of poultry. And there is also the intermediate, or dual purpose type. We are not going to attempt to describe these except to say that our best hens are medium sized birds, and as a rule, are considerably under standard weight. They are late moulters and practically free from the disposition to broodiness. They have thin pelvic bones, rather high tails, rather narrow skulls, not a masculine head in appearance, large, bright eyes, large combs, long and broad backs carried much higher than that portion nearest the tail; wide behind with plenty of space between the point of their breast bone and the points of pelvic bones, and they must be good feeders, always active and alert. The good laying hens are nearly always somewhat close feathered. We believe that if a White Leghorn with a record of 250 eggs and a Barred Rock with the same record, were both in good health and condition, and were both killed and picked at the same time, you would find a great resemblance and uniformity in the shape and measurements of the body and bones of the two fowls. You would have to make due allowance for the extra size of the Plymouth Rock, of course.

These contests have also proven beyond a doubt in my mind that a reasonable amount of beauty and a reasonable amount of eggs can be combined in the same fowl. The Barred Rock, the White Rock, the Buff Leghorn and a number of the other hens which made the highest records this year, were hens which would not disgrace any show room. The Barred Rock which laid 254 eggs was exceptionally good in color and shape. Just as have some of the fanciers utterly disregarded egg production in their matings, just so have some of the egg men utterly disregarded color in their matings. We do not believe it is possible to produce a record breaking layer and pay too much attention to color, neither can you breed the exceptionally high scoring specimen and pay too much attention to egg production, but we do believe it is possible to breed whole flocks that can average 150 to 180 eggs and have individuals laying from 200 to 250 eggs and still have beautiful color and shape, which is not necessarily standard shape. There seemed to be a disposition at the last A. P. A. meeting at Chicago to gradually change the shape of our varieties until they conform more nearly to the egg type, and that is what we should come to. Also the egg men should strive to improve the color in their flocks, and the standard makers should always bear in mind not to make the color requirements so artificially impossible that a good poultryman could not combine a reasonable amount of beauty in shape and color, and at the same time have a productive flock. We are glad to say that the disposition of the standard makers seems to be in that direction more than ever before.

The highest pens from the different countries ranked as follows at the close of the contest: Pen 0, S. C. W. Leghorns, best English records, 2296 eggs; pen 65, S. C. W. Leghorns, best American records, 2104 eggs; pen 102, S. C. W. Leghorns, best New Zealand records, 1814 eggs; pen 77, S. C. W. Leghorns, best Vancouver Island records, 1774 eggs; pen 3, S. C. W. Leghorns, best Australian records, 1660 eggs; pen

21, White Wyandottes, best Ontario record, 1641 eggs; pen 64, S. C. W. Leghorns, best British Columbia record, 1460 eggs; pen 76, S. C. W. Leghorns, best S. African record, 1352 eggs.

Our experience with foreign pens leads us to believe that on account of the change of season, change of climate and long distances that it is almost impossible to ship birds from Australia and New Zealand and other countries of equal distance and then get satisfactory results. We believe we can breed from these pens one year at this place and raise their young in this climate and they will do far better than their parents. Many of these did quite well, however, considering the fact that they were just about frying size when they reached here last December.

In this contest, which just closed, 115 hens laid more than 200 eggs each. The highest of these hens of each variety is as follows:

Pen No. 611, S. C. White Leghorn, Nebraska, 286 eggs; pen No. 180, White Wyandotte, Pennsylvania, 265 eggs; pen No. 566, Barred Plymouth Rock, Iowa, 254 eggs; pen No. 24, Ancona, Missouri, 243 eggs; pen No. 335, Black Orpington, Nebraska, 243 eggs; pen No. 576, White Plymouth Rock, Texas, 242 eggs; pen No. 456, R. C. Rhode Island Red, Missouri, 239 eggs; pen No. 236, Silver Wyandotte, Missouri, 233 eggs; pen No. 363, Buff Orpington, Texas, 230 eggs; pen No. 476, S. C. Rhode Island Red, Missouri, 227 eggs; pen No. 48, S. C. Black Minorca, Missouri, 225 eggs; pen No. 197, Buff Wyandotte, New York, 222 eggs; pen No. 13, Campine, New Jersey, 216 eggs; pen No. 42, S. C. Buff Leghorn, Michigan, 215 eggs; pen No. 278, Black Langshan, Missouri, 215 eggs; pen No. 524, Buff Plymouth Rock, Missouri, 210 eggs; pen No. 895, White Orpington, Missouri, 205 eggs; pen No. 141, Black Rhinelander, California, 202 eggs.

The hens in the National contest made an average of 159 eggs per hen. There were several hens which did not lay an egg. These will be killed and examind, to determine, if possible, what was the cause of their barrenness. The average would have been at least from five to eight eggs more per hen had the contest started the first of November, 1913.

DO OLD HENS PAY?

How many years shall we keep a hen? This question comes up frequently for discussion, and the answers made by practical poultrymen are bewildering to a beginner. One man says that we should depend upon pullets entirely for laying stock. His scheme will be to keep the hens through their first laying season, then select the best of them for breeders and let the rest go. This plan is based on the general theory that a hen lays more eggs in her first year than in any other. Many poultrymen seem to believe that most of their hens cannot come back and give a profitable egg record the second year. The system based on this theory demands, of course, a vast amount of work in hatching and brooding, in order to keep up a full supply of pullets each year. On the other hand there are poultrymen who say that we may well keep our hens two, three, or even four years, provided we have the ability to judge the layers properly or have some system of weeding out the drones. Naturally if we could keep our hens three years it would mean less work at hatching and brooding.

Does anybody know about this?

Bulletin 135 of the Utah experiment station gives the results of a study in annual egg production. This is based on the records of a flock of seven-year-old hens and their progeny, and figures given are very interesting. For example, a White Leghorn hen in her pullet year laid 103 eggs. Under the usual system of judging layers, this hen would have been discarded as a drone, but the next year she came back with 197 and repeated with 108. In her fourth year she fell down to 72, yet in her sixth year she laid as many as she had when a pullet. It is a question whether it paid to keep this hen after her third year, but such records are necessary in order to learn definitely about such things.

The cost of renewing the flock is considered one of the greatest drawbacks to the poultry industry, the authors estimating the cost of a pullet—probably up to laying age—at from 50 to 60 cents. The average productive life of hens cannot be estimated at this stage of their work, but for the strain used in their studies was thought to be about four years. The range of individual egg production in their flocks was found to be from 100 to 160 in the first year, from 105 to 140 in the second year and from 100 to 130 in the third year. After the third year the production remained fairly constant at about 90, with a variation of not more than 10 or 15 eggs per year.

THE BOURBON RED TURKEY

Written for California Cultivator

By Mrs. N. S. Ferris, State Vice President N. B. R. T. Club.

MR. J. F. BARBER, of Monticello, Arkansas, claims to have bred these turkeys for 25 years. He at first advertised them under the name of Bourbon Butternuts, but later changed the name to Bourbon Reds; Bourbon after his native county in Kentucky and Red because of their color. The original stock was the little common yellow turkey of the Alleghenys. Each year he selected the largest and best marked ones, that is, those with the darkest plumage and the whitest wings and tails. Occasionally he would throw in a cross with the Bronze to increase size. This may, I think, account for the barring across some of the feathers which seems almost always to be found in the toms and occasionally in the females.

The standard as adopted by the American Poultry Association calls for a dark, even chestnut red body, clear white primary and secondary wing, and white tail. Weights, adult cock 30 pounds; yearling cock, 25 pounds; cockerel, 20 pounds; hen, 18 pounds; pullet, 12 pounds.

There is a very much alive National Bourbon Red Turkey Club, a member of the American Poultry association, which has for its object the advancement of the breed along standard lines. It is working for a bigger turkey, a redder turkey and one with clear, white wings and tail. While the weight standard is exceedingly high for the breed, and is hard to reach, as is the case in all varieties of turkeys, the color is fast becoming better. I have received several hens from eastern breeders that have the entire tail white, one of them having the body feathers as dark as those of the male bird, though according to the club's standard the female may be a shade lighter than the male. Some leading eastern breeders advertise 40-pound toms with the dark even body and the all white tail, but these birds are the exception in the breed, and those who have birds of good shape and size, of even dark body color and with tail three-fourths clear white may consider that they have excellent stock. A few more years of careful selective breeding will make a huge difference in these points.

Contrary to a statement recently made, the Bourbon breeds remarkably true. Many times they come with much more white in tail than either of the parents, due undoubtedly to good blood back of the mated individuals. As in all pure breeds of poultry there are sometimes culls. Occasionally a hen will come much too light in body color. This, I expect, is a throwback toward the yellow turkey and the bird should not be bred. Rusty wings are still occasionally seen and sometimes a light spot or "bib" on the neck, which usually disappears with the first moult.

This breed of turkeys is remarkable for its beauty. The toms have a distinct, narrow black band across the ends of the body feathers, while in the female the body feathers have frosted edgings. To my mind a strutting Bourbon tom with his glistening chestnut red body and wide spread white tail is second in attractiveness only to the many hued peacock.

The utility qualities of the breed are fully equal to its unsurpassed beauty. In common with the White Holland they mature earlier than the Bronze. Like all early maturing varieties, they have small bones, rather short legs and round, plump bodies. As they make bone they also make flesh, and it is a poor specimen indeed that must be kept over until Christmas to be in proper marketable condition. This makes a desirable saving to the breeder as well as to the careful housewife who much prefers to pay for meat and little bone. The size, intermediate between that of the White Holland and the Bronze, makes it a very desirable bird for the average family, which nowadays often eats Thanksgiving chicken rather than pay for the very large and expensive turkey. The hens are excellent layers. This last season my yearling hens laid from February until they moulted in October, some laying over six and seven dozen eggs in the season. They lay in places most convenient for the caretaker, in the chicken houses, in the barn, one even insisting on trying to get into a trap nest.

Those interested in this most useful breed, who would be glad of more information than I can give, I refer to Mrs. Minnie M. B. Brown, Appleton City, Missouri, secretary-treasurer of the National Bourbon Red Turkey Club, who has at her command bulletins and other literature on the subject.

Many breeds have been considered most desirable until something better came. The Bourbons are now making a remarkable gain in popularity and "there is a reason."

flock as soon as the hatching season is over, so as to produce infertile eggs.

Infertile eggs are produced by hens having no male birds with them.

Infertile eggs keep much better than those that are fertile.

The male bird has no influence on the number of eggs laid.

The hen's greatest profit-producing period is the first and second years.

February and March are the best hatching months. Chicks hatched during these months are freer from sore head than those hatched later.

Do not allow sitting hens to remain in the hen house. By so doing many eggs are started to incubate, which renders them unfit for use at home or to market.

If possible place the brood coops near the cornfield, which furnishes both shade and fresh ground.

The free use of kerosene or crude petroleum on the roosts, dropping boards, in the cracks, and around the nests will exterminate mites. White wash is also good.

Spray the brood coops once a week with some of these solutions and move to fresh ground.

Be sure and feed the table scraps to the fowls. Milk is one of the best feeds for egg production.

THE POULTRYMAN'S OPPORTUNITY

There is no reason for good poultrymen to be alarmed because of the present situation which we are facing on account of the European wars or the high price of feeds. The man who has a good laying strain of pure bred poultry is going to get enough eggs this winter to pay his feed and labor bills and net him a nice profit. Neither will the man who has a good strain of pure bred exhibition poultry suffer, because good breeding stock and eggs in 1915 are going to be scarce and high. We believe that eggs will likely be higher this winter than ever before. So the good poultryman need not be alarmed. On the other hand we believe this is really the poultryman's opportunity. But the fellow who will suffer most is the man who has scrub poultry that has neither been bred for eggs nor exhibition.

When times get hard or the price of other food products advance, then it is, as is shown by the past history of the industry, that people turn more to poultry raising than before. Thousands of shop men, clerks, mechanics, and laboring men in cities and small towns then turn to poultry as a side line to help pay the "high cost of living." It is certain to be so again. However, because of this uneasiness, there is great danger of many fine flocks, which it has taken years to

Barred Rocks—Only a few fine breeding cockerels for $3.00 each. G. L. Hawley, Madera, Cal.

White Plymouth Rock Cockerels, standard bred birds. Ramona Farm, Box 1361, R. D. 2, Sacramento, Cal.

White Orpingtons—Pen of six fine year-old hens and cock, $14.00. Mrs. H. N. Taylor, Box 907, Chico, Cal.

HORTICULTURAL PRINTING

Catalogues for the seed and nursery trade. The live stock and poultry industries are a specialty with us. Two thousand illustrations to select from. Write for prices and samples. The Kruckeberg Press, 237 Franklin St., Los Angeles.

LIVE STOCK

Ohio Improved Chester White (O. I. C.) Entire herd immunized against hog cholera.
Nothing but immunized stock sent out. Extra fine lot of fall pigs, both sexes, ready for shipment during December and January. Three herd boars used. All stock crated and registered. Make reservations now. C. B. Cunningham, Mills, Sacramento Co., Cal.

Grape Wild Farm Thoroughbreds—Guernsey Bulls of A. R. Breeding. BERKSHIRE HOGS. Finest herd in the state All ages for sale. A. B. Humphrey, proprietor. Mayhews, Sacramento Co., California.

For Sale—Young Hampshire boars of good stock; yearling GUERNSEY BULL from Imp. Lord Kitchener. Dr. J. W. Anderson, 503 First Nat'l Bank Bldg., Berkeley, Cal.

For Sale—Young registered Berkshire boars and sows; fine, strong stock. Boars ready for service—January. Stanislaus Ranch Co., Crows Landing, Cal.

Duroc-Jersey Boars—Four months old; registered. Fine individuals. Silver-Spangled Hamburg roosters. Prices reasonable. Tribble Nurseries, Elk Grove, Cal.

Thoroughbred Berkshire Boars of all ages from developed and large-boned hogs Riccomi Bros., Mountain View, Cal.

Glenview Poland China—Stock for sale Chas. R. Hanna, R. F. D. No. 3, Riverside, Cal.

M. H. Locke Co., Lockeford, Cal.—Choice young Jersey bulls for sale.

FARM LANDS FOR SALE

VICTORIA, AUSTRALIA, WANTS SETTLERS

Special inducements; government land, railways, two schools; cheap irrigation; 31 years to pay for farms adapted to alfalfa, corn, grains, fruit, etc.; climate like California; ample markets; reduced passages; special excursion being arranged. Free particulars from F. T. A. Fricke, Government Representative from Victoria, 687 Market St., San Francisco, Cal., Box X.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

For Sale—800 acres, large and small tracts, Pittsburg County; farming, pasture, oil and gas land. $5 to $25 per acre. Write JOHN CAVANAGH, McAlester, Okla.

A Splendid Chicken and Fruit Ranch, improved, 80 acres, very cheap at $3000. Address owner, A. Frederikson, Santa Maria, Cal.

MISCELLANEOUS

We are preparing to move from one of our warehouses to a new one, and find hundreds of items that we wish to close out quickly. Plows, Harrows, Land Rollers, Ridgers, Drills, Transplanters, Cultivators, Mowers, Rakes, Feed Cutters, Cream Separators, Milk Cans, Pails, Barn Equipment, Gas Engines, Scrapers, Vehicles, Wagons, Trucks, Garden Tools, etc. Prices sharply reduced. Write or call and see us. Newell Mathews Company, 200 N. Los Angeles St., Los Angeles.

Free for Six Months—My special offer to introduce my magazine "INVESTING FOR PROFIT." It is worth $10 a copy to anyone who has been getting poorer while the rich, richer. It demonstrates the REAL earning power of money, and shows how anyone, no matter how poor, CAN acquire riches. INVESTING FOR PROFIT is the only progressive financial journal published. It shows how $100 grows to $2200. Write NOW and I'll send it six months free. H. L. Barber, 430, 28 W. Jackson Blvd., Chicago.

Musical Instruments—All kinds tunes, repaired, bought, sold, exchanged; expert violin repairing; bow 75c. Bargains in used instruments. Lindberg Music Co., 219 W. 2nd St., Los Angeles, Cal.

"Smith's Pay the Freight"—To reduce the high cost of living, send for our Wholesale to Consumer Catalogue. Smith's Cash Store, 112 Clay St., San Francisco.

TURKEYS

For Sale—Mammoth White Holland Turkeys. Mature hens and toms. ALSO young stock from five distinct pens headed by toms from yards of leading breeders of this breed in the state EGGS IN SEASON. Orders given prompt attention. Prices on application. Address H. McKusick, Box 733, Calexico, Imperial Co., Cal.

Mammoth Bronze Turkeys—Strong, vigorous, well marked toms and hens from the best blood of prize winning and utility stock. Prices reasonable. Geo. A. Smith, Corcoran, Cal.

Sharp's White Holland Turkeys made a clean sweep at California State Fair, including sweepstakes. And also at Fresno County Fair. Also snow white Leghorns; stock for sale. Henry Sharp, R. 2, Box 70, Selma, Fresno Co., Cal.

Red Bourbon Turkeys for sale. First prize winning birds. 3 pairs breeders 1½ and 2 years old, and younger stock. Some fine young toms and pullets. A. E. Balmer, Alhambra Valley, Martinez.

Giant Bronze Turkey Toms from prize winning stock; weigh over 20 lbs. at 8 months. Write for prices. Mrs. Nellie Hart, Holtville, Cal.

SEEDS AND PLANTS

Strawberry Plants — Gold Dollar, Clark Seedlings, Magoons, Wm. Belt, Marshalls, Goodells, Early Ozark, and new Oregons, $2.50 per thousand. Thoroughbred plants. Mr. John Christiansen, R. F. D. 2, Canby, Oregon.

Strawberry Plants—Inspected, packed in moss; 5th year. Magoon, Marshall, Klondyke, New Oregon, Early Ozarks, Hood River, $2.50 per 1000. J. W. Vinacke, Canby, Oregon.

Berry Plants, Rhubarb, Cacti—It will be worth your while to send me a postal right now if you are interested. Louis F. Scribner, R. 2, Pasadena, Cal.

Rhubarb—Crimson Winter, $3.00 per hundred; Wagner's Giant, $5.00 per hundred. Good, strong, one-year plants. Currier Bulb Co., Seabright, Cal.

For Sale—Avocado Seed, also fine budded "Taft" Avocado trees. C. P. Taft, Orange, Cal.

For Sale—Beldi Barley, clean for seed. H. Pile, Ramona, Cal.

HELP WANTED

Wanted—3 or 4 berry growers to come to SANTA CRUZ, CAL., to grow berry plants for us under contract for 5 years; will also buy all the fresh berries when we put up our new berry-drier in 1916. We will guarantee that you will double your money each year. We need 1,000,000 berry plants grown each season, and also use 100 tons of berries for our drier. Send for particulars to SANTA CRUZ BULB & PLANT CO., 8 NEW ST., SANTA CRUZ, CAL.

We have an unusual proposition to make any young man or woman who is planning better things for the future. You must have business education. You can earn board, room and tuition. Telegraphy, stenography, bookkeeping, English branches. Write now. Mackay Business College, 910 Main St., L. A.

Man Wanted to Run Alfalfa Ranch on salary, cash or share basis; must loan owner $2500.00 and accept second mortgage on ranch as security. Forbes Realty Co., 400 Laughlin Bldg., Los Angeles, Cal. Phones, Home A-1168, Main 8641.

Brandywine Strawberry ,Plants — Fine large plants. J. H. Shirk, Tulare, Cal.

RABBITS

For Sale—New Zealand Rabbits. "The best meat producers." A grand bunch of fine, red, half-grown youngsters. 1 buck and 3 does for $5.00. Also mature stock. Your chance to secure a start of this splendid strain at small cost. Shipped anywhere. Standard Rabbitry, Santa Ana, Cal.

Thoroughbred Rufus Red Belgian Bucks—Heavyweight, with pedigree; breeding age; $2.50 each. Common hares of Rufus origin, reasonable. Write Arthur Nygaard, Box 115, Orland, Cal.

New Zealand Reds—Scored and sold on merit. Investigate. Our Catalogue is free. Caldwell Bros., Los Angeles, Cal., Box 613

DOGS

Pedigreed Scotch Collie Pups four months old. Males $5.00, females $4.00. C. Keaton, Route 5, Box 58, San Jose, Cal.

APPLE CULTURE

(Continued from Page 647.)

buds from the base upward. Planting such a specimen makes it possible to start the head of the tree correctly, and to give one complete control during subsequent training.

Systems of Planting

The common systems of planting are the rectangular (trees planted in rectangles or squares); quincunx (planted in fives—rectangles or squares with a tree in the center of each) and the hexagonal (trees in groups of seven, six in a circle with one at the center of the circle). The rectangular is the most commonly used. This system permits of intercropping and the greatest ease in caring for the orchard. The quincunx is the ideal system for planting with fillers. The fillers may be removed later, and the trees then stand in rectangles or squares. The hexagonal system gives good spacing, all trees being equal distances apart in all directions, consequently equally exposed to light and other conditions. Small varieties whose top development is slow, require about twenty-five feet of space. Rank growing varieties may need as much as forty-five feet of space. Twenty-eight to thirty-six feet are good averages.

Planting

The size of hole for planting the tree depends upon the nature of the soil. The more compact the soil, the greater should be the diameter of the hole up to thirty inches. Soil should be removed to a depth of fifteen to eighteen inches.

Previous to, or at the time of setting, all trees should be examined very carefully to detect all diseased or otherwise infected ones, so that they may be discarded. The roots should be trimmed, in order to remove all broken and mutilated portions of branches and thin out the thicker ones, providing good space for the remainder. Shovel loose soil into the bottom of the hole, preferably top soil; place the tree in this loose soil with the roots spreading out in their natural position; work the dirt under the crown and around the branches with the fingers, being sure that the soil comes in contact with every root, and all spaces are filled, excluding the air. After the roots have been covered to a depth of two to three inches, soil may be packed by trampling with the feet. The upper three or four inches of soil should be left loose, in order to form a mulch that will conserve the moisture. When the tree is set, it should stand erect, and two to three inches deeper than it stood in the nursery row. Immediately following setting, cut off the top about thirty inches above the ground. This cut should be slanting, and about one-quarter of an inch above the bud.

Training the tree

During the first growing season remove or arrest the growth of all the branches that will not be needed in building the framework of the tree. Three to five scaffold branches should be saved. All growth below the lowermost scaffold branch should be rubbed off as soon as it starts. Should the growth be very vigorous, which is apt to occur in the warmer sections, the scaffold branches may be cut back during the middle of the summer, so as to induce them to rebranch and make a growth that will mature before the advent of winter weather. In cutting back the scaffold branches during the summer, enough of each branch must be removed to induce laterals to form at the points where the scaffold branches should be forked.

Training during the second season consists in removing a few cross limbs, and shortening the branches, which work may be done either during the winter or summer, or both, depending upon the rate of growth. Training must be done frequently enough to insure a proper framework, yet at the same time, moderately, so as not to interfere with the development of proper fruiting habits.

General field practice has shown that the open or vase-shaped top permits of the greatest ease in cultivating, pruning, spraying, thinning and picking the fruit. Red varieties of fruit color best when exposed to the light. The tops of such varieties, therefore, should be open. The tops of the yellow varieties may be allowed to develop more brush within the interior, since the fruit develops perfectly with less exposure.

Pruning

When grown under the most favorable conditions, the apple tree requires very little pruning. The training of the tree secures the desired framework and shape. Where there is a tendency for the tree to begin bearing at an early age, and overbear thereafter, with a tendency to accelerate wood growth, winter pruning is generally practiced. Conversely, if there is a rank growth of top, and the tree is prone to produce fruit, the habits of the plant may be corrected by pruning during the summer. A serviceable method for determining this time is to note the development of the terminal pair of leaves on the young wood. Pruning should be done at the time these leaves are turning from light to dark green. The parts and amounts of the trees to be removed must be determined by the pruner, since each individual of a variety, as well as each variety, presents very different problems, even grown under the same conditions.

Bracing Trees

During the bearing period, it not infrequently happens that a tree produces more fruit than it can carry without additional support. In all cases where injury to a tree is apt to occur, additional support should be given it, in order to relieve the strain. Weak crotches may be strengthened by putting bolts through the branches above them, and wires extended to the upper portions of the tree. The same object may be accomplished by placing props from the ground at needed points, or by carrying the weight of a branch on a rope from a temporary mast, set alongside, and tied to the trunk of the tree.

Cultivation

Cultivation in the young orchard should be continuous until the trees come into bearing. During the years preceding fruiting, it is necessary to promote the growth of the plant by giving it a uniform supply of food, which results are best accomplished through clean cultivation.

Irrigation

The apple tree requires a constant supply of moisture during the growing season. Either with natural rainfall or irrigation, an over-supply of moisture, alternating with periods of great deficiency, damages the plants severely. Under irrigation, the time for applying the water can best be determined by testing the soil with an auger, noting the moisture conditions to a depth of four to six feet. Applications of water should be made at intervals frequent enough to keep the soil constantly moist. During the application the amount should be of sufficient volume to wet the soil to a good depth, after which time water should be withheld until a subsequent irrigation is necessary.

Intercropping

During the period that it takes to bring the orchard into bearing, the utilization of the ground lying outside of the area occupied by roots of the tree is desirable. Unless the fertility of the soil is utilized, much of the unused portion will be lost. Garden truck, small fruits, bush fruits or any other hoed or cultivated crops may be grown, provided the care given the ground occupied by the intercrop does not interfere with the proper growth and development of the trees. It is quite possible to produce crops between the rows that will pay all or the greater part of the running expenses of the orchard. During intercropping, one should bear in mind that trees will occupy a space three to four feet outside the spread of the top; therefore the intercrops should be planted beyond this area.

Pests and Diseases

A large number of diseases of the fruit and tree are controlled through the proper use of fungicides and insecticides, or a combination of them. The intelligent and successful control of an organism causing injuries to the orchard requires a good knowledge of the life cycle of the organism, the orchard practice required to control or eradicate it, and proper spraying methods.

Most fungi causing diseases of the apple tree and fruit are internal parasites, only controllable by removing and burning the diseased portions, or by applying substances to the surface as protective coats. Bordeaux mixture, lime and sulphur, and atomic sulphur are the leading fungicides.

Insects are of two general types, classified by feeding habits. Insects that chew and swallow their food may be poisoned by coating the food plants with some stomach poison, such as arsenate of lead, or arsenite of zinc. Insects that suck the juices from plants cannot be poisoned but fortunately they have soft walled bodies, and are usually exposed, making it possible to kill them by coating the body

IRRIGATION PRACTICE

(Continued from Page 649.)

I have never seen so great a change in the character and mechanical condition of soil in so short a time as there has been in this orange grove, and while it is not like loose, mellow, sandy loam yet, it absorbs moisture many times more readily than before and is a far more pleasant and tractable soil to irrigate and cultivate than before. And that this treatment has been proper is conclusively shown in the increased vigor and growth of the trees and in the crops they have produced.

During the season of 1913 it was found difficult to get moisture to penetrate more than nine or 12 inches in some heavy land on which there was young seeding of alfalfa. Water was delivered in a head of five cubic feet per second and it was ordinarily divided into three or five checks. The checks are 25, 40 or 50 feet wide and 660 feet long. By dividing the head into 10 or 15 checks and letting it run for a longer time, then turning it off these checks, irrigating some more, and then irrigating these a second time before they dried out, it was possible to get a penetration of 24 to 48 inches.

So much in a general way for the object of irrigation, the importance of studying the individual case, the need of constant observation of changing conditions and the application of common "horse sense" and judgment to the problems presented.

After a prospective irrigation farmer has selected a location the next step is the

Preparation of the Land

Unless the owner of the land or the man who is to do the leveling is very familiar with this kind of work, it will pay to get a reliable, experienced engineer to lay out the place. By experienced I mean one who has had experience in the particular locality and under similar conditions to those prevailing on the place to be improved. In this way it is possible to benefit by the mistakes that have been previously made in handling the soil, water, etc., in the district in question.

Even if the owner is experienced a map of the place, with the proposed present development and all future development, should be made showing the approximate location of drains, ditches, checks, or borders, boxes, etc.

During the early days of the development of the Sacramento Valley Irrigation project these farm plans were made by company engineers for all settlers who made application for them, and blue prints were furnished. The engineer first discussed with the purchaser his general plans for developing his place, found out about where he wanted to build; how much alfalfa he wanted and how much orchard. He then laid out the drains and ditches in the most convenient places for operation and where they could be built most cheaply. Some changes have been made in these plans by the settlers as they have developed their places, but in the main they have been followed, and even though only a small part of the place may be developed during the first or second year, such work as is done is not wasted and will not have to be done over again to fit into future plans, as has often been the experience on farms developed in a haphazard way.

There seem to be many places where a prospective irrigation farmer can spend money for the counsel and advice and service of men experienced in the details of the business with the assurance that if he gets the right men and the right service it will be money very well spent. In fact $100 spent for advice could easily save $1000 in real, absolute value in the purchase of one place rather than any one of several others that might seem equally desirable to a novice, and an experienced engineer can surely make a big saving in development costs by properly laying out and planning the work to best meet the requirements of the particular job. The per acre cost of such work on the developed place will not be great.

There are a great many good land levelers and farm developers in the Sacramento Valley now, and many good schemes for removing the dirt required in digging drains, constructing ditches, making borders and leveling the land between the borders, assuming that a border system of checking land for alfalfa or trees is to be used. And any system is a good one that results in the construction of drains of ample depth and capacity—ditches big enough to carry the water required and with good, full banks that will insure their stability and a minimum of breaks and trouble, borders or checks large enough to control the flow of water but not larger than is necessary to accomplish this after they have settled, and in land well leveled between the borders so that the water can be evenly applied and quickly and completely drained off when required.

For a great deal of the heavier, rich land in Glenn and Colusa Counties in the Sacramento Valley checks or borders 25 to 50 feet wide and 660 feet long have been found very satisfactory for alfalfa, and for tree planting it is an advantage to plant trees on these small borders, thereby giving a little more open and well aired soil for the roots to start in. This is especially beneficial if there is a wet year one or two years after planting.

As I have said there are many good land developers in the Sacramento Valley with many favorite plans for proceeding with a job of leveling, but my way is to first dig the drains, then the ditches, then the borders or checks, and lastly, move such dirt as is necessary to complete the leveling of the land between the borders. Dirt must be moved, either in making cuts or fills, for each of these features and my plan is to never move the same scraper full of dirt but once if it is possible to avoid it. The dirt that comes out of the drain is used for any part of the balance of the job where it is most convenient to waste it, on a ditch bank, a border or in a hole in the check, but it must be deposited where it will not have to be moved again. The dirt excavated from the delivery ditch goes in a border or in a fill, and dirt required for banks comes from high places in the check. Then the balance of the dirt for the borders comes from cuts in the checks—and any remaining fills to be made in the checks after borders are made must come from the remaining cuts within the checks.

Now this work is frequently done in exactly the opposite order, the land is leveled wtih some leveling device or even with scrapers, then the borders are made. Some of the same dirt that has been moved to fill a hole in the check may have to be moved again to get dirt for the border and some more dirt moved again to fill the hole just made. Then a borrow pit must be made to build ditch banks, and fre-

quently a long haul made to spill the dirt from the drain evenly over the check.

I do not recall an instance of too great care being used in the leveling of land. I know of many cases where too much money has been spent for the results accomplished, but none where a job has been done so well that the land irrigates more easily than is profitable or where it drains too perfectly. But everywhere there are examples of the loss of crops and money through too careless preparation of the land for irrigation. High spots that do not get water, low spots where the crop drowns out, ditches that break, drains that are too shallow or that do not work, all of these things can be remedied with far greater ease and much less cost before a crop is planted than after, and there is no better or surer way to find out about these things than to try out the job with a head of irrigation water before any crop is planted. This will show up the weak places at a time when they can be easily and quickly fixed. Then after they are all remedied, try irrigating the land again before planting; there may be several other little things you will be glad that you have fixed before there was a crop in the way.

And it is a wise thing for the beginner to lay out a small piece for the first planting rather than the whole place. There is no way to learn how to prepare a place for irrigation so that it suits your individual tastes so well as to fix up a small acreage first. There will be sure to be some little changes you will want to make in the rest of the place.

Water Delivery System

Whatever this is, whether open ditch or underground concrete pipe, have it of ample capacity. I know of no better way to determine what this will be for the individual needs of any particular place than to visit one where a system similar to the one contemplated has been installed. An engineer can be of help on the size and capacity of concrete lines, as he can on open ditch capacities, but any irrigator who has handled a head of water in a ditch will tell the inquirer that the ditch must be plenty big for the head of water, have big, full banks, and if possible the slope of the banks should be such that they can be mowed with a horse mower. It is hard to find dirt to enlarge a small ditch after a field is completely seeded to alfalfa.

The working out of all of the details of irrigation practice in the Sacramento Valley is a proposition that is in its infancy; the best general advice I can give to anyone is to study his individual problem and don't be afraid to dig holes in the ground.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Roup in Turkeys

What is the cause and remedy for turkeys having swelled heads? I have some young ones and some of them have a swelling on each side of the head above the nostrils. They are on the range and are fed wheat, corn and oats, and fresh meat every other day and a steamed mash the rest of the time. Will turkeys fatten better cooped up or at large?—Subscriber, Utah.

It is a bad cold or roup. Examine the swellings and if they are soft open them with a sharp knife and wash out the cavity with warm water that has a little carbolic acid in it. Keep them in a warm, dry place until well. Feed them chopped onions in the mash and also put in a teaspoon of red pepper and a teaspoon of sulphur for every eight turkeys. They will fatten much better cooped up.—W. E. P.

Chicken Pox of Turkeys

Two of my turkeys have sore spots on their heads. Some of the spots are raised and hard and some flat. There is no pus.—Subscriber, Porterville.

Your turkeys have chicken-pox, which is a very infectious disease. It may have been brought to them on the shoes or clothing of visitors or on your own, if you have been near infected birds, or they may have taken it from germs remaining on the premises from previous invasions of the disease. As they seem to have it lightly, anointing the sores with carbolated vaseline or some other antiseptic ointment will probably be all the treatment they need. Your main care should be to be rid of the infection before it reaches the rest of your flock. Keep the affected birds in quarantine and thoroughly disinfect roosts and feed troughs with carbolineum, zenoleum, carbolic acid or cresol disinfectant. Scald all porcelain and tin vessels with boiling water, and take every precaution not to carry the infection from the sick birds to the well ones.—J. A. K.

Worms

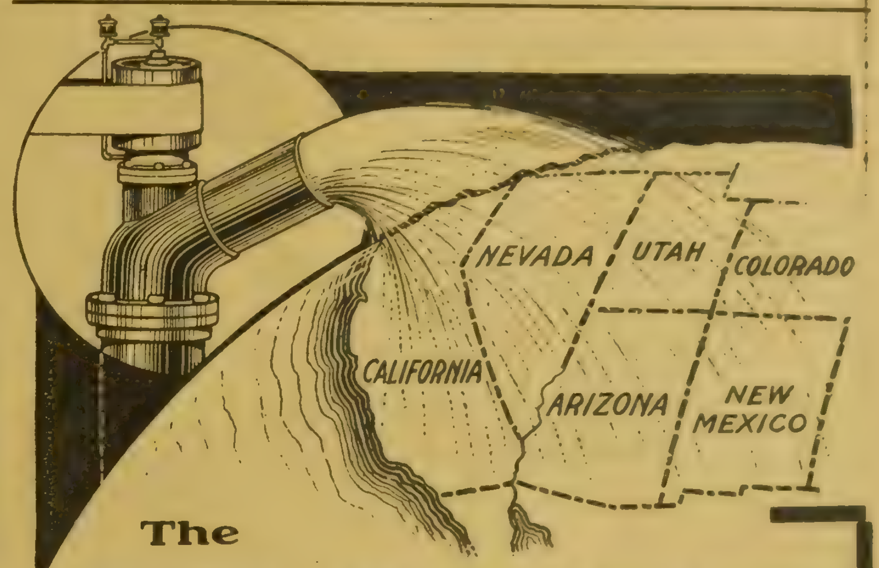
Chickens three to four months old get droopy and in a few days die. Dissection shows their entrails to be swarming with worms two and one-half to four inches long. Can you inform me of cause and treatment?—Subscriber, Owensmouth.

One of the best remedies for worms is oil of turpentine which may be mixed with an equal quantity of olive oil and 20 to 30 drops of the mixture given at a dose. This is followed in two hours by two to three teaspoons of castor oil. Pumpkin seeds are considered an excellent remedy by many practical poultrymen. They should be chopped or ground and fed to the chickens after a fast of from 12 to 24 hours. The best way of giving any worm medicine is to feed but lightly at night and then give the remedy in the morning before the birds have eaten. Two hours after the medicine give castor oil or Epsom salts, 40 grains for an adult bird, half as much for half grown stock. An hour later the birds may have a light ration. It is difficult to say just what is the cause of worms. Some authorities say there are always a few in the intestines, but it is only occasionally that they become numerous enough to make trouble. Others declare that feeding milk causes them. Sometimes, no doubt, they come from infested soil. If the ground you are on has been used for chickens a good may years it would be a good plan to move them to clean ground, at least until a crop of some sort can be grown in the runs that are infested. Feeding troughs and drinking vessels should be thoroughly disinfected.—J. A. K.

Lemons Pollenizing

I am told that Ponderosa lemons will mix with other varieties in the orchard. Is this so?—Subscriber, Santa Cruz.

It depends upon what our subscriber means by the word "mix." As to affecting the fruit of a Eureka or Lisbon, or other desirable variety, we do not think there would be any material effect from planting the Ponderosa in the orchard. It is possible they might have more seed and if these seed were planted and seedling trees allowed to grow without budding it is reasonably sure that the tree would show the effect of the inferior fruit being planted in the orchard. We realize that cantaloupe or melon growers will not grow their melons nearer to cucumbers than is absolutely necessary because of the effect of the pollen from the cucumber blossoms on the fruit which comes from the melon



The

Biggest Water Developer

LAYNE & BOWLER PUMP

Throughout the West, this pump is in evidence—on all kinds of ranches, out on the desert, up in the mountain districts—in fact, wherever a good, reliable, all-round efficient pump is demanded. The Layne & Bowler Pump is constructed in a manner to incorporate as few and simple parts as possible. Positively the cheapest water is produced. It's the pump you should install.

Our descriptive Catalog No. 30 not only gives full details about this pump, but gives valuable irrigation information. Send for it without delay.

blossoms but growers of tree fruits, as a rule, do not consider this effect at all injurious.

Planting Iris

Can one set Japanese iris at this season?—Subscriber, Covina.

Yes, you may plant it at once. In fact, German and other iris may also be planted now though if planted earlier it would have been as well.

40 Acre Equipped Farms

On every 40 acres we install a pumping plant, provide trees and seed adapted to the soil, and necessary farm implements to begin your work.

This establishes you at once on good land in the early fruit district of the upper Sacramento Valley, and assures crop returns the first year. Every one who wants a farm should investigate this offer. Write to.

Rust

Have been troubled with what appears to be rust or yellowing of the leaves on many of my plants. Will this hold over and if so how can I control it? Wistaria Aquilegia is the most seriously affected.—Subscriber, Covina.

If this rust is yellow or shows so-called orange colored rust it should be pruned out and the branches carefully burned. This often affects blackberries and similar fruits very seriously. It will hold over and may be prevented when the leaves start in the spring by spraying with a weak solution of Bordeaux mixture. However, complete destruction of the leaves and branches showing it is the best treatment.

Pickling Limes

We have been requested by a subscriber at Santa Cruz for a method of pickling limes. If any subscribers of the Cultivator have had experience along this line we will appreciate hearing from them.

Geese

A subscriber at Little Rock, Los Angeles County, writes for information as to where geese can be purchased in large numbers, also, he wants to know price of goose eggs.

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Collecting Wages

A was employed on a ranch for a period of ten months by the day. Employer laid him off but refuses to pay amount still due. A drew small sums of money at intervals. Is employer liable for payment under state compensation act? In what way can employer be made to pay or what action must be taken to collect wages due?—Subscriber, Anaheim.

You may bring suit against the employer for the amount of your wages or you may file application with the commissioner of the bureau of labor statistics who has power to hear and decide disputes arising from wages earned in seasonable labor.

(The workmen's compensation act has to do only with compensation for injuries received while in employment of others.—Editor.)

Railroad Lands

Please inform me as to railroad lands. If for sale at the government price does the government stipulate that the railroad company must sell at the maximum price of $2.50 per acre? If I select a parcel of railroad land are they compelled by law to sell the same to me?—Subscriber, El Monte.

Railroad lands are granted by the government to the railroads at different times and under different provisions. The general maximum price is $2.50 per acre, but the question is too indefinite to answer accurately.

Ditch Right

A man owns property through which a ditch runs and farther down waters some 300 acres of land. The ditch was on the property of a water company, but was abandoned by the company though it was continuously used by one party who now is to be affected by the proposed closure of the ditch. This one man procured his patent on the basis of that ditch and has had water on his land and the uninterrupted privilege of using the ditch (though not all seasons actually using it), for the past eight years. Can ditch be closed without user's consent?—Subscriber, Porterville.

It would appear from your statement that you, together with your predecessor in interest, had acquired an easement over the land through which the ditch runs and are entitled to have said ditch kept open. If, however, you had a mere license to run your water through the ditch it would not ripen into a right. The best method to have your rights determined would be to bring an injunction against the party who is threatening to close the ditch and have your rights determined before any damages occur.

Collection on Lien

In September, 1914, I agreed with C tc plant 3000 orange trees, also have another account for labor of $150.00. On completion of work was paid only $90.00. C bought the land on contract and has failed to comply with his contract so that the original owner has started foreclosure. Is there any way that I can collect or hold the land for this amount?—Subscriber, Orange.

Any person who at the request of the owner of any lot or tract improved same has a lien for his work done and materials furnished; unless you are too late your proper proceeding would be to file notice of your lien at recorder's office of your county and bring suit against the person who employed you in addition.

Payment for Hay Sold

A sells to B 100 tons of hay, receives a small deposit and promise of balance soon. After several weeks A makes demand for balance but receives only part. After another few weeks A demands the full balance and receives a promise of payment on a given date, but on that date B does not pay the balance. Would A be at liberty to sell the hay to other parties? If B should go to stack and load his wagon could A refuse to let him move it until balance is paid?—Subscriber, Salida.

The seller of personal property has a lien upon such property for the purchase price, dependent upon possession. Upon failure to pay the purchase price the seller may sell the property for the account of the buyer, and if it is sold for less price than the buyers contract to pay, may hold the buyer for the difference.

Line Fence

A and B own neighboring farms with one-half mile line between. Both farms are enclosed by fence, the north half of the dividing fence is built and maintained by A, the south half by B. A sells north half of his farm, which includes the half of the division fence that he is responsible for, to C. I wish to know if A has any interest in the division fence remaining between him and B after he has sold the north half. Does C have to keep up all the fence between him and B or is a new division made giving B half of the north half between him and C and giving A half of the fence remaining between him and B?

If a fence separating the lands of adjoining owners is built by one of them entirely on his own land, it belongs to him, but if the fence is erected on the line belonging to each, as tenants in common, either may repair or if either destroys or removes he is liable to the other.

(In other words, once the fence is built on the line it is the property of both land owners and both C and A are entitled to a say as to removal and each should share with B in the cost of upkeep of fence between his property and theirs.—Editor.)

Unsurveyed Government Land

I am living on some of Uncle Sam's land and it was never surveyed until this last summer, but years ago there was a road declared that runs angling through it. Can I put the road on section line or on quarter line if it is more convenient? If so, how shall I proceed if the neighbors are not willing? Also I live on a slope where it is hard to get a well, so I went as low down the slope as I could to dig a well and the survey is east and north farther than anyone thought, so my well is on the neighbor's some ten feet. Can he stop me from using it or can he force me to pay a big price for it when he gets a deed for his place? I have done all the fencing. He agreed to do 80 rods but didn't have time, so to save my crop from his stock I had to build all of it.—Subscriber, Mas Doel.

The statement of facts is too incomplete to give any definite answer on any of the questions, but the following may be of some use to you, so are given: Any ten freeholders who are accommmodated by the road may petition the board of supervisors to discontinue the road or lay out a new road. The petition sets forth a general route of the road to be appointed or laid out and the names of the persons over whose lot the same is to run. Petition must be accompanied by bond, that in case the prayer is not granted the cost of surveying will be paid. Thereafter the road is by order of the board of supervisors viewed and surveyed. A report is made by the surveyors to the board and after notice given the board may either order the road made or reject the application. It is probable that your neighbors have acquired rights by use of the present road.

If you and your neighbor have agreed upon a boundary line between your property and upon the faith of that agreement you have entered upon and improved the lands upon your side of the agreed line, your neighbor could not thereafter dispute this line as the true line, but if this line was drawn by mistake he will not be stopped from ascertaining the true line as found by the survey, in which case you would have no rights upon his land.

If you and your neighbor have agreed that he would do 80 rods of the fencing and he nevertheless failed to do so, and you did the same, you can bring action to collect the value of the fencing done by you, which he agreed to do. Whether you could establish your case or not would of course depend upon whether you could establish the agreement.

FIFTH ORANGE SHOW

There will be two new competitors for world's honors in the Fifth National Orange Show, February 17 to 24, for Santa Barbara County and Oroville, which did not figure in the exposition last February, are both planning big exhibits.

Indications are that almost all of the districts which figured in the gorgeous display of 1914 will again exhibit in 1915. At least 90 per cent of California's crop will be represented.

Every Southern California orange and lemon district will construct beautiful feature displays, typical of their respective communities. In all 5,000,000 oranges will be used, it is now estimated. With big exhibits from northern California entered, Southern California will again have to defend its prestige.

The Household Department

THE NEW YEAR

Whisper "Farewell!" at midnight,
  To the Old Year whisper low;
Then open the Western door,
  Open, and let him go.

The work of the hands not good;
  The will of the wavering mind;
The thought of the heart not pure;
  The words of the lips not kind;

Faith that is broken or lost;
  Hopes that are fading and dim;
Love that is selfish and vain—
  Those, let him carry with him.

Whisper farewell to your doubts,
  To follies and faults that you know;
Then open the Western door,
  With the Old Year let them go.

Turn to the sunrising next.
  When shadows are growing thin
Set open the Eastern door
  And welcome the New Year in.

Welcome the order brave—
  "More faithfully do your part"—
Welcome the brighter hope,
  Welcome the kinder heart.

Welcome the daily work,
  Welcome the household care;
Clasp hands with the household love,
  Lift hands in the household prayer.

Forgotten be all mistakes,
  And over again begin,
When you open the Eastern door
  To welcome the New Year in.

A SURPRISE PRESENT

(Concluded from Last Week.)

Taking it off the chairs he drew a low stool to Grandmother's feet. "This is the one I used to sit on when I was a little tad while you wound the ball and told stories," he said, placing the skein in position on his hands. "Now then we're ready for business. Hope you've got some candy ready."

"Yes, I have," she laughed, as she began to wind. "A lot of it. I always make molasses candy for Christmas. Don't you remember?"

"Of course I do. And of all the candy that took the cake."

He rattled on, excited as a boy, till the skein was finished; then with another hug, and a resounding kiss, he was off.

Grandmother's eyes followed him till he was out of sight. Then she went to her bureau, knelt down and, having unlocked the bottom drawer, took out something which she patted and smoothed affectionately.

"Oh yes, surprises are very nice," she said to herself with a soft little laugh.

Just enough snow fell to make perfect sleighing, and at noon at Christmas day the happy load from Robert Deane's drew up at his brother Oliver's gate.

The door flew open and from the welcoming group Ned sprang quickly out, took Grandmother from the sleigh and carried her laughing and protesting into the house.

When all were inside, divested of their wraps and seated about the glowing fire in the grate, Ned disappeared. In a few moments he returned with his arm about a very pretty young woman who dimpled and blushed in most bewitching fashion as he marched her into the room and straight up to Grandmother.

"Here's my present to the family," he cried gleefully. "How's a new granddaughter for a surprise? Pretty good one, eh? Now let's see some genuine old fashioned hugging."

"Indeed you will," cried the pretty young woman throwing her arms around the older one.

"Yes, indeed," echoed Grandmother, drawing her new relative close. Ned looked on in high approval.

"Oh, you two will be good friends all right," he observed complacently. "I knew it from the first. Now Gerty, let Grandma catch her breath, and I'll introduce you to Uncle Rob, Aunt Nancy and the kids."

This ceremony over, he remarked, "I'll have something on the tree for everybody, but altogether they don't amount to a row of pins compared with my family present."

"Oh Ned, do hush," exclaimed the present, blushing harder than ever.

"There won't be anything on the tree for Gerty but a bag of nuts and candy, because we didn't know about her in time," mourned Effie.

"Never mind, dearie," said the new sister, drawing the little girl to her. "Don't you see what a lot of nice presents I have? All these new relatives? And then I'll keep Ned company. He'll have to be contented with nuts and candy, too."

"Serves him right," grumbled Oliver the second. "He might have told."

"O Ned will have a pair of socks, you see if he don't!" shouted Robert Junior. "Grandmother had some ready, I'll bet!"

Everybody laughed, and Grandmother kept her own counsel.

They gathered at length about the big, beautiful tree in the front parlor, and by vote of the company Oliver the first was chosen to gather and distribute its motley fruit.

"To my dear Ned, from his loving Grandmother," was the legend on a package wrapped in tissue paper, and tied with bright ribbons.

Ned unrolled the parcel, and held up, not one pair of socks, but two, and the softest, finest wool. Such socks as these had never come from Grandmother's needles before.

"Why, Grandma, how did you happen to treat me so much better than I deserve this year?" Ned questioned, giving her a resounding smack. For answer she only smiled inscrutably.

And now the distributing agent took down another tissue covered parcel and read:

"To Ned's wife, from her affectionate new Grandmother."

Wonderingly the new bride undid the ribbon fastenings while all looked on in eager interest. In a moment she held up before their gaze two pairs of lovely pearl-gray silken stockings.

"Why, Grandma!" she cried, "you surely didn't—" then she examined them more closely. "Did you really knit these yourself?"

"Of course I did," Grandmother replied happily, her eyes shining like stars.

"Think of it!" Such a piece of work. O, I never can wear the beautiful things. I'm going to keep them always, and look at them every day." Then the feature of the case which had at first escaped her now presented itself. "But how did you come to knit

them? You didn't know Ned had a wife until he came home."

"Did you know, Grandma?" Ned demanded. "Had you heard in any way?"

"Well—no, not exactly," the old lady responded, her face expressing her keen enjoyment of the situation. "But when I read your letter telling about your finding such good fortune—something better than money, I didn't need anyone to tell me that you'd found a nice girl for a wife. I thought the rest of the folks were dreadfully stupid not to see it, too. But as long as they didn't I wasn't going to open their eyes. And I knew you were going to bring your wife home Christmas.

"Surprises are nice," she added, beaming upon the astonished young couple. "I always did enjoy them."—Farmer's Review.

THE AVOCADO

Kindly tell me how the avocado is used. If you can give recipes for using it in salads or otherwise I will appreciate it—Subscriber.

In Bulletins 61 and 77 of the bureau of plant industry, United States department of agriculture, and Bulletin 25 of the Hawaiian agricultural experiment station, United States department of agriculture, we find the following information regarding the avocado, with recipes for its use. We doubt not the subscriber may obtain copies of the bulletins mentioned without cost by writing for same.

Other recipes are given in a booklet, "Tropical Fruits for California," published by West India Gardens. A number of these will be published next week.

The avocado should not be used until the meat cuts smoothly with a teaspoon and is about the consistency of well-frozen ice cream. No one should attempt to eat the fruit after it has softened; a rancid avocado may well be compared to rancid butter.

The avocado is a salad fruit and its uses are as varied as those of other salad fruits or vegetables. One should not, however, deluge this rich fruit with oil nor overpower with condiments its mild, nutty flavor. Combined with lobster or other shell fish it is said to make a delectable salad.

The simplest way to use the fruit is to halve it, remove the seeds and dip out the fruit with a teaspoon. If desired a bit of salt may be added. Some use pepper in addition. The novice usually considers some form of acid necessary to add piquancy.

In Guatemala, Porto Rico, parts of Mexico, and doubtless elsewhere, the avocado is sliced raw and added to soups. Even a small piece of the soft pulp crushed in a plate of soup imparts a delicate flavor.

Salads

Cut the meat into cubes, mix with sufficient mayonnaise to coat well, serve on a platter, piled high in the center, and sprinkle over chopped hard-boiled egg.

AN AVOCADO SALAD MADE FROM A SINGLE CALIFORNIA GROWN FRUIT; TWENTY PER CENT OIL IN A MOST DELICIOUS AND DIGESTIBLE FORM.
Courtesy of West India Gardens

Divide in half and carefully remove meat. Add the yolk of a hard-boiled egg and one tablespoon of French dressing for each fruit. Press through a sieve and pile in the half-shells. Garnish the tops with the whites of eggs chopped fine, a sprig of parsley, and one small red pepper.

Combine sliced avocado, cucumber, tomato, and a few shreds of chili pepper and serve with mayonnaise or French dressing.

Sandwiches

Slice the fruit with chopped chili peppers or cayenne and place between thin slices of buttered bread.

Butter thin slices of bread, spread with a paste prepared of mashed avocado mixed with a dressing of oil, salt, tarragon vinegar and a little nutmeg.

Avocado Cocktail

Cut fruit into dice, or small pieces, and serve in glasses with cocktail sauce made of tomato catsup and lemon juice, seasoned with salt and pepper. Serve ice cold.

Avocado Ice Cream

Yolks of five eggs, one quart milk, green maraschino cherries, two cups sugar, four medium-sized avocados, almond and vanilla extract. Make a boiled custard with the milk, eggs,

and one cup sugar, and flavor with vanilla. Mash the fruit to a pulp with one cup sugar and flavor with almond. When the custard is cool, add the fruit and freeze. Serve in mounds with a green maraschino cherry on top of each dish.

THE GREAT DAY

By Edward S. Martin

Christmas is a lot of trouble. It is very, oh, very expensive! It is extravagant. It is tiring. But it is worth it all—all the money, all the effort, all the pains; for it is the great day in all the year. The Fourth of July, Washington's Day, Lincoln's Day, Memorial Day all stand for patriotism, and Labor Day stands for rest, and New Year's stands for a fresh start, but Christmas stands for everything: for the love of country and the love of man, for work and rest and a fresh start, for the life that is and the life that is to be, for hope, for joy, for civilization.

Moreover, it stands for fulness of life. It is no pinched-up festival. The full stockings and the full stomachs, with which some of us celebrate it, have a good deal of fitness, material tokens though they are of matters chiefly spiritual. "It is true," says a recent writer, "that Jesus Christ offers the example of an absolute renunciation of much that makes up the life of the greater proportion of mankind; but it is done for the sake of the life." For the sake of the life; that there should be more, not less; that it should be better to live and better worth living, but valuable and livable in spite of privation, or even at times by dint of it.

It was that enormous revaluation of life that came to earth on the first Christmas Day, that makes that day the most important in all human history; that makes the writer just quoted find it reasonable to aver that history, in the real sense of it, only begins with the birth of Christ, since the people that have not yet claimed Christianity have no true history, but a mere chronicle of ruling dynasties, butcheries and the like.

The great knowledge that it belongs to us to acquire is the knowledge of Christmas; what its spirit is, what it stands for, what was the new idea it brought to earth. Round that idea our present world revolves.

Our civilization is based on it, moving forward as it accords with it, hesitating or receding as it conflicts with it. The problem of our politics and of our economics is the infusion of the spirit of Christ into the relations of men. Of course that is an enormous task. Men have been working on it for nineteen centuries, and it seems sometimes as if they had only begun. There goes on interminably the conflict between "It is good to have, to rule, to compel," and "It may be better to forego, to serve, to yield." It is not having or foregoing that is important; it is that within us that is helped and developed, now by having, and again by going without. That is what is important—that which is within us.

Since Christmas came, the true measure of a man has been that which is, or may be, within him, and thereby has come an immense appreciation of the value of men. They are "hands" no longer; they are "masses" no longer; they are individuals, each with a great possibility of value. To ignore or neglect them, or fail in doing what we can to benefit them, may be to miss a treasure by oversight, and blear our own vision by failure to discern.

Perhaps that is why we make as much as we can of everybody at Christmas time, and neglecting our ordinary pursuits, give gifts where we can, spread feasts where we can, give such evidence as we may that everybody whom we can reach is important to us, and that there is love in our own hearts.

"Peace on earth, good will to men" seems a long time coming, but no one need wait for its universal sway. It has come to every one who feels it within him. It has been brought to earth, and there it is for the taking, and never was a time when reachers out for it seemed so many.

Merry Christmas to all of them, and to all mankind!—Edward S. Martin in Youth's Companion.

ONLY A PENNY'S WORTH

"Jimmy," said the gentle old lady, sadly, to the young imp who lay with a broken leg in the hospital, "the nurses tell me that you have been a very naughty boy."

"Yus, missus," acknowledged Jimmy, his sunburned face and tousled head half hidden in the pillow.

"But why?" came the gentle query.

"Can't 'elp it, missus," shamefacedly whispered Jim.

"Now look here," said the old lady, as she rose. "I shall be at the hospital again next week, and I want you to promise me to be a good boy till then, and if so you shall have a whole shilling."

Jim fervently promised, but, alas! all his old mischief reasserted itself, and he was sadly in disgrace when the old lady again visited the ward.

"Well, little man," she said, kindly, "I'm not going to ask the nurse if you have been a good boy. Tell me yourself. Now, do you deserve that shilling I promised you?"

Slowly Jim raised his great brown eyes to her face, and then lowered them again. "Gimme a penny!" he said, in a low voice.—Answers.

DESCRIBING LOVE

In "The Desert and Mrs. Ajax," by Edward S. Moffat, one of the characters, an American girl, thus describes love.

"Oh, Amy (she says), isn't it splendid when you love some one? You just want to sacrifice—and give up—and work—and be devoured by fire or drowned in ice water if it will do any good. Sometimes it makes you feel, oh, so strong! And then, almost right away, your knees get wabbly, and you just turn into a cobblestone inside. And one minute he's looking at you in the most wonderful way, and you feel as if you were floating on a lovely pink cloud, eating ice cream smothered in violets, and the next thing you know something terrible happens, and everything goes to pieces, and you see that he doesn't love you after all—and, oh h-h!"

NOT A SONG BIRD

Something went wrong with the mechanism of the elevator in an old-fashioned Southern hotel, and the passengers, six men, were imprisoned between the floors for three hours. They made themselves as comfortable as they could while they waited. Each one had told his choicest story, and finally some one suggested that they sing a song to help pass time away.

"You can sing, can't you, Sam?" said a salesman to the negro elevator boy. "Just lead off with 'Dixie,' and we will all join in."

But Sam did not lead off, as expected. "Ah can't sing, boss," he explained. "'Deed Ah can't. I know most men of my color can sing, but I couldn't carry a tune, no indeed. I couldn't carry a tune if some one should give me one all tied up in a bag!"

Mayer HONORBILT SCHOOL SHOES

WEAR like iron, give twice the service of other school shoes and cost no more. Made with double leather toes, strong pliable uppers and toughest sole leather obtainable. Seams sewed with extra rows of stitching. Perfect in fit and style.

San Francisco-Los Angeles Produce Markets

Los Angeles Market

LOS ANGELES, Dec. 23.

The prices given below, except where otherwise noted, are those made by wholesale or commission houses to retailers, and are intended to give producers the range of the market rather than an indication of prices which they will secure. Jobbers' quotations to producers are not given.

BUTTER

Butter has remained at last week's quotations without any change.

Prices to trade 4 cents above following quotations:

Creamery Extras	.30
First	.28
Country	.23
Ladle	.22

CHEESE

Prices to trade, 1 and 2 cents higher:

California Fresh	14½@15
Domestic Swiss	20@21
Eastern Daisy	18@18½
Longhorn	18½@19
Imported Swiss	36@38
Oregon Triplets	17@17½

EGGS AND POULTRY

The egg market was forced higher, as producers of this section started to ship their product to San Francisco, a condition made possible by the fact that the northern market was almost 10 cents higher.

Prices to trade, 3 cents higher than following quotations:

Fresh ranch, case counts	.48
Candled	.52
Northern Case Counts	.54
Petaluma-Santa Rosa	.55

Prices to producers:

Hens, lb.	.15@18
Roosters, old	.9
Broilers, lb.	.26
Fryers	.20
Roasters, lb.	.15
Turkeys	.18@20
Ducks	17
Geese	.16
Squabs, doz.	2.00

LIVE STOCK

The following quotations are f. o. b. Los Angeles on all stock:

Hogs, 175 to 200 lbs., per cwt.	$7.75

HAY

Under date of Dec. 19, Scott, Magner & Miller say:

Receipts of hay for this week were 1946 tons, last week 1736 tons, and the preceding week 1649 tons, thus showing a slight increase for the three weeks. Choice grades of hay are not in demand. Considerable interior alfalfa has arrived during the week. Straw is unchanged.

We quote the average wholesale prices on carload lots on today's market as follows:

Fancy Wheat Hay, lt. bales	11.00@12.00
No. 1 Wheat or Wheat and Oat	9.00@10.50
No. 2 Wheat or Wheat and Oat	6.00@8.50

Citrus Fruit Market

LOS ANGELES, Dec. 22, 1914.

The orange market is not quite so strong as last week, caused in part by liberal shipments and weather which prevents free handling of fruit when it arrives. A little southern fruit has gone forward from the southern end of the state, but most of shippers in the south prefer to wait until more perfect ripening of the fruit. It is probable two weeks will intervene before any general shipment. Tulare and Butte Counties will have practically everything off the trees before January 1.

Lemons are still low, although quotations are slightly above last week's. Importations are being lessened and California is shipping practically none at this time. The fruit now coming from the Mediterranean aggregates only about 35,000 boxes. On this date last year there were 175,000 boxes.

Shipments

Shipments of oranges from Southern California to date since November 1, 1914: 787 cars, lemons 440; total 1227. Last year, same date, oranges 724, lemons 190; total 914. From Tulare County this season, oranges 3494, lemons 81; total 3575. To same date last season: Oranges 3505, lemons 11; total 3516. From northern counties: Oranges 383; last year, 301.

CULTVATOR FRUIT MKTS ....

NEW YORK, Dec. 21.—Thirty-four cars navels, one Arizona navels, three cars California lemons sold. Market lower on California navels and lemons. Higher on Arizonas. Raining.

APPLE CULTURE

(Continued from Page 663.)

with an external irritant. Black Leaf 40 and other tobacco products, soap solutions, lime sulphur, and miscible oils are the most useful of the external iritants.

Spraying

To secure the best results from spraying requires a good pressure pump, and the extension rod eight to ten feet in length, equipped with an elbow coupling and a good nozzle. For general orchard work, a driving spray nozzle is more desirable than any type of mist spray nozzle. Under high pressure, and with a driving spray, every crevice and angle of the tree will be filled with the spray. While spraying, it must be borne in mind that only those portions of the tree sprayed with a fungicide are protected against the ravages of fungi; only those portions of the plant coated with poison, when consumed by an insect that chews and swallows its food, will kill the insect; and only those soft-bodied sucking insects are killed that are actually coated with the spray.

Thinning the Fruit

In order to secure well-formed fruit of uniform size, it is necessary to remove by hand as many of the young apples as we judge necessary to permit the remaining ones to develop to a good commercial size. With the fingers, or a good pair of thinning shears, remove all the diseased, wormy or otherwise damaged or mutilated fruit. Also thin to one apple to each alternate spur, if the set of the fruit is very heavy; otherwise leave one apple to each spur. Where fruit only sets on a portion of the tree, two apples may be left on each spur, provided the bearing spurs are not too close together. The bearing spurs should stand at least six inches apart. At the point of contact the color of a red variety will be rather light. Yellow apples mature much better, since the color of the fruit develops more uniformly. A serious objection to two apples on a spur is the loss from the codling moth, the point of contact forming an ideal place for the worm to force an entrance into the fruit. The worm has a habit of eating into each, perhaps to take his choice by flavor, ruining both specimens.—W. H. Lawrence, Arizona Agricultural Experiment tSation.

POULTRYMAN'S OPPORTUNITY

(Continued from Page 662.)

breed and perfect, being sacrificed this fall and winter. This war is causing feed to advance in price, but it will also cause eggs, poultry, and practically all other food products to advance in proportion. Poultrymen will be inclined to become freightened at the high cost of grains and sell off their stock so close that their business will be crippled this winter and next season. The price of eggs is going to be high beyond a doubt. The question with you ought to be, "How to get the egg." There will be a great demand next season for eggs and stock for breeding purposes. Our advice is not to decrease your flock in size so that your business will be crippled this winter or next season.

We have harvested the greatest grain crops we have had for years. Beef, mutton and pork are scarce and high and are rapidly advancing in price and continually getting scarcer. The world must depend upon the United States largely for its food stuffs. One of our own Missouri packing plants has received an order from Canada within the last few days for a million pounds of dressed poultry. Some of this we understand is for export to England. Take courage, my friends, for if I am not mistaken the greatest opportunity that ever offered itself to American poultrymen lies before you within the next two years. It will take these warring nations several years to recover from the effects of the war even if it should close now.

We do not advise overdoing the thing. We would not keep a lot of surplus males not fit for sale or use as breeders. Do not keep a lot of drones, or deadbeats, or a lot of old hens that have outlived their usefulness. Get rid of all dead weight but do not become unnecessarily alarmed and sacrifice a valuable flock which is almost certain to make you good money before the next season has closed.—T. E. Quisenberry, Director, Missouri Poultry Experiment Station, Mountain Grove.

The next meeting of the Los Angeles County Horticultural Society will be held at No. 237 Franklin Street, Los Angeles, Tuesday evening, January 5. It has been planned for the future, to have a paper read on a special subject. Mr. J. M. Grant, county forester of Orange County, will start these special features at the next meeting with a talk on Arboriculture.

"MOTHERHOOD"

We referred last year to a most beautiful calendar issued by the [illegible]-Bergtholdt Company of Newcastle. It has occupied the place of honor in this office during the last twelve months and is now to be replaced by another even more beautiful, a genuine work of art. It is entitled

"MOTHERHOOD"

"Not all great deeds that men have done
Not all the world's wisdom understood
Can match the laurel she has won
The wondrous crown of Motherhood."

If interested in deep well pumping you can have a copy of this book by writing for it. It contains information about the POMONA DEEP WELL PUMP, and also valuable data on irrigation subjects. When writing ask for "Catalogue No. 54C," and state the depth of your well and its location.

The Pomona Double Action Deep Well Pump

is of the plunger type with reciprocating plungers, traveling in opposite directions, the one with a slow up-stroke, the other with a quick down-stroke, and a substantial "lap," thus having the descending plunger in place ready to receive and carry its load before the ascending plunger has reached the end of its stroke, traveling a substantial "dead" distance together, the one receiving, the other giving up its load gradually. Cylinders, valves and all other parts are made of the best materials that money will buy, and are built to stand up under heavy deep well lifts and to give years of satisfactory service.

Pomona Hoists

—have been made by us for 12 years and give good satisfaction. Cranking shafts are on same level making it unnecessary for man operating it to reach up and down. Load always held safely in suspension. No pawls to throw out. Write for prices and further information.

Pomona Gates and Valves

are made by us in a complete line of sizes for use in cement pipe irrigation. Special valve catalog "C" will be sent free on request.

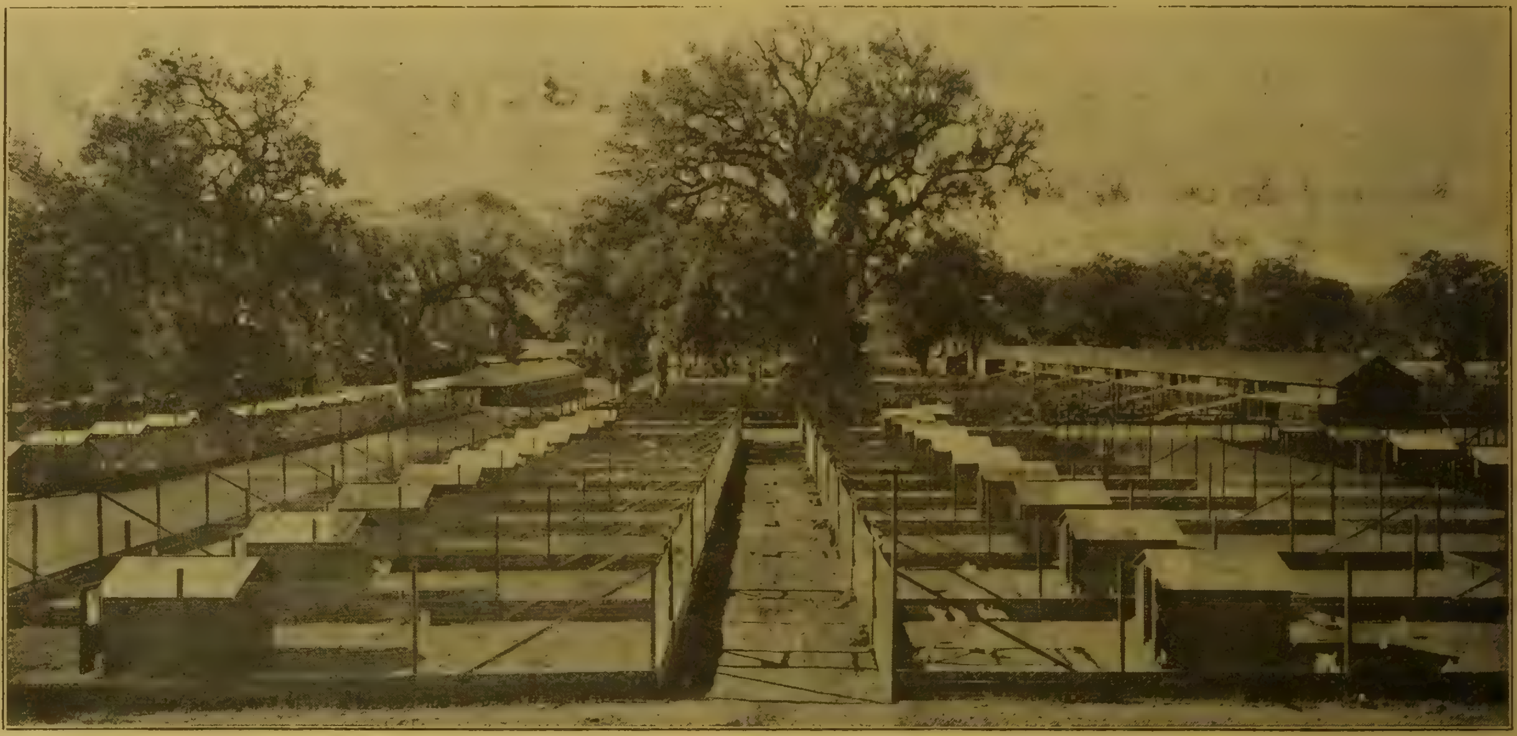
THE CULTIVATOR POULTRY BOOK

—Off Press in January



Published by The Cultivator Publishing Company after repeated calls for a thorough treatise on poultry, covering all the different branches and being of special benefit to the amateur on the ranch as well as the most complete and up-to-date poultry plant.

Written by—
JEAN A. KOETHEN

a graduate of the University of California, who is particularly interested in feeding and breeding poultry in its various branches in a practical way under climatic conditions as they exist in California. This book is written in a clean, clear cut style that will recommend it to every breeder of poultry whether he be a city-lotter or the owner of a large commercial plant.

Copy for—
THE CULTIVATOR POULTRY BOOK

has been read by experts, who pronounce it one of the most practical along poultry lines yet published. It calls particular attention to many difficulties that confront the amateur and experienced poultryman, and points out clearly simple methods of avoiding and overcoming them; contains 12 chapters, with over 200 pages of text and 50 illustrations, printed on egg-shell book, binding full cloth vellum de luxe, at the price of one dollar postpaid.

Vol. XLIII No. 27 LOS ANGELES: THURSDAY, DECEMBER 31, 1914 One Dollar Yearly

Riverside Secures Experiment Station

Point Some Two or Three Miles East of the City of Riverside Chosen. Present Headquarters will be Occupied Until New Buildings are Constructed. Over 400 Acres in the Plot, Much of Which is Hill Land and of Little Value Except as Experimental Grounds for Hardy Trees. There are Approximately 230 Acres of Fine Soil. $125,000 Will be Shortly Spent for Buildings and Improvements

FOR two years the search has been on for a site for the Southern California citrus experiment station. There was no dearth of sites for there were scores of them offered. The state legislature of 1913 had appropriated $60,000 for the purchase of the site and $125,000 for permanent improvements. The scores of offerings were soon narrowed down to a half dozen or less and these were reported upon by the advisory committee some months ago. The board of regents with whom final decision rested was deliberate however and for the past few months it has been generally known that the decision rested between Riverside and San Fernando. On Tuesday, December 22, final action was taken when the regents by a vote of 14 to four decided in favor of Riverside.

The site chosen comprises 477 acres some two or three miles east from the business part of the city of Riverside. The appropriation called for 200 acres of good soil, and more than that amount, or about 236 acres, is excellent soil of good depth. Riverside people guarantee a flow of 120 inches of water to the land. The hill or rougher land will afford opportunity for building sites, landscaping and testing grounds for various forest trees and shrubs while the more than 200 acres will give all the station will require for experimental purposes for years to come. The experimental work will not be confined to the citrus family, for while it has been termed a "citrus" station it is known that its scope will include practically all subtropicals. Its work has not been fully outlined but we know Dr. Weber's ambition is to make of it a great educational center where advantages offered nowhere else in the world may be had.

The present station at Riverside has but few acres surrounding the headquarters, a photo of which appears on the cover of this Cultivator. But for a dozen or more years certain fertilizer experiments have been conducted which will be continued till determinations are made. Also connected with the station is the pathological laboratory at Whittier. The large staff of scientists and experimenters is now fully organized and ready for the new station grounds. Dr. Herbert J. Weber is at the head of this staff. Californians have already sized up Dr. Weber as a doer of things large and will watch with satisfaction the work which will now be pushed.

We congratulate Riverside. It has fathered and mothered the citrus industry since its foundation. It is now generous to the state for the tract sold to the state for $55,000 is rated at double that value. The tract is known to be comparatively frostless and has typical citrus and subtropical conditions.

What the Other Fellow is Doing

Dr. Leroy Anderson Writes for Cultivator Readers of Some of His Observations on Other Folks' Ranches

LAST May when I was driving out southwest of Gridley in Butte County, I was told by more than one farmer whom I met that August Gattiker was one of the best farmers in the community. Accordingly I called upon Mr. Gattiker and found his operations to be mainly in this wise.

HOUSE AND PART OF GARDEN—TOMATOES IN FOREGROUND

He has 20 acres of a sandy loam soil, 14 acres of which are in alfalfa, five acres in peaches, chiefly cling for canning, and one acre for house and garden. His barn takes so little space from the cultivated area that he doesn't count it. And his house may be considered in like manner because fruits or vegetables grow on every side and close up, and attractive setting, too, as shown in the picture. Mr. Gattiker has owned the place four years, having purchased it as rough land, and he has leveled and planted it and constructed all the improvements. The original cost of the land including water right was $135 per acre, and he came with just enough cash to cover the purchase price, $2700. But of course he did not pay it all down for that would have left him nothing for improvements. However, in four years he has paid for the land, planted it all, put up the buildings, equipped the place and now has everything paid for and $600 cash in the bank.

As to buildings, his barn cost $500. It is 40 feet by 56 feet with hay storage in the center 24 feet by 40 feet and a shed on either side 16 feet by 40 feet. One side stanchions 13 cows and the other accommodates the three horses and the farm implements. The gutter behind the cows drains into a barrel just outside, and all liquid manure is collected therein. It is dipped from this barrel into another on a sled and hauled where needed. A hole at the bottom of the barrel lets out the liquid which is spread by means of a board fixed just beneath the outlet. This saving of fertilizer is indicative of a prosperous farmer if there were nothing else about the place to signify it.

The house was formerly the school house diagonally across the corner. The district became prosperous enough to build a new one and Mr. Gattiker moved the old one over and fitted it up for his residence at a very small cost.

A main ditch of the Sutter-Butte canal runs along one side of the ranch and the seepage from the ditch is such that very little surface irrigation is needed. The soil is of such a texture that it carries water readily and the ditch being full throughout the summer there is little need of applying more moisture. My recollection is that Mr. Gattiker said he does no irrigating at all, but any time during the year one will find moist earth just below the surface. He pays the water rent of one dollar per acre and lets the water go by.

BARN 40 BY 50 FEET, COST $500. ON 20-ACRE RANCH

The alfalfa is harrowed thoroughly every spring with a spring-tooth harrow, an aid in conserving moisture and an insurance for clean hay. A small area of green forage is grown. In May an acre of barley and sorghum was about ready to cut. The sorghum would make two more crops of forage during the season.

The chief market crop is cream from a dozen good cows. However in 1913 there were 25 tons of alfalfa hay to sell beside what the cattle and horses needed. Mr. Gattiker thinks he would be better off had he substituted alfalfa for his five acres of peaches. The sales of peaches in 1913 amounted to $250—not bad for so young an orchard. But the trouble is that now, as they are becoming profitable, the trees were hard hit by "sour sap" last winter and many died.

Citrus Trees
Exclusively

All Leading Varieties

REMEMBER, MR. PLANTER

Practically anybody can grow a citrus tree, but it takes years of experience to produce a tree that will prove a money-maker when it comes into bearing. Nice-appearing nursery trees are desirable and promising, but do not always prove to be good bearing trees in the long run. Plant for profit and not for appearance only. Our trees are straight, thrifty, well rooted and have strong, full heads, but the main consideration is that: Our buds are carefully selected from heavy fruiting trees and will prove true-to-name revenue producers.

OUR TWENTY-FOUR YEARS

of experience in the growing and handling of citrus nursery trees gives the buyer the advantage of starting out RIGHT, thus avoiding disappointment at the end of four or five years' labor in bringing the young orchard into bearing.

ANOTHER POINT TO CONSIDER

Growing a good tree is only part of having it do well after planting. Many a good tree is ruined in the taking up from the nursery and shipping. We give the best of service in the proper handling and delivering of our trees.

WRITE,

'phone or call on us before buying your trees. Tell us your wants and we shall be glad to give you the benefit of our wide experience as to planting, soil conditions, fertilizers, etc.

Our illustrated new booklet on citrus culture mailed to any address upon receipt of 25 cents.

Citrus and Tropical Fruits

AGRICULTURAL LIME

Written for California Cultivator

By P. L. McCreary

WHAT can be done to secure potash for 1915-16 if the European war is to continue? That is a question which is interesting thousands of Americans today and is a particularly pertinent question as related to the citrus grower.

Outside of Germany there are practically no deposits of potash in commercial quantity. The importation from Germany is cut off by reason of the war, no shipments having been reported since the first of September. Naturally the supply in this country has already been brought down to a very low point.

Now the successful production of citrus fruits is very dependent on the supply in the soil of readily available potash. The old theory that our soils in Southern California were so well supplied with potash by nature that the application of more potash would not be necessary has been largely disproved by actual practical experience in the field. The application of water soluble potash (commercial potash from Germany) has proved highly profitable to the growers and its use has been steadily increasing during the last few years.

It is then a question of the availability of the potash in the soil that influences the production of the crop, and it is for the purpose of pointing out to the citrus grower a way to render the potash in the soil available to plant life, and overcoming for the time being the potash shortage, that this article is written.

The general effect of the liberal use of lime (carbonate of lime) on the soil is well known. It is not necessary then to enlarge in this discussion on the beneficial effect brought about by the use of lime on the tilth of the soil—the increased action of soil bacteria, the better growth and decay of cover crops and the generally increased availability of the plant foods in the soil or which are added to the soil—all these points and many others have been proved time and time again by the various agricultural experiment stations, and these facts alone are sufficient to make liming a profitable investment.

There is another effect, not so generally known perhaps, and that is that the use of lime by a chemical reaction in the soil changes the insoluble potash over to a form that is soluble and thus available to plant life. This is particularly true in those cases where the potash of the soil is of felspathic or granitic orgin, as is the case with most of our Southern California citrus soils.

It will be interesting in this connection to note the following abstracts from agricultural station bulletins:

E. H. Jenkins and E. M. East, Bulletin 163, Connecticut agricultural experiment station: "The element calcium is a necessary constituent of plants; but as almost all soils contain it in sufficient amounts for their needs, the action of lime is not like that of a direct fertilizer. Indirectly, however, it is an agent by which insoluble potash is changed to a form available as plant food."

H. J. Patterson, Bulletin 110, Maryland agricultural station: "Lime has not only the effect of aiding in the formation of unions of potash which will be held in the soil, but it also has the ability to liberate potash from combinations which are locked up and unavailable to plants. This is particularly marked when lime is applied to land containing fragments of feldspar."

W. B. Ellett, Bulletin 167, Virginia agricultural experiment station: "Nearly all soils, especially clay soils, contain more or less of the plant food potash in an insoluble form so that plants cannot use it. Lime acts upon this insoluble potash and liberates it, making it available for the growth of plants, or, as it might be put, palatable to the plants."

These statements, official as they are, and backed by extensive experimentation, surely point out the way of overcoming the shortage in potash. We do not of course argue that this practice of liberal liming can be carried out year after year without depleting to some extent the soil fertility. What we do maintain is that the use of lime in the situation which confronts us today when times are hard and the potash supply largely cut off will be of great benefit to the grower.

It simply means drawing on the reserve supply of plant food in the soil and returning these fertility elements to the soil in the form of fertilizers or fertilizing elements later on when financial and crop conditions revert to normal.

As a rule a good type of agricultural lime may be cheaply obtained. It should not cost over say $7.00 per ton, delivered to shipping point. Used at the rate of one ton to the acre, this soil treatment should be easily possible for practically all growers.

We also have before us a few general summarizations from Bulletin 48, bureau of soils, being results of 13,000 experiments on 220 soils.

"As a rule the efficiency of complete fertilizer has been appreciably increased by the addition of lime."

"Complete fertilizer without lime gave 79 per cent increased crop yield."

"Complete fertilizer with lime gave 115 per cent increased crop yield."

"Lime has proven quite generally beneficial, being on an average more effective than both potash and phosphate."

"In the Atlantic and Gulf coast states, including Kentucky, Tennessee and Arkansas, for which a large number of observations have been made, and where the most of the important soil types have been tested, the soils with few exceptions respond in a marked degree to commercial fertilizers and lime."

Surely this is food for thought for the citrus grower, and it is a point which we believe has been given very little attention in this citrus section in the past.

The man who hitches his wagon to a star may be an "idealist," but he will go farther than the man who is driving a balky team.

SUCCESSFUL
PLANTING
REQUIRES
EXPERT
KNOWLEDGE

WE do not mean that all successful planting must be done by experts, but that expert information and advice should govern your planting.

What are the right varieties for your particular locality; the kind that will most likely yield the greatest profit (not now, but) when they come into bearing; what are the best methods of planting, pruning, irrigating, packing, marketing, etc.? These are points that should be determined by the experience of others.

ROEDING'S
Free Advisory Service

Our Mr. Geo. C. Roeding has had over 30 years' experience in this state and is probably the best known nurseryman on the Coast. His experience covers not only the growing of nursery stock, but all other points up to the disposal of the fruit. The benefit of this experience is yours for the asking.

When you buy trees from us we take a live interest in you and your orchard; we want to see every R. & W. planted orchard yield a profit to its owner and become a lasting advertisement for this Company. We will be glad to give you full information about our advisory service, free of charge or obligation, if you will call or write.

CITRUS
Trees

We have for this season's planting an exceptionally fine collection of all the leading varieties of

ORANGES
LEMONS
POMELOS
AVOCADOS

Our stock is guaranteed true to name, is grown under ideal soil and climatic conditions by experts, and is dug and packed so as to reach you in A1 condition. No matter how large an orchard you may be figuring on setting out, you will do well to get our prices and suggestions.

Olives and DECIDUOUS FRUITS

We also have a magnificent assortment of olives in all the best varieties, and can supply your wants complete in nursery stock of nearly every kind—apples, pears, plums, peaches, prunes, grapes, as well as ornamental and evergreen trees, vines, plants, etc.

WRITE US TODAY

Send us your list of probable requirements for prices and suggestions and ask for information about our free advisory service.

CANDIED-FRUIT MAKING AT LEGHORN

By Consul Benjamin F. Chase, Leghorn, Italy

Two of the six manufactories of candied fruits, citron, lemon, and orange (a specialty of Leghorn), were visited on July 1. The larger one employs between 35 and 40 men and women; the smaller one, 10.

The citron is received either fresh or in brine, generally cut in halves with the pulp stil in it, from Candia, Greece; Corsica or Calabria, in southern Italy. That in brine is in barrels of sea water. This water is drawn off and the citrons weighed and assorted, then placed in large hogsheads. Salt water is brought in tank boats from some distance out at sea and pumped direct into these hogsheads, which lie on their sides. The fruit is left thus until ready for final treatment and is preserved by the brine. This brine also acts as a purge and eliminates some of the acid of the fruit by absorption. The lemon and orange peels are received in the same way, except that the pulp has always been previously removed. All of the fruits are given practically the same treatment. The description herein is that observed in the treatment of the citron in the various processes through which it was being put.

Simple Processes Employed

The citron after being some time in the hogsheads of salt water is boiled in fresh water, and the central pulp is torn out by women and the rind or peel thrown into a tank of fresh water. The peel is afterwards placed in a syrup of about four per cent sugar, which is at the boiling point when the peel is put in, but is allowed to cool. It is thus treated eight or nine times, each time being placed in a stronger syrup, until the last is about 35 per cent of sugar. The containers for this syrup in one factory were wooden barrels and in the other earthenware. The peel is then put into copper vats or kettles and syrup put in and the whole boiled for from an hour to an hour and a half. More sugar is added to bring the quantity up to the standard required. It is then placed on wire netting to drain and dry.

If drained citron, as it is called, is the product desired (much of this being made for the British Islands), this is the final process. If candied citron is desired the peel is again boiled for a like period in a strong sugar solution. It is then, after cooling, draining, and drying, packed for export. This work is also done by women.

Imports Sugar—Exports Candied Fruit

White crystallized sugar, chiefly imported temporarily for that purpose from Austria, is used in all of the processes. The candied citron contains 72 per cent of sugar. The use of Egyptian sugar was common some years ago, but none seems to be imported at Leghorn now either temporarily or otherwise. The sugar is kept in storage under direct government control and issued to the manufacturer as desired. The customs authorities also keep officials in the various plants to check up the use of the sugar, as that used does not pay a duty, the candied fruit being manufactured for the export trade. The small amount used in Italy, which is stated does not exceed 1,000 kilos (or a metric ton of 2,204.6 pounds) a year, is employed in the manufacture of sienna cake. Between 80 and 90 per cent of the product manufactured is citron, the balance lemon and orange peel.

CITRUS CANKER

To secure information as to the citrus canker situation we wrote the Texas state department of agriculture at Houston, knowing this serious trouble had secured admission to that state. Mr. Ed L. Ayers, plant pathologist, answers as follows:

In Texas citrus canker is confined to that portion of the gulf coast known as the Satsuma section of the Texas citrus belt. It includes the territory south of Houston, from Port Arthur on the east to Bay City on the south and west. This section has many localities in which the citrus canker is not found but it is scattered at various places well over the territory mentioned. There is one infestation at Kingsville which is isolated and has been left at the request of the United States government, so that their specialist may study the nature of the disease. The disease has not been found in the round orange section, which extends from Kingsville south through the lower Rio Grande Valley. This round orange belt is larger than the entire citrus belt of certain southern states.

The citrus canker is easy to control on the Satsuma, and as it is only found in this section of Texas, the situation is very encouraging. It has been spread about on the citrus trifoliata to which it seems indigenous.

The following procedure has been adopted by us for its control:

1. Destroy all infected citrus trifoliata.

2. Destroy all grapefruit and other badly infected host plants not easy to give special attention.

3. Spray infected plants and those surrounding with 6-8-50 Bordeaux mixture.

4. Carefully remove and burn all infested leaves, wood and fruit.

5. Spray every ten days with 6-8-50 Bordeaux, or as often as weather will permit.

6. Keep close observation after treatment and remove infected leaves that may not have had the disease sufficiently developed at first to make it noticeable.

Together with the above outlined measures all precautions are taken to keep from spreading the disease about by adopting antiseptic measures.

The chief cause of alarm is the rapidity and ease with which the disease is spread.

LIME
TREES

WE are digging our citrus stock now and the trees are splendid. We never handled or grew finer trees. They are of large caliper, well branched and absolutely free of all insect or fungus pests. We have about 75,000 trees to dispose of during the coming season which accounts for the low prices at which we are offering them: Oranges, Navel and Valencias; Lemons, Eureka; Grape Fruit; Limes. These are not "cheap" trees. They are first class in every particular but we are overstocked. The trees can be seen any time at our Nursery Salesyard back of the big store.

We also carry a full line of ornamentals, parking and street trees, roses and fruit trees. We invite your inspection.

Deciduous Fruits

THE FAMILY ORCHARD

Written for California Cultivator
By M. Sharpe

A GREAT many people not engaged in growing fruit commercially wish a small orchard for family use. Such a man may have little or no knowledge of the different varieties best adapted to his wants, and either plants what some traveling agent may tell him to plant or the varieties that are used most extensively for Eastern shipment, they being better known but not always so desirable for the family orchard, owing to the lack of proper jellying and canning qualities, their value as shipping fruits being in a great many cases due to size, color and carrying quality.

Another mistake in planting an orchard of this kind is that one not acquainted with fruit varieties is liable to plant fruits that ripen too near the same period. The thing to strive for is then to plant an orchard of fruits best adapted for eating out of hand and for general home use, and which will extend over a long ripening season, which here in California, if proper attention is given to selection of kinds, means fruit for the home almost every day in the year.

Although engaged in the fruit business commercially, I have experimented with a great many varieties of new and imported fruits, many of which have proved worthy and are to be highly recommended both for shipping and home use.

Plums

The Japanese varieties of plums are not generally used for table purposes with the exception of the Satsuma, a red-fleshed plum and good for cooking. Of this species I would suggest, in order of ripening, Beauty, Santa Rosa, Formosa, Climax. Wickson, Gaviota and the Kelsey. These varieties are excellent for table purposes and will extend over a ripening season from May to September.

Of the European class for table purposes the Clyman, California Blue or Tragedy, Peach Plum, Jefferson, Yellow Egg, Green Gage, Pearl, McLaughlin and Sugar are the more common kinds, to be had of most any nursery.

Mr. Leonard Coates of Morgan Hill is now propagating in his nursery many recent importations from Europe, the majority of which I have thoroughly tested out and have found many of them to be highly satisfactory, not only for home use but for shipping purposes.

Of these recent importations or plums I would suggest for the table and for shipping also, the following: Blue Rock, Czar, Mallard, Swan, Heron, Denbigh, Femmonzi Late Orange, Decaisne Autumn Compote, Monarch, Admiral, Denniston's Superb, Guthries Late, Archduke, President and Primate.

To those who wish a sour plum the Curley and Black Diamond are sour enough. The King of the Damsons and the White Damson are good for this class of plum. For a very late plum the Uncle Ben will be ripe for your Thanksgiving dinner.

The above-mentioned varieties are all to be recommended for cooking purposes also. The Czar and Blue Rock are excellent for jellies and preserves, and the Uncle Ben makes excellent plum jam and is a very delicious all-purpose plum. The Americana or the native type of plum grown in the East, does not seem to do well here.

Of the freestone peaches for the table the Mayflower, Alexander, Opulent, Duke of York, Carman, Belle of Georgia, Foster, Crawford, Decker, Australian Saucer, Fitzgerald Niagara, Morris White Strawberry, Salway, Krummel's October and Bilyen's Late.

Peaches

Of the clingstones, McDevitts, Philips, Orange, Tuscan, Sims, Indian Blood and Red Bird are very good. The Red Bird cling is one of the most beautiful peaches grown.

The best canning freestone peaches are the Crawford, Muir, Lovell, Elberta and the late varieties.

Pears

Of the pears in order of ripening, Madeline, Doyenne de Ete, Wilder, Bartlett Howell, Bosc, Comice, Conference, Glout Morceau and Seckel are to be preferred. Most pears can be preserved but the Bartlett is generally used for that purpose.

Cherries

For the cherries, Chapman, Tartarian, Bedford Prolific, Guigne Annonay, Early Rivers, Doctor Flynn, Hoskins, Bing, Schmidt's Bigarreau, Royal Anne and Centennial are excellent and most of them will do for cooking.

Apples

As to the apples for the family orchard the list is very long and there are so many good apples it is difficult to state which varieties would be preferable in California, as we have so much variation in locality. In some parts the winter apple becomes a summer apple; in many parts of California the apple is not a success at all, and in others is preeminent. Therefore, the main thing is to obtain varieties adapted to the locality where one may dwell. The Delicious, Grimes Golden, Winter Banana, King David, Gravenstein and Spitzenberg are all high-quality apples.

Persimmons

In planting persimmons the Hachiya, Goshio, Tanenashi and Tamopan are the best. The native wild persimmon of the United States is very fine after having been frosted. There are also some hybrids between the wild native and the Japanese that are to be desired. T. V. Munson of Dennison, Texas, has developed three new hybrids which are very fine.

Pomegranates

For pomegranates, Spanish Ruby,

TREES TRUE TO NAME · The SILVA-BERGTHOLDT CO. NEWCASTLE CALIF. · PLACER NURSERIES
Clingstone Peach Trees
TUSCAN! Ours are the improved Round Tuscans —firmer, more symmetrical and uniform, Finer Grained, less subject to Wind-Fall and Split-pit, and preferred (to the extent of $2 to $5 more a ton) by canners to the oblong Tuscans commonly propagated.
PHILLIPS! We cut our buds from a block of trees that have proven an exceptionally good strain of this variety. Peach trees are always a safe investment—the demand is large, the price firm, and the profit good. What more can you ask?
THE SILVA-BERGTHOLDT CO., "Fruit Tree Specialists," P. O. Box A Newcastle, Cal.
TREES TRUE TO NAME · The SILVA-BERGTHOLDT CO. NEWCASTLE CALIF. · PLACER NURSERIES

Papershell, Sweetfruited and Sin Pepitas are the best. The Wonderful is a beautiful fruit but sour.

Oranges

The orange is too well known to be mentioned, although there are varieties grown in the southern states that are said to be exceptionally good, such as Parson Brown, Lue Gim Gong, Majorca and Pineapple.

CONTROL OF PLANT LICE

Dr. A. W. Morrill, entomologist of the Arizona agricultural experiment station, writes:

"I have received a clipping from a Douglas paper in which mention is made of injury to fruit and shade trees in the city of Douglas by species of plant lice or aphis. I have not received specimens of these insects, but from the description given I have no doubt that they are true plant lice. Plant lice may be controlled by spraying with several insecticides, among which are (1) nicotine extract and soap, (2) whale oil soap, and (3) common laundry soap. These are listed in the order of preference. 'Black Leaf 40,' 'Nikoteen' and 'Tobacine' are trade names for three of the best known concentrated tobocca extracts. The first named is used in Arizona as a sheep dip and is consequently more easily obtainable than the other brands. It is guaranteed to contain 40 per cent nicotine and is retailed in gallon cans at $12.50 and in half-pint cans at 85 cents. While 'Black Leaf 40' is especially mentioned herein, other brands of concentrated nicotine of equal strength may be substituted in the recommendations which follow. A teaspoon of this concentrated nicotine compound is sufficient for one gallon of spray. Soap should be used with 'Black Leaf 40' at the rate of one-half ounce in a gallon of spray. This is not primarily for the insecticidal value of the soap, but for the purpose of giving the spray better penetrating and sticking properties. Whale oil soap, hard laundry soap, or one of the soap powders may be used in the foregoing spray mixture. The first is the more effective, but has the disadvantage of an unpleasant odor. The soap should be dissolved in a small quantity of hot water, after which sufficient water is added to make one gallon. Add to this the teaspoon of 'Black Leaf 40.' This insecticide is not always immediate in its effects, but the thoroughness of the work can be judged 24 hours after the application is made. When whale oil soap is used, two ounces should be used in a gallon of water and when laundry soap or soap powders are used three or four ounces should be used in a gallon of water.

"For applying the insecticide to shade or fruit trees more than eight feet in height, I would advise the use of a 'barrel sprayer' or a horizontal hand pump. The latter are slightly more expensive, but are always to be preferred when there is any considerable amount of work to be done. With either one of these types of spray pumps, a 25-foot lead of spray hose is needed, also an eight or ten-foot brass-lined bamboo extension rod, with a nozzle and cut-off. For combating plant lice on small trees and for garden plants, a small hand sprayer is recommended. These are made in different styles and are known as 'Bucket,' 'compressed air,' and 'knapsack' sprayers. They cost from $3.50 to $15.00 for complete outfits. For small gardens the 'bucket' pumps are especially recommended on account of their comparative cheapness. The equipment needed consists of from two to four feet of three-eighths inch rubber hose (the longer length is needed for the 'knapsack' sprayer), a three-foot extension rod and a nozzle adapted to throw spray at right angles to the extension, enabling the operator to reach all parts of the plant. The extension rod should, preferably, be of aluminum. This costs 25 cents per foot, but gives far better satisfaction than the heavy gas pipe extensions. The 'cyclone' or 'side cyclone' nozzle is preferable for garden work. These are right-angle nozzles of practically the same design costing about 60 cents each.

yes—there is good profit in

OLIVES —*If You Plant Roedings' True Trees*

"See that crop of olives"

THE enthusiasm of Mr. H. G. Johnson, who planted his twenty-acre place near Clovis in 1902, and who was wise enough not to put all of his eggs into one basket, is infectious.

Careful attention to details was responsible for this profitable orchard, and only furnishes another apt illustration of the profits to be derived from a small acreage where the question of labor only cuts an important figure when the crops are to be harvested.

Neither you, nor I, nor anyone else, could resist the magnetism of Mr. Johnson when he caressingly stroked his olive trees with their load of magnificent fruit, and dwelt on the profits he was receiving from his orchard of four hundred trees. Here are his own words as to what his returns were:

"Harvested my first crop of one ton per acre when trees were four years old and sold the fruit for $50 per ton. In the fifth and sixth years my crop averaged about one-half ton per acre, and from the seventh to the ninth year it varied from a ton to one and a quarter tons per acre. The price and demand have been improving right along, for in 1912 I picked three and one-half tons to an acre, which I sold at $100 per ton delivered in Clovis, and in June, 1913, two and one-quarter tons to the acre, which were sold at $130 per ton, and shortly after the delivery of this crop I made a contract extending over a period of five years at this figure for olives averaging 11-16 in. and up. This year my crop, as you can see for yourself, is enormous, and the olives will grade up into the largest size. At the very least calculation, I will have sixteen tons of olives, and you can readily understand why I am proud of my olive orchard."

MR. H. G. JOHNSON OF CLOVIS, CAL., SHOWING A SAMPLE OF HIS 1914 CROP OF OLIVES. (Note the size of Olives compared with hand in oval on right.)

TREES

The Largest and Finest Assortment of fruit and ornamental trees, vines and plants on the Pacific Coast.

No matter what you figure on planting this season we can supply your orders fully and with first quality trees. Send us your list for prices and suggestions.

OLIVES ALL VARIETIES **PEACHES** HALE'S EARLY, ELBERTA, ETC. **ORANGES** NAVEL & VALENCIA

Apples, Pears, Prunes, Apricots, Walnuts, Almonds, Pecans, Lemons, Pomelos, Limes, Guavas, Loquats, Chestnuts, Figs, Cherries, Grapes, Berries, etc.

ORNAMENTAL TREES, VINES, PALMS AND ROSES

We have growing a magnificent assortment of ornamental stock of every kind and description. Our roses are field-grown and comprise all the best domestic varieties as well as many imported.

NEW 1914-1915 ILLUSTRATED CATALOG, NOW READY

Our new catalogue, fully illustrated and containing prices of all the stock which we have for this season's planting, is now ready. If you wish a copy send us your name and address and it will be sent you promptly—free.

THE CARE OF AN AUTOMOBILE

IN considering the car upkeep question, three things have to be considered, the driver, the car, and the road. A reckless driver may ruin a good car or bad roads may do the same, in spite of careful running. While the writer realizes that it would be advantageous to have upkeep figures given, it would be of no practical value as the cost of upkeep is not identically the same, even with the same make of car, or even the same driver, as roads and weather cut a big figure in fuel. It is well known that driving into the wind takes more gas than when there is none and the harder the wind the more gas required.

Different stretches of road also require different amounts of gas. However, more gasoline is wasted by faulty engine adjustment than any other way. Too rich or too poor mixture in the carburetor, missing cylinders, leaking or wrongly timed valves, and carbon in the cylinders all are wastes of power.

How to Test the Mixture

One of the best ways to test the quality of the mixture is to turn the engine over a couple of imes with the switch off and the throttle open, remove one of the spark plugs and hold a lighted match to the hole. If the mixture is too poor it will burn weakly or not at all, or if too rich will burn with a yellow colored flame. A mixture which is about right will explode, not burn.

Care of Carburetor

A carburetor adjusted for summer may not be just right for winter, but when once set should be let alone. If there is still trouble it may be dirt in the carburetor, faulty ignition or carbon in the cylinders. A carburetor should be flushed out often and if there is much trouble with dirt, the gasoline should be strained through a fine-meshed smooth cloth.

How to Locate Cause of Trouble

When an engine runs after the switch is turned off or knocks in the cylinder while running, it is a pretty sure sign of carbon. The spark lever too far advanced will also cause knocks in the cylinder.

The only satisfactory way of removing carbon is to take the engine apart and scrape the cylinders with the steel carbon remover, which can be bought for the purpose.

This will take some time, but if done carefully and methodically will not be very difficult. Put everything aside in just such order that you can get it back in just the way it was before.

Poor oil or too much oil is the cause of carbon, and while it is necessary for the cylinders to have plenty of oil, too much is just as bad as not enough. Only the best grade of oil should be used. It pays in the end.

Valves

Valves generally have to be ground every 30 or 40 days if the car is used steadily. On some cars the engine has to be taken apart to do this; on others there are plugs directly over the valve heads, which may be removed to get at them. The edge of the valve head should be coated with valve grinding paste, which can be bought in tubes, and turned back and forth with a short motion till the edge of the part and the valve show bright all the way around. While doing this, repeatedly shift the valve around so as to grind evenly. Be careful not to get any of the paste in the cylinders, as it will injure them. Valves seldom get out of time, but if they do, they had best be adjusted by an expert. It is too particular a job for one who is not used to the work.

Ignition Troubles

Most ignition troubles are confined to dirty or improperly spaced spark plugs. Excessive oil or too rich a mixture causes fouling of the plugs and should be remedied. Engines with magnetos have less trouble than those depending on batteries. Batteries should not be allowed to fall below 20 amperes, all wiring kept from getting oil soaked, or chafed, as this will soon cut through the insulation and cause a short circuit, as will also oil if it penetrates the insulation. The space between the points of the spark plugs should be between one-sixteenth and one-thirty-second of an inch, so as to give a thick spark.

An Overheated Engine

This may be caused by driving too long on low, too late a spark, or too rich a mixture. A clogged circulation may also be the trouble. Loss of power may be due to a slipping clutch if a leather-faced clutch, and may be oil soaked or may need a new leather. Disc clutches have to be kept oiled.

All hubs, differential and gear case must be well packed with hard oil. A mixture of half cylinder oil and half hard oil is good for the gear case. The main thing required to get good service of a car is to keep the engine tuned up in good order, and use reasonable care in driving. Better go several miles around a very bad spot of road and save the wear and tear on the car.

Tires

As to tire service, the important thing is to have good tires to start with. A thick-treaded casing and the thickest red inner tube you can buy are good insurance against trouble. A small vulcanizer is a good investment as all small cuts in the casing and all ordinary inner tube punctures can be repaired and is a great saving. Tires must be kept inflated till they stand up, well rounded under the load, if you would prevent tire trouble.—Farm, Stock and Home.

DISINFECTION OF DITCH WATER FOR DRINKING PURPOSES

Wherever ditch water is used for drinking purposes, its use is always attended with more or less danger from typhoid fever and dysentery. This risk can be considerably reduced by treating the water with hypochlorite of lime or bleaching powder, which can be purchased in one-pound sealed packages from any drug store for about twenty-five cents per pound. Water in cisterns may be treated as follows:

For 5000 gallons, place one ounce of the bleaching powder (so-called "chlorid of lime") in a vessel containing approximately two gallons of water; stir rapidly for about one minute; allow it to stand for five minutes so that the insoluble part of the lime will settle to the bottom; pour the solution into the cistern containing the ditch water, and by means of a long paddle stir vigorously so as to mix the hypochlorite of lime thoroughly with the water. After 30 minutes, the water may be used.—Walter G. Sackett, Bacteriolgist, Colorado Experiment Station.

Kirkman Nurseries

RELIABLE TREES AND VINES

We again solicit the fruit tree and vine orders of the planters of the West, knowing that nothing but the **Best** will satisfy the experienced buyer. Twenty-eight years of successful nursery business has proven the quality of

KIRKMAN TREES

and the treatment Kirkman accords his customers. Our steadily growing patronage has demanded that we grow more stock each year, until we now have more than **five million** trees and vines growing in our nursery plants in California and Arizona. A considerable portion of the stock in our nurseries, which will be ready for delivery this coming winter and spring, is already sold to early customers, but we still have a complete stock of all varieties of fruit trees and vines, as well as a general assortment of **ORNAMENTAL** and **SHADE** trees, etc., etc. What are you going to plant? We have it, without doubt, in large or small quantities. Illustrated price catalog on application. Please mention what varieties you are expecting to use.

KIRKMAN NURSERIES **2525 Tulare Street, Fresno, Cal.**

Garget

I have a cow that for the past two years has given lumpy milk before calving. One-quarter of her udder became caked and swollen and remained swollen for some time after her calf came. What shall I do for it?—Subscriber, Snelling.

Congestion of the udder causes lumpy milk and is called garget. Thick blood and too much feed causes it. Give her a physic as soon as the lumps appear or before if you think best, and another a week later. Use one pound of epsom salts, half a pound of common salt and a large tablespoon of ginger. Dissolve all in two quarts of hot water and when cool give at one dose. The following powders given later will put her in good condition and pay well for your trouble: Powdered gentian four ounces, powdered nux vomica three ounces, bicarbonate of soda three ounces and farina eight ounces. Mix and give a tablespoon in the feed once a day.

Warbles

I have two cows that have what appears to be large lumps all over their backs. On top of each lump there is a scabby hole. Inside is a fat white worm about an inch long and three-eighths inch thick. Can you tell me what conditions cause them to come and how to cure them?—Subscriber, Gilroy.

They are what are commonly known as warbles. They come from the egg of the warble or heel fly (Hypoderma lineata). The eggs are deposited on the hair during the summer and when licking herself the cow takes them into the mouth. Once in the saliva they soon hatch and pass down toward the stomach. From there, it is said, they work through the tissues of the body until they reach the back and remain there until spring or warm weather when they come out and drop to the ground. They burrow into the ground a short distance where they soon develop into a fly again only to come forth to lay more eggs. To get rid of them squeeze them out even if you have to make the hole a little larger, then inject a little turpentine into the cavity and squeeze it out.

Wire Cut

I have a mare that was cut on a wire, just above the ankle, about the middle of September. The wound has almost healed but her ankle is still swollen and seems stiff. Will you kindly inform me what to do for it?—Subscriber, Snelling.

First put on a poultice of coarse bran wet with hot vinegar. Let it cool until you can just bear your hand in it before applying it. Leave it on over night. Then wash clean and rub dry. Then apply once a day a lotion made by dissolving one ounce of chloride of zinc in two quarts of water. The lotion will do more good if warm when applied. Do not warm the lotion in a metal dish; use earthen or granite ware.

Goat Fails to Breed

I have a three-quarter Toggenburg doe which kidded January 2, 1913, but since that time has failed to breed. Can you advise any treatment which will bring about the desired result?—Subscriber, La Jolla.

If her age is not against her then reduce her in flesh until quite thin and try the following powders: Powdered gentian two ounces, powdered nux vomica one ounce, sulphate of iron one ounce and farina enough to make eignt ounces. Mix and divide into 94 powders. Give one powder in the feed every night.

WHAT THE OTHER FELLOW IS DOING

(Continued from Page 675)

Most men on a 20-acre place would think it most profitable to do all the work alone, but on this ranch a man is employed the year round at the annual wage of $350, in addition to board and lodging. It looks as though this labor were a profitable investment for the returns in vegetables and small fruits appear to pay the wages. When haying and care of stock do not occupy his time there is always some profitable employment in the garden.

Presented in detail, the financial side of this small ranch is as follows:

Capital

Land—		
20 acres, at	$250	$5,000
Stock—		
12 cows, at	70	840
3 heifers at	30	90
3 horses, at	150	450
2 sows, at	20	40
80 hens, at	1	80
Implements, machinery	......	350
Total	......	$6,850

Receipts, 1913

Cream	$ 900
Calves	50
Hogs	200
Fruit—Peaches	250
Tomatoes	100
Strawberries	100
Chickens	50
Hay, 25 ton, at $10	250
Total	$1,900

Expenses, 1913

Labor	$ 350
Taxes	40
Water rent	20
Other expenses (estd.)	180
Total	$ 490

Summary of the above:

Receipts	$1,900
Expenses	490
Farm income	1,410
Six per cent on capital	411
Owner's labor income	$ 999

In other words, after deducting the usual rate of interest from the net receipts of the farm the owner has approximately $1,000 to pay him for his labor. In addition to receipts as listed, the eggs and vegetables exchanged in Gridley paid grocery and meat bills of the family for nine months. The family consisted of four adults (Mr. and Mrs. Gattiker, an aged father and the hired man) and two small children. The family likewise had what fruit and vegetables were needed on the home table. This man had from 20 acres $1,000 in addition to a goodly portion of the food supply for six people. When I lived in a city I made some calculation of what this actually means in comparison to a city man's salary. In rent of house and for supplies purchased which this rancher picked from his land, I paid in cash $800. In short, the labor income of $1,000 on this ranch is equivalent to a salary in the city of $1,800, or $150 a month. The city man may have more conveniences about his home than the rancher here described, but these are more than balanced by the freedom of life and action which are preeminently a rural asset.

One point more. I learned of another man in that section who purchased 30 acres of land similar to Mr. Gattiker's, and paid the same for it as this 20 cost. This man still owes $1,800 on his place, and says he can't make the payments. He works out a great deal, and in doing so possibly neglects his own place. Maybe it is the man at the helm after all that tells where the ship is to land.

PLANT APRICOTS

Consider these facts—

Market—The entire world.
Demand—Steadily Increasing.
Supply—Grown commercially only in California.
Profit—From $175 to $300 an acre.

Weigh the evidence, and your own good judgment will tell you to plant

SILVA-BERGTHOLDT'S
Foot-Hill Grown
Apricot Trees

Prized for their thrift, hardiness, good root systems and freedom from disease.

Though we have an extra fine block of Blenheims, Royal, Newcastle Early, Moorpark, Routier's Peach, and Tilton on Apricot, Peach and Myrobolan Root, a shortage of good stock is expected this year, so order now and get choice trees.

FT. SCOTT & NEVADA LIGHT, HEAT,
WATER & POWER CO.
Nevada, Mo., Nov. 25, 1914.

Gentlemen:

In response to your inquiry as to the satisfaction the No. 28 Pomona Pump is giving us, we are pleased to state to you that we consider ourselves very fortunate in having discovered this pump. As you will remember, we tried out other makes of double-acting plunger pumps before purchasing the POMONA, and were compelled to abandon them on account of the severe service required by us and their inability to perform this service. Your recommendation for this pump has not only been fulfilled, but has been exceeded.

The last plan of lifting water we used before installing the POMONA Pumps was an air lift system, and we used a 150 H.-P. boiler for lifting the same amount of water that the POMONA Pump lifts with between 8 and 9 H.-P. applied to the pump. The saving has been almost equal to the price of the pump in the five months that it has been installed, and the pump has not cost one moment's inconvenience, and it has been less trouble to take care of than it was to take care of the air compressor alone on the air lift system.

We will take great pleasure in entering further into detail upon this matter with any prospective purchaser of your pump, because we are convinced that **you have solved the problem of pumping from deep wells.**

Yours very truly,
(Signed) J. H. DUNKEL,
General Manager.

Irrigation Forestry

HEAD DITCHING

Principles and Practices in New South Wales

THE object of head ditching is to supply a certain area of land with water for irrigation purposes. The dimensions of a ditch and the amount of water to be supplied should be the first consideration in connection with its construction. If the water is supplied only from one outlet, and a large area has to be supplied, the ditch must necessarily be a long one; and if, in addition, it is called upon to convey a large amount of water in a limited time.

Important Factors

Important factors are its size and the fall in the land through which it runs.

The first factor is, however, dependent almost entirely on the second. The greater the fall in the land the more the size of the ditch can be reduced.

Again, the service expected of a ditch must be governed to a great extent by the crop which it is intended to water. If the ditch is to be used for irrigating lucerne or fodder crops, it may be necessary to supply a maximum amount of water in a given time. If, on the other hand, it is required for the irrigation of fruit trees or vines, it will be necessary to irrigate by means of furrows—which requires the maximum of time in order that the land may have a chance to absorb as much water as possible during the irrigation, and insure the water soaking evenly over the whole of the area operated upon, a very necessary thing if uniformity in the matter of cultivation and subsequent growth of the crop is to be secured.

The Ideal Ditch

The ideal grade for a head ditch is about 12 inches to the mile—just sufficent to insure that the water will flow along its length without interruption. If the fall be greater there may be a tendency to scour out the sides of the ditch and difficulty would probably be met in drawing water off, since in order to get a satisfactory flow through the sluice boxes used in connection with the water distribution, it is necessary to steady the flow in the head ditch by means of checks. The steeper the fall the greater the number of checks required. The following figures, which have been prepared by Mr. F. H. Brewster, may serve as a guide, and may be taken as approximately correct:

Discharge of ditches having a fall of 12 inches per mile, and a side slope of 1 to 1.

Bed Width.	Depth of Water.	Discharge.	Acre feet in 24 hours.
2 ft.	1 ft. 6 in.	3.4 cusecs	6.8
2 ft.	1 ft.	1.5 cusecs	3.0
1 ft. 6 in.	1 ft. 6 in.	2.7 cusecs	5.4
1 ft. 6 in.	1 ft.	1.2 cusecs	2.4

The greater the fall the greater of course will be the carrying capacity of the ditches and vice versa.

A good maxim to follow in connection with the construction of head ditches is to err on the large side. Better a ditch too large than one too small; moreover, the large ditch has certain advantages which recommend it. In the first place the irrigator has something to come and go on in cases of emergency; and in the second place, when the ditch becomes partially choked with weeds, as is likely to be the case in a short time, the flow of water through the ditch is not lessened to such an extent as to interfere seriously with the proper irrigation of his farm.

With a fall of 12 inches to the mile a ditch not less than five feet on the top and 12 inches in depth below the surface of the soil, with side slopes of one to one, is recommended. A ditch of this cross section should carry from two to three cubic feet per second. Working this out roughly the amount of water supplied by such a ditch in 24 hours would be about four acre-feet, or four inches of water over an area of 12 acres. This should be sufficient to insure a satisfactory watering under ordinary circumstances. If the soil be light, in all probability more than this quantity of water would be quickly absorbed, but on the other hand in heavy clay country the soil would not be able to take any more than the quantity of water which such a ditch could supply in 24 hours.

These figures may be taken as a rough guide in connection with the construction of head ditches, for in the event of the fall in the land being greater than 12 inches to the mile, the flow may be steadied to whatever extent is desired by the provision of checks in suitable places. It should be borne in mind, however, that when the fall is less than 12 inches in a mile and it is not possible to increase the flow by raising the head of water in the channel supplying the ditch, the only means by which the amount of water can be brought to the normal figures given above is by increasing the size of the ditch itself.

Here again it is impossible to dogmatise, the circumstances varying so much in each individual case. The figures already given, however, as to the discharge of ditches of the various cross sections indicated, will perhaps be useful in this connection.

Making Head Ditches

Of all the methods tried on the various irrigation schemes in this and other countries, the cheapest way to make a satisfactory head ditch appears to be by means of a delver, an implement which is well known on all Australian irrigation settlements. The operations necessary to construct the delver ditch are as follows:—First of all the line of the ditch must be pegged out carefully. The earth to be taken out, a strip of about five feet wide, should then be plowed, the dead furrow being left in the center. The delver is then brought into use to remove or crowd out the plowed soil. In doing this care should be taken to push or crowd the soil from the first plowing well out so that after the second plowing (of the subsoil) it will be possible to bring out the soil from the bottom of the ditch and form a strong bank capable of holding the water it will be called upon to carry.

After the removal of the first soil the plow must again be requisitioned as above indicated to loosen the soil in the bottom of the ditch. It is only rarely that a third plowing and further use of the delver is necessary to deepen the ditch sufficiently for practical purposes.

It is generally necessary for the bank of the ditch to be strengthened by hand shovelling—the delver leaves a V-shaped ditch, and a bank with a feather-edged top. This may be altered by broadening the bottom of the ditch and putting the removed earth on the outer sides of the bank, thus strengthening it. Before widening the bottom in this way with the shovel it is always advisable to plow the sides of the ditch, thereby rendering the work of removal much easier.

Sluice Boxes

In this regard again a great deal depends on the purpose for which the ditch is to be used and the amount of water it is to carry. Taking the normal conditions referred to previously, 6 in. x 4in. boxes, 3ft. long, placed every 30ft. along the length of the ditch, should be sufficient for irrigating lucerne. In the case of trees or vines one box should be placed opposite each row. These boxes may be either 2in. x2in. or 2in.x3in. in aperture, according to the distance the water has to run in the rows and the class of soil to be supplied. With a short distance and stiff soils a small box would be sufficient—with a long distance and stiff soils the larger boxes would probably be necessary. In the case of more open sandy soils the large boxes would be necessary in any case in order to get the water to run any distance. As is well known, the sluice boxes are fitted with tin slides, by the lowering or raising of which the flow of water through the boxes can be readily regulated. Sluice boxes of this nature have not proved an unqualified success on the Murrumbidgee irrigation area, as it has been found almost impossible to altogether stop them from leaking without shovelling the earth behind the boxes. There is also a tendency for the water to creep along the outside of the boxes and gradually wash them out. This last trouble can, however, be minimized to a great extent by nailing strips of timber, 1in. x 1in., right round the perimeter of the box, about half way of its length—that is to say, under the center of the bank. These serve to break the flow or creep of the water, and prevent the tendency to wash out.

The leakage trouble cannot, however, be entirely overcome if ordinary boxes are used. Any number of suitable designs for water-tight boxes are procurable, but in every case they are expensive. It is considered that the most efficient system would be to install concrete sluice boxes, which could be made at a cost of approximately 5s. each. This is, of course, a matter of some expense, and in the case of most settlers on the irrigation area who are not too liberally supplied with cash at the present time, it is one of the things that can wait until the farms become reproductive. In the meantime, with care and attention, the ordinary boxes do well enough for all practical purposes.

Carrying Water Over Depressions

To carry water over depressions, what is technically known as a "fill" is required. That is to say, instead of digging the ditch out with a delver it is necessary to build the banks up well, taking little or nothing from the bottom of the ditch. Under these circumstances care must be taken to see that the made banks are particularly strong. Many ditches are capable of carrying the water for the first or second irigation satisfactorily, but they then fail owing to the bank subsiding or scouring. If a breakaway occurs the carting of earth to remake the bank is a labor of considerable difficulty and expense—moreover, the outrush of the water may do very serious damage to the farm before the flow can be cut off. This, of course, is a factor of considerable importance.

All of these troubles may be obviated if the bank be constructed well in the first instance. After a few waterings it solidifies, and there is little further danger. If the matter be not properly dealt with in the first instance, however, there is always more or less trouble.

Carrying Water Across Rises

Where ditches have to be cut through a rise, it is very necessary that the bottom of the ditch through the cut should be made the same width and the same depth below the surface of the water as other portions of the ditch. If the area of the waterway is reduced in any part of the ditch the carrying capacity of the ditch beyond that point is reduced to that of the smaller section. This is a point which is too often lost sight of by irrigators. It sometimes entails considerable work to dig out the large section of a cut necessary to carry the same amount of water as the ordinary part of the ditch so readily made with the delver. Unless the carrying capacity of the ditch through the cut be as great as that of the first portion, however, there is a lot of waste work in making the balance of the ditch to the proper size, as the water once retarded when coming through the cut will not flow at an increased rate when it again reaches the normal ditch, and the irrigation of the farm must necessarily be unsatisfactory, since the flow is less than is necessary. Very often settlers complain that their ditch is not doing satisfactory work—not carrying nearly as much water as it should—and on inspection it is found that the reason is the one stated above—namely, that the work of digging out the cut somewhere through a rise has been scamped.

Necessity for Keeping Ditches Clean

Too much stress cannot be laid upon the necessity for keeping head ditches well cleaned out. The job is very often a big one, but it is always worth while. The way in which the flow of water is lessened by weedy growths is remarkable. In many cases the ditches, which act satisfactorily while clean, fail to give anything like the requisite flow of water if weeds are allowed to choke them up.

Another argument in favor of cleaning out the ditches is found in the fact that if allowed to be overrun with weeds, the banks form a harborage for all kinds of pests. This fact has been foreseen by the authorities, and, under regulations in connection with the taking up of irrigation fams on the Murrumbidgee irrigation area, settlers are required to destroy noxious weeds. There are many weeds, however, which cannot be classed as "noxious" in the ordinary acceptation of the term. These perhaps do almost as much damage in the way above indicated as the better known and really noxious varieties.—Irrigation Record of N. S. W., Australia.

If the war-made depression in the cotton markets will drive Southern farmers away from the one-crop system, it will be worth millions of dollars to Southern agriculture.

A Tip on Almonds

On this continent Almonds are grown only in California. The American market alone demands *four times* the present supply.

With practically an unlimited home market and a monopoly of the product

Plant Almond Trees if you are seeking a real money-making investment. We have an extra fine lot of trees growing on Bitter Almonds, Peach, and Myrobolan Root, but as there is usually a shortage of trees on Bitter Almond, place your contract immediately—don't delay.

Wilson's Quality Trees

Are in heavy demand this season. The selection of buds from established bearing orchards, careful selection of seed, causing healthy, vigorous growth—THE REASON. The following letter is one out of many thousands we have received in the past:

Grass Valley, Calif., Dec. 7th, 1914.
Fresno Nursery Co., Inc., Fresno, Calif.
Dear Sirs: In January, 1912, I received from your nursery 210 walnut trees of three varieties, which I am pleased to say have yielded since the first year of planting, each variety bearing a few nuts of excellent quality and TRUE-TO-NAME. I never lost one single tree of your shipment. The 600 pear trees received at the same time as the walnuts are also very satisfactory. My trees have done so well that the local paper has given considerable space about the vigorous growth of my orchard.
Very truly, (Signed) GORDON S. MORGAN.

That tells the story.—Prospective Planters, give us an opportunity of starting you right by supplying strictly first class nursery stock. Send us a list of your requirements for quotations. Our large 52 Page Book describes all varieties of Fruit Trees, Grape Vines, Ornamental Trees and Shrubs, Palms, Roses, etc. We send this book free upon request. Remember we specialize on DECIDUOUS FRUIT TREES, CITRUS TREES, OLIVE TREES, FIG TREES, GRAPE VINES, and Hardy Ornamentals. Write us if you want the best that money will buy. Address

COTTON SEED POISONING

The North Carolina experiment station has been endeavoring to secure a remedy for poisoning of pigs which often occurs from feeding cottonseed meal. The station made one experiment with sulphate of iron, or the common copperas, taking two lots of pigs, six in each lot, feeding to each pig one-half pound of cottonseed meal and one and a half pounds of cornmeal daily, the ration being increased as the pigs grew. One lot was fed in addition a small quantity of copperas. The feeding was continued 13 weeks. Four of the six which were fed the cottonseed without the copperas died before the expiration of the 13 weeks, while the other two had a very unthrifty appearance and made an average gain of 35 pounds. The six which received the iron sulphate gained 55 pounds and all were in thrifty and apparently healthy condition.

The method of feeding the iron was to dissolve a pound of the copperas in 50 gallons of water, and a gallon of this solution was used in mixing each pound of the cottonseed meal. We believe this experiment has not been followed up sufficiently to justify general commendation of the process, but it is certainly worth some testing out on the part of California swine raisers.

FLOOD STUDIES

We have from Ford A. Carpenter, local forecaster for Los Angeles of the United States weather bureau, "Flood Studies at Los Angeles." This report has for its text: "The rainstorm of February 18-21, 1914, caused the most damaging but not the greatest flood in the history of Los Angeles. Railway and traffic were interrupted for a period exceeding 24 hours, bridges and roadbeds were destroyed, the harbor was silted, and some ranches and orchards swept bare. The property loss probably exceeded $3,000,000. This was offset many times over by the great amount of good this storm did in filling depleted mountain reservoirs, raising the level of the valley ground water, and amply soaking the hundreds of thousands of acres of agricultural land in the Los Angeles district."

The object of the publication is to give some of the contributing causes of this and similar floods. Dr. Carpenter goes into the meteorological causes of storms to a very limited extent and then touches upon monthly distribution of precipitation, relation between elevation and precipitation, distribution during a typical heavy flood, and then gives detailed history of the progress of the storm of last February. The paper is illustrated with several charts and one very beautiful half-tone of clouds due to cooling process of ascending air, with the Sierra Madre mountains in the background.

Dr. Carpenter is doing some remarkably effective work in the Los Angeles office, much of it being of a nature which is not down on his routine duties.

HAPPY NEW YEAR

Crop reports from California show last year's production of nearly all crops has been record breaking. Those crops which have not exceeded all preceding years have at least shown wonderful increase over averages. Rice and cotton have made the largest percentage of increase. Corn has likewise increased wonderfully; its increase over the preceding year was 300,000 bushels. Wheat increased 2,600,000, oats 1,100,000 and barley, our greatest field crop, increased over 11,000,000 bushels.

More satisfactory, perhaps, is to know what the total production is, so we give the following figures:

"The 1914 production of the different crops: Corn 2,160,000 bushels, wheat 6,800,000 bushels, oats 7,700,000 bushels, barley 42,060,000 bushels, rye 136,000 bushels, rice 800,000 bushels, potatoes 10,350,000 bushels, sweet potatoes 966,000 bushels, hay 5,265,000 tons, cotton 37,000 bales, sugar beets 996,000 tons.

"Wheat sown in California this fall totaled 463,000 acres as compared with 421,000 acres last year. The condition is 98 per cent of normal, compared with a 10-year average of 91."

From the last sentence it appears that California is making some preparation to join the rest of the United States in feeding Europe during the next year. On the whole, California should have a most successful year, and we wish for every reader of the Cultivator not only a happy first day of the year, but a happy every day, and trust all will join in helping to make this the greatest year California has ever had.

DAIRYING IN CALIFORNIA

We have been given a look at the tenth biennial report of the state dairy bureau which is now in the hands of the state printer. It covers the two years preceding November 30, 1914, and gives cause for gratification by showing that dairying in California is increasing. For the year 1913 our total production of butter was 55,542,709 pounds. The figures show the next year's output to have increased to 59,286,460 pounds. Imperial County shows the most marked advance, rising to second place in the dairying counties of the state. Stanislaus not only holds her lead, but increases it, showing during the year 1913 a production of 7,541,900 pounds, and for the year just ended, 8,184,390. Humboldt County, formerly first in dairying in this state, has dropped to third place, producing last year 5,251,887 pounds.

In cheese production Santa Clara County takes the lead, with 768,100 pounds, Monterey crowding close with 728,111. Monterey County, however, showed a material decrease during 1914 over her production of 1913, while Santa Clara more than doubled its production over the preceding year. The cheese production of the state has decreased since 1903. In that year it produced over 7,000,000 pounds, while in 1914 the production was slightly over 6,000,000, though 1910, 1911 and 1912 showed a production down to about 4,500,000. Butter on the contrary has nearly doubled in production in the same period.

The report will contain addresses of all cheese factories and creameries and much other valuable information for every dairyman in the state. We doubt not it will be mailed to all dairymen requesting it of the secretary, F W. Andreasen, Berkeley.

PROFIT AND LOSS

Superintendent of Advanced Registry, M. H. Gardner, of the American Holstein-Friesian Cattle Club, is sending to the world information as to record secured by Tilly Alcartra, of whom Yolo County, California and in fact all the United States is proud. Her record has been given very completely in a former Cultivator but we wish to take one fact from Superintendent Gardner's report for the sake of preaching a two or three sentence sermon. Lest one fact be overlooked in the more extended report which appeared, let us mention that during no month of the entire year did this cow produce less than a ton of milk, and the twelve months' performance totaled almost 15¼ tons. To produce this world-breaking output she was fed during the year at a cost of $150, more than many cows and their entire year's feed, all told, are worth.

Another fact from Secretary Andreasen's report for the past two years under "Cost of Keeping Cows." —The cost of keeping a cow which yields 150 pounds of butterfat during the year is about as follows: Feeding, $30; milking and care, $24; interest on cost of cow, $3.50; depreciation, $5.00; interest on equipment, $3.00, or a total of $65.50. The income from her butterfat is $45; skim milk, $8.00; one calf, $2.00, or a total of $55. This leaves a net loss to the dairyman of $10.50. The other cow whose year's feed cost $150 was capable of turning that feed into profit to her owner, purely from a butterfat standpoint, of over $250.

All the dairy cows of this state cannot be Tilly Alcartras, but they certainly may be better than the average 150-pound cow, and the dairyman who is carelessly proceeding with untested cows is one groping in the dark and sure to be carrying some in his herd which, like the 150-pound cow referred to, are bringing a net loss every year. Milking is not an agreeable enough occupation to justify any farmer in paying so high a price for such diversion.

The Russian government has placed an embargo on all kinds of lumber, to prevent its exportation; walnut lumber, including Circassian walnut, much prized by American furniture makers, is specifically mentioned.

Agricultural Notes

President Menocal of Cuba on December 4 signed a decree prohibiting importation of citrus trees from any country, including Mexico. This is to prevent introduction of citrus canker.

The coming wheat harvest of Australia, on account of excessive drouth, is expected to be very small, being estimated at from 5,500,000 to 8,000,000 quintals as against 28,270,000 quintals in 1913-14.

Washington's first shipment of apples through the canal to New York was a 20-carload lot which was sent out the middle of the month. The water rate will be about half the former rail charge.

The Swiss farmers have long been complaining of the dearth of farm laborers. As a result of state investigations it has been determined that there is a dearth of day laborers in 74 per cent of the communes.

Fifteen butter and egg firms in New York City virtually control the prices of the two commodities throughout the United States, according to information made public by the state attorney-general's office, which is investigating the sale of butter and eggs in that city.

The census bureau has just completed a report dealing with the American negro and showing the part he plays in the agricultural industry of this nation. Three-fourths of all the negroes in the United States live on farms. There are 893,000 negro farmers in the United States and 673,000 of them are tenants.

Experiences with forest fires on the national forests this year show that automobiles, where they can be used, furnish the quickest and cheapest transportation for crews of fire fighters. Motor rates are higher than those for teams for the actual time employed, but the total cost per distance traveled and in wages paid to men in getting to fires is much less. The time-saving is self-evident; trips which ordinarily require two days time by team have been made by automobile in a few hours.

According to report of the International Institute of Agriculture the production of wheat in 1914 in the group of counties representing about 80 per cent of the total production of the northern hemisphere amounts in round numbers to 792 million quintals, against 872 million quintals in 1913. The 1913 production was, however, exceptionally large, so that compared with the average production for the ten years, 1903-12 (686 million quintals), this year's production is 106 million quintals, or 15.5 per cent above the average.

There is considerable discussion among the citrus fruit growers and shippers of Florida as to the advisability of using the bushel basket and half bushel basket, with wood cover and center support for the shipment of citrus fruit. There is no doubt that the bushel basket is growing in favor with the trade for the shipment of peaches and other fruits, and many Florida growers and shippers of oranges are willing to give it a fair trial. Many of the growers believe that the basket, particularly the half bushel basket, will materially help to increase the demand for citrus fruits as they argue that the consumer will buy a half bushel basket and carry it home when he cannot afford to buy a box.

Agricultural News Notes of the Pacific Coast

Northern California

Contra Costa County has shipped 500 cars of celery.

The Napa County farm bureau has a membership of 500.

Alturas, Modoc County, has subscribed stock for a cooperative creamery.

A large acreage of walnuts has been planted in Shasta County this season.

Several hundred acres will be planted to olives near Marysville, Yuba County.

The output of beans from Stockton is said to be in excess of 440,000 bags, valued at $1,320,000.

The Anderson-Cottonwood Irrigation System in Shasta County has been installed at a cost of $10.94 per acre.

The Durst Brothers have disposed of a large acreage of hop lands near Wheatland valued at approximately $1,000,000.

Members of the farm bureau, at Little Lake, near Willits, recently met and discussed the matter of a farm bureau adviser.

Yuba City, Sutter County, is testing an alkali-resistant peach root in very strong alkali land and finds it is succeeding admirably.

Sacramento reports that grapes marketed in kiln-dried redwood sawdust will bring to the growers of this state in excess of $400,000.

Incorporation papers have been prepared for the organization of the Sonoma County Hop Growers' Association with a capital of $500,000.

The California viticultural commission is experimenting in the preservation of grapes, one experiment consisting in keeping fruit in air-tight rooms filled with fumes of alcohol.

The Dairyville Dairy Association, of Los Molinos, Tehama County, has decided to continue operating its cheese factory instead of selling it, as recommended by some of the members.

Dairymen of Humboldt County are organizing a cooperative association. They propose to incorporate and secure a trade mark which shall be used only on best grade of butter. The idea is to build up a name for Humboldt butter which shall be the equal of any in the country.

A huge irrigation scheme has been suggested, which shall empound great quantities of water on the Sacramento above Red Bluff and reserve water sufficient for nearly 90,000 acres. The cost, if the scheme should be carried out, will be in the neighborhood of $23,000,000. Engineers have declared it to be entirely feasible.

The grange at Rutherford, Napa County, has elected the following officers: Master, H. Lutley; overseer, W. H. Bradley; lecturer, W. E. Cole; steward, C. Davis; assistant steward, J. Edington; chaplain, Mrs. C. Gardiner; treasurer, Edgar Dunlap; secretary, Miss Rachel Yates; Ceres, Mrs. C. Sanborn; Pomona, Mrs. W. H. Harris; Flora, Miss A. Davis; lady assistant steward, Miss L. Buttimer.

Central California

Kerman, Fresno County, will plant 100 acres of rice.

Porterville poultrymen held their annual show last week.

Hog cholera has appeared in Kerman, Fresno County.

Visalia shipped its last car of grapes and other fresh fruit last week.

Rabies has been reported among the dogs of Hanford, Kings County.

The navel orange shipping season of Tulare Country is practically ended.

A farmers' union has been organized at Riverbank, Stanislaus County.

Western Fresno County finds its dairy industry increasing very rapidly.

The free public market opened in Watsonville most successfully last week.

Salida, Stanislaus County, is the latest with a center of the farm bureau.

The Irrigation District Association of California convened recently in Turlock.

Stanislaus maintains its position as the great butter producing county of the state.

Australian horticulturists are investigating citrus culture conditions in Tulare County.

Many fig trees of the Fresno section are affected with some trouble said to be fig blight.

A carload of horses was shipped to European battle fields from Hanford, Kings County, last week.

The Water Users' Association of the Modesto irrigation district will meet on January 7 in annual session.

The apple crop of the foothills of Tulare County is reported as exceptionally short but of high quality.

Creameries near Hanford have paid to patrons for the first half of December from 35 to 39 cents for butter fat.

The Wood Colony near Modesto, Stanislaus County, has recently organized a branch of the farm bureau.

Watsonville, Santa Cruz County, has shipped 3,200 cars of apples. There yet remains slightly over 200 cars to go.

Visalia is endeavoring to secure a one-day session of the National Irrigation Congress which meets in California in 1915.

A proposition is under way to organize lands at Lindsay, Tulare County, under the Wright irrigation law and secure a gravity water system.

The state attorney-general has commenced action to quiet title to large tracts of land lying in what was formerly the bed of Tulare Lake.

Railroad people are putting up a claim for increase in minimum carloading requirements for oranges and wish to raise from 400, which now prevails, to 460 boxes per car.

The California Grape Protective Association recently met in San Francisco and discussed the effect of temperance legislation on the industry, and decided emphatically to divorce itself from any connection with saloon interests.

Southern California

Anaheim expects to ship some 600 carloads of oranges this season.

There is now much talk of an annual fair for San Gabriel Valley.

Many cantaloupes have already been planted in the Brawley district.

The Riverside Driving Club has been reorganized. M. I. Wheeler is president.

There is talk of another government investigation of the Lima Bean Growers' Association.

Irrigation was the principal topic of discussion at the recent meeting of the Oxnard farm bureau center.

The Elsinore Cured Fruit Association has just sold to New York brokers two carloads of dried fruit.

The Oxnard Courier says that over 100 acres of walnut trees in the section about Oxnard are being grubbed out to make room for lemon groves.

The Ventura County Bee Men's Association has requested county supervisors to reappoint W. H. Allen of Santa Paula as county bee inspector.

The Anaheim Sugar Company has received notice of the arrival of two shipments of beet sugar at New York, which went by way of the Panama Canal.

Investigation is being made as to possibility of making paper from bean straw. It is thought the straw will also make a fiber valuable for use as excelsior.

Hemet, Riverside County, shipped its first car of oranges November 19, the fruit at that date showing sugar test well above the standard required by the government.

The Piru Citrus Association has been organized with David Felsenthal, president; C. S. Johnson, secretary and manager; F. C. Chapman, U. F. Del Valle, A. N. Davidson and John Alcock, directors.

Practically all of the apple crop of the Oakglen district, San Bernardino County, is now in storage. Store houses have been built in the mountains where the natural cold will keep the fruit in best condition.

For the purpose of checking the spread of date scale a number of interested date growers of Imperial and Coachella Valleys are endeavoring to secure a state quarantine regulation of importations of date offshoots.

United States Horticultural Inspector Beers, who is inspector of Santa Barbara County as well, has been assigned an office in the new federal building at Santa Barbara where he will examine all shipments of trees, shrubs and other plant life on which inspection is compulsory, presented for mailing at the postoffice.

The greatest collection of citrus trees in the world is being brought together by the University of California at its citrus experiment station in Riverside. These will be experimented with to find and develop better varieties for California to raise commercially. This year 64 standard named varieties and 76 different minor varieties have been budded.

The Coast

Arizona is taking up the matter of farm advisers.

Onions are selling at Portland at $1.25 per hundred pounds.

Farmers of Rupert, Idaho, are experimenting with sugar beets.

Colorado sugar beet growers are demanding an increase in price.

The cotton gin at Yuma, Arizona, is operating to its fullest capacity.

Arizona quarantines against cattle from all sections excepting California.

Lewiston, Idaho, reports its last livestock exhibit as the finest ever.

Chandler, Arizona, is elated over its winnings at the recent Arizona poultry show.

New Mexico is quarantined against cattle importations from any source outside the state.

Yakima apples shipped through the Panama Canal reached New York in excellent condition.

The farmers' short course at the University of Arizona, Tucson, is to be held from January 3-16.

Oranges from the Yuma Heights section of Arizona have sold this year as high as four dollars per box.

Oregon reports the hop market advancing, the 12-cent price having already been reached at Portland.

Because of free wool and other discouraging features the Oregon Wool Growers' Association is discussing disorganization.

Students from the University of Idaho captured three first prizes at the recent Pullman hog show in the judging contests.

A church at Phoenix, Arizona, is to give a dinner of roast ostrich and a prize of an ostrich feather is to be given to each one who partakes.

Wheat growers of eastern Washington are complaining because of lack of snow and the subjecting of wheat crops to too much freezing and thawing.

The movement toward using school houses for social centers is being encouraged throughout the northwest, the grange especially using them for meeting places.

The newly elected officers of the Arizona State Poultry Association are, president, Ernest Hall; vice-president, J. F. Warner; secretary, H. G. Powers, Phoenix.

The agricultural experiment station of Arizona is being encouraged by farmers who are raising sufficient money to secure a farm adviser for at least two counties of the state.

A log raft containing 1,000,000 feet of cedar, said to be the largest ever floated on the Pacific, recently made the trip from British Columbia to Puget Sound. It was 100 feet long and 70 feet wide; it stood 15 feet out of the water and 20 feet under.

At the poultry show held at Spokane last week a special feature was made of an exhibit of capons, showing methods of dressing and preparing for the table. The idea was to make it an advertising feature to increase the demand for that excellent meat.

Don't delay buying a

DE LAVAL

Cream Separator

a single day longer

IF YOU ARE SELLING cream or making butter and have no separator or are using an inferior machine, you are wasting cream every day you delay the purchase of a De Laval.

THERE CAN ONLY BE two real reasons for putting off buying a De Laval; either you do not really appreciate how great your loss in dollars and cents actually is or else you do not believe the De Laval Cream Separator will make the savings claimed for it.

IN EITHER CASE THERE is one sensible answer: "Let the De Laval agent set up a machine for you on your place and SEE FOR YOURSELF what the De Laval will do."

YOU HAVE NOTHING TO risk, and over a million other cow owners who have made this test have found they had much to gain.

YOU CAN'T AFFORD TO wait till spring. Let the De Laval start saving cream for you RIGHT NOW.

WHY NOT START 1915 right with a De Laval and by spring it will have saved enough to go a long way toward paying for itself. Why not talk this over with the local De Laval agent? If you don't know him write to our nearest office.

LOOK OUT FOR THE YOUNG PIGS IN RAINY WEATHER

Written for California Cultivator
By Sacramento Valley Contributor

WE are all willing to admit that we have a much more mill winter season in California than in the middle west and that it is perfectly possible and feasible to have colts or calves or pigs or lambs dropped any day in the year with the assurance that with any reasonable care and attention they can be forced right along from birth to maturity without the serious setback that might occur in the east because of a spell of terribly cold, stormy weather at the time of or following birth.

But because of our favorable conditions and the fact that over a large part of the state we have little freezing weather and no extreme cold, as far as themometer readings go, we must not forget that a day of windy chilly rain may thoroughly chill a young pig and check growth to such an extent that a couple of weeks will be required to bring it back to its condition before the exposure.

In the Sacramento Valley we have had a long, dry fall and stock has needed little if any shelter so that this first rain caught some farmers somewhat unprepared to shelter all of their stock—as it always does. On a busy farm there are always just one or two more jobs to be done befor winter quarters are fixed up.

And when a farmer does find himself with a lot of young pigs that are forced out into the storm he should make a quick shift somewhere and get them in out of the weather. Older hogs do not mind storms like these first early rains; they have fat and bodily heat in reserve in sufficient quantity so that the rain does not chill them much, but it "shivers" little pigs right into the "marrow of their bones," it makes them "hump" their backs, their hair stands on end and they are just as unhappy and miserable as a little child with insufficient clothing. For hogs and human beings are very much alike in many ways. They have alimentary canals that are quite similar and their skins protect them from the elements in a less degree than the outer coverings of other animals. The fleece of a sheep, hide and hair of a cow or even a horse, offer a much more substantial "buffer" between the air and the sensitive inner tissues of the body than does the hide of a hog with its comparatively thin covering of bristles, and man has even less protection. The hair, fur or fleece of other animals is warm not only because of the thick coat, but because there is contained within the fibers of it a large amount of air which is a non-conductor of heat or cold and makes an added protection. The heat of summer and the cold of winter alike are transmitted readily through the hog's hair and hide to the tender parts of the body. This is why hogs require a "wallow" of some sort in summer so that they may cool off by the evaporation of moisture from the surface of their bodies, and the reason why they must be kept dry in winter—so that there may be no evaporation and cooling off.

As the weather gets cool in the fall the "wallows" that were the favorite haunts of hogs during the middle of the day, during July and August are deserted and they are found taking their after-dinner nap in some high, dry place.

In this country, however, and particularly in the interior valleys, all that hogs require during rainy weather is a dry bed to sleep in. The temperature does not fall low enough to require buildings constructed so as to keep out the cold.

HOW TO MILK

Which is the best method of milking, wet or dry hand, and why?

In comparing different methods of milking there are three things, I believe, which ought to be considered as being of the greatest importance, namely: cleanliness, its effect upon the cow, and rapidity.

The first named is the one which we need to consider the most, as it directly affects the quality of all dairy products for, without clean, wholesome milk, it is an absolute impossibility to bring out a good dairy product no matter what is done to it.

After milk has once become dirty it may be strained ever so much and the essence of the dirt will still remain in the mlk.

For this reason, dry-hand is better than wet-hand milking, because if all external dirt and dust is removed from the udder and teats there still remain some dirt in the pores which in wet-hand milking are washed and worked out, as it were, and is constantly being drawn down towards the end of the teats, where it will eventually join the milk.

The same holds true as regards the hands of the milker, for no matter how clean you may wash your hands, there always remains some dirt in the pores which will be worked out by wet-hand milking.

Also, in warm weather the hands will perspire more or less, and this perspiration will also join the milk in the manner described above.

Now, as to the effect on the cow of dry and wet-hand milking. To obtain the best results, the time of milking must be as pleasant to the cow as any other.

For this reason, too, I believe, dry-hand milking should be preferred, as it will irritate less the delicate tissues of the udder and teats. Also in cold weather the teats are not as liable to become chapped and cracked and consequently sore when dry-hand instead of wet-hand milking is used.

Then it is possible to milk a good deal more rapidly with dry hands than with wet. This may seem a mere trifle at first glance, but still if you only gained a minute's time per cow at each milking on a herd of fifteen cows, you would be one-half hour ahead each day, which, if summed up for the month and the year, would mean a considerable saving of time.—The North Western Agriculturist.

SALE OF DRAFT HORSES

At a meeting of the board of directors of the California Draft Horse Breeders' Association, held on Tuesday, at the Stewart Hotel, in San Francisco, it was decided to hold a sale of pure-bred draft horses at the university farm, Davis, on the 24th day of February, 1915. The horses consigned to this sale must conform to the rules and regulations of the state stallion registration laws as to soundness. For stallions 3 years old or over, evidence must be furnished that the horse is a breeder.

The object of this sale is to create if possible a permanent market for pure-bred horses. It is planned to make this an annual event, so that breeders will look forward to this affair as the best time to dispose of their surplus animals and that intending purchasers can avail themselves of this excellent opportunity to secure what they want. There is also need for some system of exchanging stallions between different companies from different localities. There are many small towns where a good horse is no longer especially useful because a great number of his progeny are located in the surrounding region. This sale offers a very great opportunity to sell such a hose and buy one which has proved himself a good breeder.

Entries for this sale will close January 15, and the names and pedigrees of horses to be sold must be in the hands of the secretary on that date. This is made necessary in order to give sufficient time to compile and print a catalogue.

The auctioneer's fees and advertising will be charged to the consignors at the actual cost so that no profits will accrue to the association on this sale. Any one in the state may submit horses whether they are members of the association or not. The terms of the sale will be cash. Everyone who is interested should send in his entries at once or should write to the secretary, J. I. Thompson, Davis, California, for the complete list of terms of sale.

PROFIT OF THE BUTTERFAT COW IN SKIM MILK PRODUCTION

An inquirer recently asked of one of the prominent papers what breed of dairy cattle he should choose for his dairy farm where the product from the cows was to be marketed as cream and the skim milk would be fed to the hogs. There followed this inquiry a statement of the claims of leading breeders for the breed they favored, and many of these claims were based on the economy of producing milk.

The following is a statement sent out by the American Guernsey Cattle Club:

As we understand the question of the economy of milk production the situation on the inquirer's farm would be something like this: The inquirer has each year as the product from his soil a certain amount of feed which he wishes to place upon the market at a price which will return to him the greatest net profit for the year and still keep his farm in a good state of fertility.

In the above instance the inquirer has chosen dairy cows and hogs for this purpose, generally accepted as a good combination, and wants to know which breed of dairy cows he should market his feed through in order to give the greatest return from his feed. Instead of comparing breeds in this matter the composition of Guernsey milk as compared with the composition of average milk will be used as a basis of determination.

Therefore, on the income side, if the inquirer is paid for his cream on a butterfat basis, he will get no more per pound than if he used average cows, but on the other hand, if he is so situated that his Guernsey cream gets its just dues he will get a premium price for this portion of his product. As to the skim milk, by feeding it to hogs he will get the same price per 100 or per pound as he would get for skim milk from average cows. Assuming that butterfat is the basis on which he is paid for his cream, it then becomes a question of the cost of production of butterfat and skim milk of the Guernsey cow over the cost of the same for the average cows.

Data from a large number of sources places the average cost of producing milk at $1 per 100 pounds. Milk is made up of several food elements, against which the $1 per 100 ought to be charged, namely—fat, sugar, casein, albumen and ash. Average milk will analyze about as follows: Fat, 5.5 per cent; sugar, casein, albumen, ash, 8.5 per cent, or a total of 12 pounds out of each 100 pounds of milk is solids. Then it costs, one might say, $1 to produce 12 pounds of solids, 3½ pounds of which is found in the fat and 8½ pounds in the skim milk, therefore, 3½ 1-12ths of $1, or practically 30 cents, will be the cost of 3½ pounds of fat, or approximately, one pound will cost 9 cents. The skim milk will then cost 8½ 1-12ths of $1, or in the neighborhood of 71 cents per 100 pounds. Think of it! Nine cents to produce a pound of fat with average cows for which he is going to receive anywhere from 30 to 40 cents, and 71 cents to produce 100 pounds of skim milk for which, if fed to hogs, he will receive at the most, figuring either on a corn or nutrient basis, 32 cents. Which would the inquirer rather have, the fat or the skim milk? Of course he must have them both together, as it is impossible to get the cheaply produced fat without getting with it a certain amount of the costly or money losing skim milk. It then becomes a question of what proportion of fat to skim milk will make the most profitable product to market, and Guernsey milk will now be considered as a comparison with average milk.

Wing tells us the average analysis of Guernsey milk is: Fat, 5 per cent; sugar, casein, albumen, ash, 10 per cent, or a total of 15 pounds out of every 100 pounds of milk is solids. Figuring the same as we did for the average milk, we find that Guernsey fat is produced at 7 cents per pound and skim milk at 66 cents per 100, or 2 cents less per pound for fat and 5 cents less per 100 for skim milk. In other words, the inquirer can produce a pound of fat from average cows at 9 cents and receive about 33 cents for it, while from Guernsey cows he can do the same and get from 33 to 50 cents per pound for it. He can produce skim milk from average cows at 71 cents per 100 and get 32 cents for it, or from Guernseys at 66 cents and get 32 cents for it.

We thus see that a large part of the cost of producing milk is due to the great cost of producing the skim milk, and since we cannot increase the cheaply produced fat in any cow's milk without a corresponding increase in the expensively produced skim milk, we must start with a cow that has a large proportion of fat to skim milk in order to get the most economical production when the marketing of cream and feeding of hogs is under consideration. — American Guernsey Cattle Club.

Warranted to Give Satisfaction.
Gombault's
Caustic Balsam

Has Imitators But No Competitors.
A Safe, Speedy and Positive Cure for Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a Human Remedy for Rheumatism, Sprains, Sore Throat, etc., it is invaluable. Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Dip for Potatoes

Please furnish formula for preventing scab on potatoes, also smut in grain.—Subscriber, Anaheim.

In the September 11 (1913), issue of the Cultivator are given formulas for the preparation of corrosive sublimate and formalin solutions for dipping seed potatoes to prevent scab. Of the corrosive sublimate (bichloride of mercury) use two ounces to 15 gallons of water. If it is desired to use the formaldehyde solution use formalin one ounce to two gallons of water. Formerly bichloride of mercury was the principal agent in preventing this scab. The seed was dipped for an hour to an hour and a half in a solution of the strength given above. More recently practically as good results have been secured by the use of formaldehyde and it is cheaper and much simpler to handle. Seed grain should be dipped longer than the potatoes.

Canker

Chickens have thick yellow substance that gathers on tongue and all over mouth. Their eyes swell. Tried to cure with coal oil. Am killing and burying all I find with these symptoms.

This is canker. You can probably cure it by swabbing out the mouth with pure hydrogen peroxide and then soaking with camphorated oil. Repeat in three days. If it returns after this treatment try swabbing with undiluted creolin which is a very powerful disinfectant. Whatever you do look for the cause of the trouble which may be mould germs in the scratching litter or feed or close air in the roosting house. Male birds that fight a good deal are more liable to canker than other birds because wounds where they have been pecked are easily infected, but there will be no canker, even in open wounds, unless there are germs somewhere to infect them. Clean up thoroughly and see that the birds are not overcrowded at night nor deprived of the pure air which they need even more than the rest of us.—J. A. K.

Stretching Wire Fence

In stretching woven wire fence if corner post is plumb and wire fastened properly does it make any difference in attaching the stretcher that the clamp which is bolted securely across the full width be two or more inches off of the square or right angle with the line of the wire? That is, where a single chain stretcher is fastened to the center of the clamp will either the top or bottom wire be tighter or looser because of this variation in the angle?—Subscriber Bishop.

There will be no difference in the tension of the top and bottom wires under the conditions named. It is presumed from your question that regular wire fencing is to be used having all the lengthwise wires running full length of the piece of fencing and straight. With chicken netting having only top and bottom wires full length and the other wires forming a diagonal, or diamond mesh, there is likely to be some trouble with sags in the netting which have to be taken out after the top and bottom wires are placed at the ends. This can be done by spreading the wires farther apart on the posts. Chicken netting made after the style of regular wire fencing is much the easiest to put in place and will hold its position better. —J. B. N.

Correcting Alkaline Spot

We recently had inquiry as to draining a small spot of alkali in the center of valuable property, where it would not be possible to drain into an open ditch. We suggested digging a shaft 12 or 14 feet to a gravel stratum underlying the land, and running tile into this. We asked Mr. J. B. Neff for further information and he suggests the use of a lberal amount of high-grade gypsum, say at the rate of even 10 or 1[illegible] tons per acre. Mr. Neff states that this with drainage will soon correct the worst alkali. He adds: "Of course, sufficient water must be applied on the surface to leach out all alkali."

Planet Jr.
Harrow: Wheel Hoe

Planet Jr. tools save time, lighten labor, and get bigger, better crops at less cost. Designed by a practical farmer and manufacturer with over 40 years' experience. Last a lifetime. Fully guaranteed.

Planet Jr. 12-Tooth Harrow

Stronger, steadier in action, and cultivates more thoroughly than any other harrow made. Non-clogging steel wheel. Invaluable to the market-gardener, trucker, tobacco or small-fruit grower.

Poultry for Profit

A WOMAN'S POULTRY PLANT

Written for California Cultivator

By Jean A. Koethen

POULTRY culture as a field for women long ago passed its experimental stage. Perhaps it would be nearer the truth to say it never had an experimental stage, for women take to the care of chickens as naturally as to the care of children. Women were the first poultry keepers. If they have not enough creative power to invent incubators or sufficient patience to work out the principles of mating and breeding, they have the housekeepers' instinct for cleanliness and the gift for mothering which is the first essential in the production of fine, healthy stock.

Half an hour's ride from Los Angeles I found the other day a woman's poultry plant so perfect in its arrangement, so spick and span in its immaculate cleanliness that I want to tell the readers of the Cultivator about it.

Three years ago the proprietor, Mrs. E. B. Martin, came with her husband to this 50-acre ranch, which was then bare land. Forty-five acres was devoted to house and grounds and orchard and garden, and the remaining five acres set aside for Mrs. Martin's poultry operations. How much experience she had had before this I do not know, but she must have understood the principles of poultry culture and the care of fine stock or she could not have built up the plant she has built up in three years.

A start was made with two choice pens of S. C. White Leghorns, and from this modest beginning has grown a flock of nearly 1,000 standard-bred birds. Mrs. Martin's aim from the first was to breed show and breeding stock, so she did not make the mistake of crowding her birds. Plenty of room and green range are the first requisites for symmetrical and vigorous growth, and the plant was planned to meet these essential requirements.

This plant is "different" in three ways:

1. The growing stock are kept from weaning time till maturity on alfalfa range.
2. All hatching is done by hens.
3. Houses are arranged with a view to the easiest possible cleaning and the greatest possible comfort for the birds.

The buildings and runs are arranged in five sections, exclusive of the quarters for mothers and baby chicks: The cockerel runs, which occupy the place of honor at the east side of the five acres; houses and yards for breeders; a large yard containing individual coops with covered runs for cock birds; laying houses; the pullet yard.

Believing as she does that the male bird is at least half the pen, Mrs. Martin gives more room to her young cockerels than to any other stock. When the young birds are taken from their mothers at the age of six weeks or thereabouts they are placed in small coops, 20 to a coop. These coops are built of shakes, with open fronts, but the front of each is protected from rain and sun by a canvas awning three or four feet long which is tacked to the house at one end and to a couple of stakes at the other. Under this are the water fountains and mash troughs. I was there the day after a heavy, driving rain, and the ground under these canvas awnings was as dry as if there had been no rain. This arrangement gives the birds an abundant supply of fresh air without drafts or dampness. A hover is placed in each coop at first so that the chicks need not roost unless they wish, but they soon find their places on the roosts, and the hover is then removed. From this time on the floor of the coop is kept covered with litter so that tht birds may scratch or cuddle as they please.

But the characteristic thing about these cockerel quarters is the large alfalfa run in which each coop is placed. Each flock of 20 has a run as large as an ordinary building lot, perhaps larger, set out to fruit trees with alfalfa between, and provision is made for irrigating the alfalfa, so that there is always new growth. Here the cockerels live literally "in clover," with unlimited range, and it is no wonder they grow up husky and vigorous. From time to time the birds which do not come up to standard are culled out for the table, while those of unusual merit are taken out to be shown or sold as breeders, so there may be only half a dozen in a run by the time they are full grown.

The yards allotted to the breeding pens, of which there are 12 or 14, are arranged in two tiers, one back of the other, and all fronting on a good-sized alfalfa run. It is impossible to give these birds range, but each pen gets half a day a week on the alfalfa run. In addition to this each pen contains a little bed of alfalfa covered with wire for the birds to pick at. A flat box for chopped greens is also provided and this is filled every morning. The birds nibble and scratch and often fill their crops so full of green that they have no room for grain. "If my birds only get enough green," said their mistress, "I don't care whether they get much grain or not."

The breeding houses are not open front, like the other buildings, but each has a large south window and an east door, so there is no question about ventilation.

The long laying house is on the roosting-house-scratching-shed plan, each house having accommodations for 50 pullets. The pullets are placed rather high up in the scratching room instead of below the droppings board, as is the case in many houses. In fact, there are no droppings boards, for Mrs. Martin has hit on what she considers a better plan. The roosts are quite high above the ground, and below them, where the droppings board is usually found, is stretched coarse poultry netting. The droppings fall through this and lie in the dust, where the birds cannot reach them until they are removed. The advantage of this plan seems to be that when it is not possible to remove the droppings daily—and it is rarely possible to do this—they are out of the way and too far beneath the birds to do any harm. Shavings are used for nest litter because the hens do not scratch them out of the nests as they do straw.

(Continued on Page 693)

Increased Production

The standard of poultry living and profit can be preserved and greatly increased by feeding

Coulson's Egg Food

When you take up a handful of Coulson's Egg Food you scarcely realize that you are looking at a dozen or two dozen eggs. But such is the case. The hen utilizes this food in the production of her eggs. It gives her the elements out of which she manufactures her product.

Coulson's Egg Food is not a stimulant—it is a food, and as such acts as an AID to egg production.

By insisting on Coulson's Egg Food—by refusing substitutes—you will be paving the way for a good yield from your flock, and at the same time giving your birds the VERY BEST at no additional cost.

Send for our free book, "Chickens." It is intensely interesting and instructive.

MISCELLANEOUS

St. Joseph's Agricultural Institute, Rutherford, Napa Co., Cal. An Agricultural High School for boarding students. A thorough training given in the theory and practice of diversified farming. The school is located on a thousand acre farm. The students assist in all the branches of work conducted on the farm, plowing, seeding, cultivating, orchard and vineyard work, dairying, hog raising, poultry raising, etc., thereby acquiring a practical knowledge of agriculture which is of equal importance to the theory. The Eighth grade is also conducted, as a preparatory class. The fee for board and tuition is very reasonable. Classes reopen on January 4th, 1915. For further information apply to the President, Bro. Thomas H. Claffy, S. M.

We are preparing to move from one of our warehouses to a new one, and find hundreds of items that we wish to close out quickly. Plows, Harrows, Land Rollers, Ridgers, Drills, Transplanters, Cultivators, Mowers, Rakes, Feed Cutters, Cream Separators, Milk Cans, Pails, Barn Equipment, Gas Engines, Scrapers, Vehicles, Wagons, Trucks, Garden Tools, etc. Prices sharply reduced. Write or call and see us. Newell Mathews Company, 200 N. Los Angeles St., Los Angeles.

Free for Six Months—My special offer to introduce my magazine "INVESTING FOR PROFIT." It is worth $10 a copy to anyone who has been getting poorer while the rich, richer. It demonstrates the REAL earning power of money, and shows how anyone, no matter how poor, CAN acquire riches. INVESTING FOR PROFIT is the only progressive financial journal published. It shows how $100 grows to $2200. Write NOW and I'll send it six months free. H. L. Barber, 430, 28 W. Jackson Blvd., Chicago.

For Sale—Alhambra, 25 minutes from Los Angeles, new modern six-room bungalow on good street, close to school and new public library. $3000 with $800 mortgage. Will take $300 cash, balance second mortgage. Addi A. Sexton, 423 S. Garfield Ave., Alhambra, Cal.

"Smith's Pay the Freight"—To reduce the high cost of living, send for our Wholesale to Consumer Catalogue. Smith's Cash Store, 112 Clay St., San Francisco.

Citrus Fruit Market

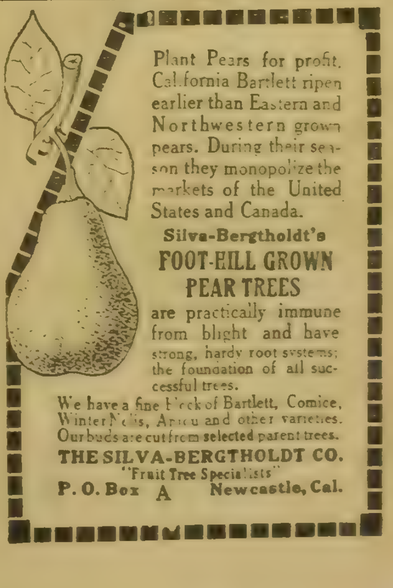
LOS ANGELES, Dec. 29, 1914.

The eastern orange market is badly shot to pieces by the extremely cold weather. Many cars are stored in roundhouses, but owing to the immense number, probably over 600, on track in various markets, such protection is impossible to any extent. Some fruit is freezing, many cars having the lower tier affected. With good market, buyers have consented to shading prices on the injured fruit only; at present they are demanding discounts on the entire car. Shipping is stopping, and it is hoped the condition will be corrected in a short time. If it is, north of Tehachapi fruit will practically all be forwarded before the end of next week. Florida's fruit is feeling the effect of the depression more than is California's. There were 30,000 boxes of Florida fruit sold in New York last week; these averaged $1.86, this against $2.30 last year. California fruit is averaging $2.07, as against $2.09 same week last year.

The lemon market is slightly improved; nearly all Californias are going into storage rather than take chances with the present weather.

Shipments

Shipments of oranges to date from Southern California since November 1, 880 cars, lemons 452, total 1332. To same date last year: Oranges 873, lemons 225, total 1098. From Tulare County this year: Oranges 4050, lemons 81, total 4131. Last season: Oranges 3683, lemons 15, total 3698. From Butte County this season: Oranges 431, last season 322.



Plant Pears for profit. California Bartlett ripen earlier than Eastern and Northwestern grown pears. During their season they monopolize the markets of the United States and Canada.

Silva-Bergtholdt's

FOOT-HILL GROWN PEAR TREES

are practically immune from blight and have strong, hardy root systems; the foundation of all successful trees.

We have a fine block of Bartlett, Comice, Winter Nelis, Anjou and other varieties. Our buds are cut from selected parent trees.

A NEW YEAR'S WISH

If I could wish a New Year's wish
  For all the world today,
It would be that no one need miss
  The joys along life's way.
As flowers hiding in the grass,
  So sweetest joys are found
Waiting to bless us as we pass—
  If we will but look 'round.

If I could give a New Year's gift
  For all the world today,
It would be eyes to see the rift
  In every cloud of gray.
As fire-flies shining in the night
  Make bright a little space,
So through each cloud a ray of light
  Shines in the darkest place.

If I could on this New Year's day
  Go forth to all the earth
And take a message, I would say:
  Seek out the things of worth.
As children make believe in play
  That they are queens and kings,
Begin today and think and say:
  I own all grand, great things.

So I would go to men and say,
  On this, the glad New Year,
"Life offers you all good today;
  Accept it now and here.
Keep in your heart the gift of love,
  And all days will be glad,
For love will lift your soul above
  The things that make life sad."

A NEW YEAR'S WISH

So may the New Year be a happy one to you, happy to many more whose happiness depends on you. So may each year be happier than the last.—Charles Dickens.

THE DEACON'S NEW YEAR GIFT

The winter was cold, and the deacon was lonesome; his fireside was bright, to be sure, but he knew that a bright-eyed woman would make it much brighter. So, as he got on his horse and rode over to town, he was thinking about who the woman should be.

His way lay directly by the cozy cottage of Miss Huldah Hopkins, and out in the yard stood Miss Huldah herself, feeding her turkeys, her cheeks round and red as one of her best apples, her eyes, oh, well! the glance of those sparkling black eyes as she looked up and said, cheerily, "Good day, Deacon Perkins," sent the thought straight into the good man's mind—"Now there's the very woman I want! The dearest one in the world, too—I believe I've liked her this ever so long, without knowing it."

So the bay horse stopped at the fence and the deacon said:

"Huldah, I want to ask you a question."

"Ask it, then."

"Will you marry me?"

"Marry you? Are you crazy, Deacon Perkins?" Huldah blushed rosier, and that gave the deacon courage.

"No, I ain't crazy, but I'm lonely over in that big house. Come, Huldah, I'll do right by you, I will, indeed. Let's begin the New Year together."

"Oh, no, I thank you, Josiah. I don't care to change my condition."

"You won't change your mind, Huldah?"

"Indeed I won't!"

"Well, I don't want any other woman. Say, make me one promise, do."

"I don't suppose I will. But what is it?"

"If you do alter your mind, just come and tell me, honest. Will you?"

"I'll think about it."

Huldah would say no more, and the deacon rode away. She laughed as she went into the house. "The silly man! To think of such foolishness, at our age! Marry, indeed! Not if I know myself."

She laughed when she woke, next morning and thought of it. "At least, I needn't be an old maid unless I choose to," said she. "But I do choose, of course. Wonder how it would go to get breakfast for two? Bah! I've got all I want to do to get it for one. I know men. He's like all the rest. Let 'em go hang, for all o' me."

It had never fallen in Hulda's way to hear a great deal of the goodness or otherwise of Deacon Josiah Perkins. So it seemed to happen rather oddly that she began to learn something of his doings that very day. First she met the minister and he said, Good morning, Sister Hopkins. A fine morning!"

"So it is, parson. You look as bright as if you'd heard good news, too."

"I have sister, I have. What do you think, that blessed Deacon 'Siah Perkins has paid off the mortgage on the church, right spang out o' his own pocket. Now we'll begin the New Year free o' debt. I hope Goodness'll send him a mighty fine New Year's gift—he deserves it, the dear, good man."

"He didn't get the one he asked for, anyhow!" said Huldah with a laugh to herself, as the parson passed on. "But that was nice of him, sure."

The very next day she found out that Deacon Perkins was sending the two orphan children of Tom and Mary Weathers to school, and that he gave the little brown cottage down in Coon Hollow to Old Joe Black and his lame daughter, rent free.

"Why, land! I didn't know he was quite such a fellow!" she said, "Coon Hollow ain't much o' a place, but some men would a' made all they could out o' it. Wonder if a body couldn't live sort o' nice with him? Sakes! What nonsense in a woman o' my age! I'll stop it."

She had other things to think of, the rest of the day. It was New Year's eve, and she always made a little secret trip to old Polly Dorson's shabby little house on that night. For several years somebody had been in the habit of going to Polly's New Years's eve, and leaving a generous gift for the rheumatic old creature. Huldah didn't want to be left out of all the charitable deeds, so for this time she had resolved that she, too, would slyly visit the little cabin, that night. It was bright moonlight, so who was afraid? Besides, nobody, ever interruptel anybody else, out there in Bird's Glen. Huldah filled her biggest basket with golden pats of sweet butter, two loaves of snowy bread, a glass or two of crimson jelly, and a fine fat chicken, ready dressed for the oven, and took her way down the Hollow and up Polly's little yard, to put the basket on the porch.

Just as she stepped up the old doorstone, she almost gave a scream, for ther, stooping down before Polly's door, was a big man in a long overcoat. But Huldah didn't scream, for she knew that coat—the moonlight showed it plainly and showed her, too the huge basket filled with red apples, fat potatoes, plump turnips and a head or two of prize cabbage.

"So," said she, "you are the gool angel who comes to Old Polly every New Year, deacon!"

"Well, I don't look much like a angel, Huldah," responded Deacon 'Siah. "Sort o' seems to me you're out on the same business ain't you?"

Huldah laughed, and answered, softly, not to arouse Old Polly, "I've only followed the example you set me—but I didn't guess who 'twas till now. Josiah Perkins, you're a real good man!"

"But you don't 'low I'm good enough for you, Huldah," said he, ruefully.

"Come, let's go, we'll wake Polly," was all the answer Huldah gave him. But when they were a few steps from the house, she said, softly still, "I begin to think I ain't good enough for you, deacon."

"Have you changed your mind, Huldah? Say—have you?"

Huldah laughed, went a step or two from him, and answered, looking back:

"I believe I have, 'Siah!"

Perhaps the deacon didn't catch up with her right quick, then! And perhaps—oh, well, what matter if one was thirty-nine, and the other half way over forty?

Polly had her New Year gift—and the deacon had his, too.

MORE AVOCADO RECIPES

In addition to avocado recipes given in last week's issue, the following are from Tropical Fruits For California, issued by the West India Gardens, Altadena.

Costa Rican Style

Cut the fruit in half and remove the seed. In the cavity place one tablespoon of vinegar or lime juice; salt and pepper to taste. Serve one-half fruit on plate, with spoon, to each person.

Diced Avocado

Remove skin and cut fruit in small squares. Add salt, pepper and vinegar, or any kind of salad dressing desired.

Mexican Salad

To two parts of the diced fruit use one part of chopped Bermuda onion; salt, pepper and vinegar to taste, Sweet peppers, red or green, may be added if desired. Prepare two hours before serving.

Cuban Salad

Cut small fruit in half and remove seed. Prepare a dressing of a teaspoon of sugar dessolved in the juice of a lime or half a lemon. In the cavity of the fruit place three stuffed olives and the desired quantity of dressing. Serve one-half fruit on lettuce leaf to each person.

Simmons Salad

Half a medium sized fruit, two cold boiled potatoes, half a small onion, one tart apple. Slice all very fine and place in layers. Pour over it two tablespoons of vinegar. Let stand a while. Just before serving add mayonnaise mixed with one-half tablespoon curry powder and one tablespoon sugar.

Havana Style

Take the meat of three avocados, add three tomatoes, first removing skin and core; add half a green pepper cut into fine shreds. Crush this mass to a smooth mixture and drain off liquid. To the pulp add a teaspoon of salt and a tablespoon of lime juice or vinegar. Use with lettuce as salad or as sandwich filling.

Avocado-Date Salad

Peel avocados and dice, adding an equal quantity of chopped dates. Mix with mayonnaise and serve on lettuce.

Hawaiian Sandwich

Remove skin and seed from one avocado. Mash the flesh; add salt, pepper and a dash of vinegar or lime juice and spread liberally on lettuce leaf between thin slices of bread.

Avocado Butter

Pare the fruit and extract the seed. Mash the meat smooth and rub in one teaspoon of olive oil to every two fruits. Season with salt and pepper to taste, and spread on bread.

As a Dessert

The avocado makes a delicious dessert cut in cubes and served with sugar and lemon juice.

A WOMAN'S POULTRY PLANT

(Continued from Page 689)

When the cockerels are placed in their runs de luxe, the pullets are placed in similar coops in a large alfalfa field. This field contains perhaps an acre, maybe more. At any rate it is so large that the birds never eat up the alfalfa though they run on it from infancy to maturity. This field, like the rest of the place, is set to fruit trees, and where other shade is needed nasturtium vines are trained over the fences.

All the houses and coops are arranged with especial attention to facility in cleaning. Roosts are removable. The cockerel and pullet coops are so small and light that they can be tipped back every few weeks and soaked with disinfectants and sunshine. The little coops for the old males, which are covered with tarred paper, have hinged roofs, the hinges being at the front so that every part of the coop can easily be reached. All roosts and joints and ends of coops and houses adjoining the roosts are painted every week or two in summer, less often in winter, with carbolineum, which Mrs. Martin considers the best of all mite preventives. The "mighty mite" has no chance whatever with such a housekeeper chasing him.

The baby chicks are all hatched by hens. Mrs. Martin pointed with pride to a yard containing 30 or 40 nondescript hens, mostly Buff Orpingtons and Rhode Island Reds. "These are my mothers," she said, and they certainly looked a good deal more motherly than the cold-blooded incubators which are the regular thing on Leghorn plants. The hatching is done in the sitting coops with wire-covered runs, which are recommended by several experiment stations. These coops are built, 12 in a set, of thick, substantial lumber, so that they may be removed to fresh soil for each new brood, and are kept in a field away from the quarters of the older birds. Each hen remains in this enclosed run with her brood until weaning time, when the young birds are removed to the cockerel and pullet yards, and the mother goes back to her house. No hen is allowed to care for any more chicks than she hatches, be the number what it may, and only 13 eggs are given to a hen except in the warm weather of late spring. These sitting coops are about 14 inches square, with hinged roofs, and the covered runs are about six feet long. While the hen sits grain is growing in the runs all ready for the baby chicks to peck at as soon as they are out of the shell.

The feeding on this plant is very simple. Mrs. Martin follows no fads. If she has a hobby, it is green feed and sprouted grain. The growing stock is fed sprouted oats or barley daily, and this, with an alfalfa run, gives them what they need most. A trough of dry mash is always before them, and a little grain is thrown in the litter or dug into the ground twice a day. No yellow corn is fed and very little corn of any sort. Wheat is the chief grain used, outside of the sprouted oats and barley, and the allowance is never cut down because of high prices.

If I should venture to mention the thing which most impressed me about this poultry plant it would be, I think, the mothering and petting which the birds receive. And those "wild" Leghorns respond like pet kittens. The big cock in the conditioning coop cuddled his head in Mrs. Martin's neck like a baby, and the pullets came to meet us, talking and singing as the gentlest of the heavy breeds would. Leghorns may be merely egg machines, as the saying is, but they have a friendly, affectionate streak which can be cultivated, and which, for their highest development, must be cultivated.

SO TACTFUL!

Two young women, strangers, met on a Pullman car. They discovered that they had several common acquaintances in the city where they both resided and they spent a very enjoyable half hour together.

"I am just returning from a delightful trip," said one of them. "I have seen a lot of people from home, too. Isn't it strange," she added, confidentially, "how glad we are to meet people traveling that we would hardly notice at home?"

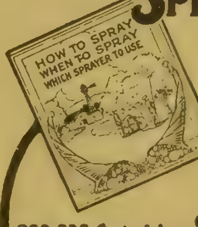
Bulbs

For fall and winter planting; also Flower Seeds for fall sowing. New Catalogue now ready, mailed free upon application.

NOW IS THE TIME TO SOW

Payne's Royal Exhibition Pansy Seed, the best strain on the Pacific Coast. Giant Perfection Stocks and Payne's Christmas Flowering Sweet Peas, all described in the above mentioned Catalogue.

THEODORE PAYNE
245 S. Main St. Los Angeles, Cal.



SPRAYING AND IRRIGATION BOOKS
FREE

Not mere booklets, but two complete up-to-date books, full of valuable data on these important subjects. No rancher should be without them.

228-238 Central Ave. SMITH-BOOTH-USHER CO. Los Angeles, Cal.

Great Family Combination Offer

We do not know of any Family Weekly that we can more heartily recommend to our readers than The Youth's Companion. It gives us pleasure, therefore, to announce that we have again arranged with the publishers to make the following offer:

The California Cultivator Regular Price $1 } Both Papers Together for One Year $2.50
The Youth's Companion Regular Price $2

TO TAKE ADVANTAGE OF THIS CLUB RATE SEND ALL SUBSCRIPTIONS TO THIS OFFICE

SPECIAL SALE of Farm Implements

Startling reductions in many lines. We are preparing to move from one of our warehouses into a new one and find hundreds of items that we wish to close out rather than move. Prices are sharply reduced for quick sales.

PLOWS, HARROWS, LAND ROLLERS, RIDGERS, DRILLS, TRANSPLANTERS, CULTIVATORS, MOWERS, RAKES, FEED CUTTERS, CREAM SEPARATORS, BARN EQUIPMENT, GAS ENGINES, SCRAPERS, VEHICLES, WAGONS, TRUCKS, GARDEN TOOLS, MILK CANS, PAILS, ETC.

We can only give you a rough idea of the principal items. Not all styles or sizes are included, but plenty for you to pick from. You can save money on almost everything you need—but remember, the quantities are limited. Make up a list of what you need and write or call and see us.

Please remember that we are not moving our office and salesrooms—merely one of our warehouses. You will still find us at the same old stand.

Newell Mathews Company
ESTABLISHED 1886

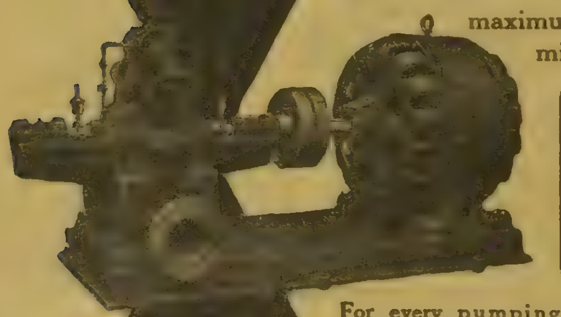
"Jackson MADE"

The fidelity and regularity with which a "Jackson Made" pump does its work is almost human—no attention is needed—it simply goes on pump, pump, pumping—hour after hour delivering the maximum amount at the minimum expense.

Tell us your pumping problems and our expert engineers will gladly help you free of cost.



Write for Catalog No. 48G

For every pumping condition there is a "Jackson Made," which, in satisfactory results, absence of repairs and costly upkeep, excels every other make.
